STATE LIBRARY.

Extract from the Political Code.

SECTION 2296. Books may be taken from the Library by the MEMBERS OF THE LEGISLATURE, DURING THE SESSIONS THEREOF, and by other State officers at any time.

SEC. 2298. The Controller, if notified by the Librarian that any officer has failed to return books taken by him within the time prescribed by the Rules, and after demand made, must not draw his warrant for the salary of such officer until the return is made, or three times the value of the books, or of any injuries thereto, has been paid to the Librarian.

SEC. 2299. Every person who injures or fails to return any book taken is liable to the Librarian in three times the value thereof.

No person shall take or detain from the General Library more than two volumes at any one time, or for a longer period than two weeks. BOOKS OF REFERENCE SHALL NOT BE TAKEN FROM THE LIBRARY AT ANY TIME.—[Extract from the Rules.]

☞The foregoing Regulations will be strictly enforced.☜

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, JANUARY 7, 1882.

VOLUME XLIV. Number 1.

New Mechanics' Society.

Several mechanics and apprentices held a preliminary meeting last Tuesday evening at the Nautical School, for the purpose of forming a mechanics' society similar to the well-known institutions of Leeds and Manchester. The main object will be the diffusion of useful knowledge pertaining to mechanics, which it is proposed to be carried out by the establishment of courses of lectures, and especially by the formation of classes of instruction in mechanics and allied studies.

The name decided upon at this preliminary meeting is the Pacific Coast Mechanics' Educational Association. A committee of three, consisting of Messrs. Arvidson, Hillman and Williamson, was appointed to draw up a constitution and by-laws and report on Friday evening. A class of 15 in elementary algebra has already been formed. Capt. E. McNevin was appointed President; Daniel Suter, Secretary; and Robert Moore, Treasurer.

At the first meeting, the matter was pretty thoroughly discussed by those present, and there was some question as to whether an association or only a class should be formed. When put to vote, it was decided to form an association.

It is proposed to meet on Tuesday and Friday evening of each week for class instruction, and on Thursday evening to attend the lecture. The first thing proposed is to teach the members something of mathematics, to give them a ground-work to enable them to understand mechanical problems. It is proposed also to have drafting classes as they go on.

A few weeks' time will determine whether there is a necessity for the classes, as such, to be carried on. It may be that some more general system of instruction will be found to work better.

This move is one which ought to have been undertaken long ago by the Mechanics' Institute of this city. This institution failing to do so, however, these young men have taken the bull by the horns and have started in for themselves. The membership fee will be only 50 cents per month. This is only a small beginning, it is true, but it shows the right spirit among those young men who take upon themselves the task.

It is as well for young mechanics and apprentices to consider in this connection, whether it would not greatly please their employers to find them joining such classes. We feel assured that it would, and that it would be beneficial to them in many ways. The difference between a workman who knows how to do it without knowing why, and one who knows how to do it and also why, is always recognized; and the latter will most probably end by simply telling how, and not having to do it himself, while the other will always have the hard work; as it always pays better to be the director than the operator.

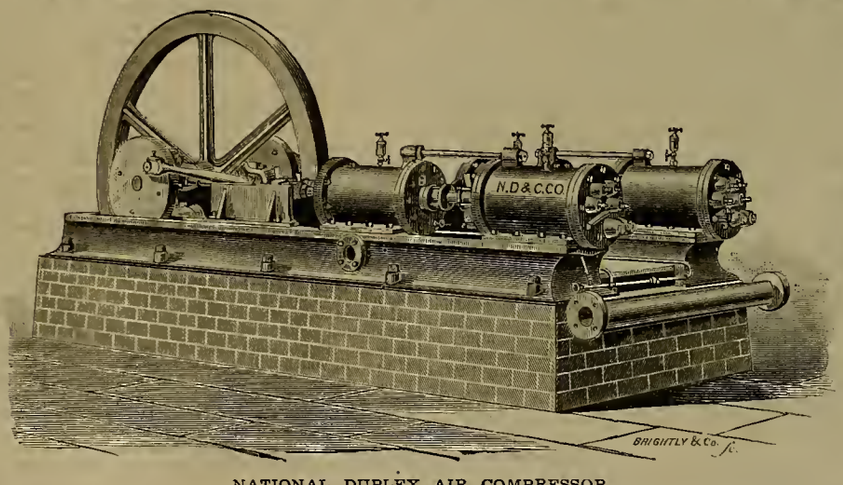
The St. Gothard tunnel is now open for traffic. The weak part under Andermatt, which has broken so often, is now thought to be permanently and securely protected against collapse. It is now proposed to connect the Adriatic with the Lago Maggiore by a system of canals, of which the termini will be at Venice and Maradino. This project presents neither financial nor engineering difficulties, and it will probably be actually accomplished.

The Christmas number of the Mining and Scientific Press, 32 pages, devotes considerable space to the mines and industries of Arizona, most of which is confined to Tombstone and the southern districts of the Territory. It has two illustrations of Yuma—one of the town and the other of the S. P. R. R. depot at that place. Of Prescott and the mining sections in Yavapai and Mohave counties it has the following to say: * * *—*Arizona Miner.*

The National Duplex Air Compressor.

The engraving on this page represents the latest improved air compressor manufactured by the National Compressor and Drill company, and for sale on this coast by Reynolds, Rix & Co., of this city. It is claimed that this machine will develop more power in proportion to cost and consumption of fuel than any other machine in the market. The size of cylinders on these machines range from 8x10 to 26x42 inches; larger sizes are made to order. The water circulation for cooling passes spirally around the air cylinder from the center to each end, keeping it perfectly cool without allowing the water to enter the cylinders. The air is thus always dry. The inlet and outlet valves can be removed without disturbing any of the other parts of the machine.

It will be noticed that there is an air compressor and steam cylinder on each side of the bed. A fly-wheel is mounted on the shaft common to both, making an evenly balanced machine. There are a number of these compressors in use on this coast. They have them in both the Empire and the Idaho mines, Nevada county, that at the latter mine being 18x36 in size.



NATIONAL DUPLEX AIR COMPRESSOR.

Employees of Mining Companies.—The Gould & Curry and Best & Belcher shaft employs a total of 68 men, Savage, 115, Hale & Norcross 59, Andes 10, Yellow Jacket 145, Imperial and Alpha 38, Kentuck 15, Overman and Caledonia 65, Forman shaft, 66, Alta 74; total in these mines, 657. The reporter has been unable to see Supt. Jones, and therefore the number of men employed in the Crown Point and Belcher have not been obtained. Of the number given above, 405 are employed in Gold Hill mines. Add to these the number employed in the Crown Point and Belcher, and the men at work on claims not listed in the San Francisco Stock Boards, the total number employed in Gold Hill district will not fall short of 750 men.

Col. Mendell, of the U. S. Engineers, says the Grass Valley *Union*, has appointed A. Larson, civil engineer at Dutch Flat, to take measurements and make estimates of the amount of ground that can be worked by the hydraulic process that has not been mined, on Bear and American rivers and their tributaries. In this manner an approximate estimate can be made of the amount of mining ground that can be hydrauliced and the time necessary to accomplish it.

The Carson and Colorado railroad will cause the making of mining discoveries and the development of mines in the region adjacent to it, which without its aid could not be made.

Burning Sulphur.

According to certain methods of burning sulphur, or material containing sulphur capable of being employed in the manufacture of sulphuric acid, a certain portion of sulphur is very liable to be volatilized. Henry Glover, of Silverton, Essex county, Eng., has devised an apparatus for effecting the entire combustion of the volatilized sulphur, and at the same time utilizing the heat that is produced from the entire combustion of the whole of the sulphur.

It consists in the employment of a mass of fire-brick work, or other suitable material, set pigeon-hole wise, or in any other convenient manner, between the burning plate of the furnace and the sulphuric acid chambers, or other apparatus, so as to form a reservoir of heat, in which heat may be conserved and any sublimed sulphur after admixture with the proper proportion of air to be burned. The air, previous to admission, may, if necessary, be heated by the waste heat of the burning sulphur, or by any other suitable means, and the quantity of air admitted may be measured by an anemometer, so as to secure the proper admixture of gases for any subsequent process.

By these arrangements a very high temperature is attained and at any convenient portion of the apparatus platinum or other vessels are placed in which sulphuric acid or other liquids are condensed. The details of the arrangement of the apparatus may be greatly varied, or produced without departing from the principle of the invention, which is in effect; the combination of the burning hearth of a furnace and the flues for the products of combustion with a reservoir, and pans adapted to be heated by said reservoir, and air supply conduits between the hearth and reservoirs.

The acting Attorney-General, on the 24th instant, in an opinion addressed to the President, and by him referred to the Department of the Interior, provides that when a mining claim on a lode has its inception prior to the location of a town site, and the mining claimant possessed and maintains the right of possession in accordance with other mineral land laws, no reservation in the patent for such mining claims should be inserted in favor of the town claimant or occupant. This opinion has been adopted.

Orders have been received to commence work upon the Wancoba District series of mines, Inyo county, belonging to the Waucoba mining company, of New York, of which Col. Hewston, of the Selby reduction works, of San Francisco, is President.

A bill to abolish the whipping-post has been introduced in the Legislature of Virginia by a colored Senator.

Foundry Notes.

New Pumping Engine.

The single pumping engine for the Idaho mine, Grass Valley, now nearing completion at the Union Iron Works, in this city, and being built under the supervision of Edward Coleman, President of the company, possesses several new features, noticeable among which are its simplicity and compactness. It is a 20x48-inch engine, with a 10-inch crank shaft 14 ft. long. The fly-wheel is 18 ft. in diameter. The pinion on the crank shaft is 34 inches in diameter, and is made with V teeth for strength and noiselessness. This pinion gears into the pump gear, which is 167 inches in diameter, 4½ pitch.

The gear shaft is 15 inches in diameter, and tapers to 11 inches, being 14 ft. long. The pitman rod is connected to the pump gear by a pin 7 inches long.

Instead of using the usual eccentric rods and rocker arms, a new design places a gear on the engine shaft, and runs a shaft geared to this, back lengthwise the engine, on which the eccentrics are placed, giving the motion to the valve and cut-off gear. This dispenses with large eccentrics and gets rid of a lot of rods and rocker arms.

On this engine is a plan of adjusting and regulating the bearing brasses by the use of horizontally inclined wedges and faces, with suitable actuating screws, all operating independently of the cap, which may thus be removed without disturbing the brasses or set of the shaft. In this device the side brasses have flanges projecting at right angles from the ends, so as to fit the sides of the pillow-block, and thus hold the brasses in place. The backs of the brasses are formed in with an incline face, extending from end to end of the brass between the flanges.

Wedges are fitted into the spaces behind the brasses, lying horizontally, and having holes formed in their ends with screw-threads to receive the horizontal screws, which, when turned, will cause the wedges to advance or recede. The shanks of the screws have collars which fit in spaces between the flanges of the brasses and a projection, so that, when turned, the screw will not advance or recede, but will move the wedge. Another method of doing this is, instead of forming screw-threads in the ends of the wedges, as above described, recesses may be made to receive nuts, which will operate in the same manner. These wedges may be made of considerable length, on account of the width of the box, and they will thus support the brass for so great a distance that it will be very rigid and will not twist or get out of place. The space for adjustment is much longer, and, finally, as the adjusting screws pass in through the sides and are independent of the cap, the latter may be removed for inspection or other purposes without touching these screws or in any way disturbing the position of the brasses or the set of the shaft, which might otherwise get out of place.

O'Neill's cut-off and valve motion and Mr. Scott's patent governor and pilow-block adjustment are used on this engine. This governor is arranged so as to be easily adjusted for the work the engine is to do.

This is an excellently designed pumping gear; everything is carefully figured out and executed. It will greatly add to the facilities of the mine.

The total number of tons of ore and tailings worked in Nevada for the twelve months commencing October 1, 1880, and ending September 30, 1881, was 452,728 and 1,667 pounds; gross yield, $9,505,971.41.

The Modoc furnaces at Lookout, Inyo county, are in active operation, under the management of Superintendent Thomas, putting out bullion worth from $600 to $700 per ton.

Four million one hundred and fifty thousand dollars has been expended this year in buildings in Denver, Colorado.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

The Debris Question.

The Supreme Court Ruling against the "Act to Promote Drainage"—Perhaps Entitled to Appeal.

EDITORS PRESS:—The ruling in Septembsr lsst (see your issue of Oct. 1st) of the Supresne Conrt against the act of April 23, 1880, to promote drainage, which had been endorsed by the Sacramento Snpsrior Court April 29, 1881, with all due deferencs, seems to have struck debatabls ground in sffirming that "it contravenes Section 24 of Article 4 of the Constitution, which requires that every act shall embrace hut ons subjsct, which shall be expressed in the title.' Such an objection, if deserved, would not only reflect npon ths wisdom and intelligence of ths lats Legislature, which includsd many able lswyers, hut also upon the intelligencs of the Govsrnor and the Attorney-General at his alhow to advise him that he could sign such a hill. It ssems impossibls that either of them could have committed such a glaring oversight as the Supreme Court makes them chargable with; and as such ruling tends to lessan the public respect for the legislative branches of the State with thoss who simply look at resnlts, and such conclusions may perhaps be altogether unwarrantable, some rectification and redress seems called for, in visw, also, of ths direct wishes and intendment of ths people through their representatives, having heen thus set at nanght. But the question occurs whether the Supreme Court did not, in common parlancs, "discover a mare's nest," and that ths Govsrnor made no oversight in not vetoing the hill instead of approving it? Had he vetoed it, he would havs stated his reasons therefor; but having on the contrary approved it, and the Supresne Court raised an unexpected and perhaps unwarrantable issus, it seems logical if the Governor, as ths executive of the people, could have an opportunity of presenting the whole matter to the Supreme Court of the United States, or snch authority as can take cognizancs of ths Supreme Court of the State exceeding its anthority, if in fact they havs done so, however unwittingly. It was self-evident to the people and their representatives, and should have been to the Supreme Court, that the drainage of the State of California, or of the Sscramento valley was a very comprehensivs matter, requiring the profoundsst thought and sciantific skill to plan the accomplishment thereof.

The necessity for that was acknowledged when the offics of the State Engineer was created by the State; and perhaps as far as possible, the most skillfnl examination was made by the Stats Engineer and his assistants, in conjunction, also, with Col. Mendell, and more recently Capt. Eads. It then hecams necessary to put in effect, at kast so much as the Legislature would grant permission for, ths requisits dsigns or plans of ths Enginser.

The bill of 1880 was drawn for that purposs. We had also gained the experience of the examination and conclusions of ths Sacramento Rivsr Drainage Commissioners, in communication with Col. Mendell, that a mere canal through Yolo and the Montezuma hills would not give the relief required. It was patent, thersfore, that the drainage of the Sacramsnto valley was a very hig thing, and "to promots it" had a very comprehsnsive meaning. Ths alrsady published reports of the Stats Engineer strennously advocated dams in the upper affluents of the Sacramento river, so that, probahly, 70% of flood and mining debris could he held back in the canyons, and so enahle ths semi-filtered water the bsttsr to scour the lower channels and ths bed of the Sacramento river. "An act to promote drainage," therefore, fully implied to ths Lsgislature and the people and the Govsrnor, such works as tended to its successful prosecution, just as much as an act to provids a railway, would comprise all requisite etations, bridges and other necessary works to that end. But the Supreme Court unfortunately seems to have failed to understand the magnitude of the operations necessary to promote drainage in the Sacramento valley, and consequently see no connection between drainage and the storage of debrie and general improvement of the river channels, etc., which they are pleased to term "a combination of subjects," "drainage being suhordinate;" and yet if they had thought for a moment upon the analogy of the curriculum of education, fiom A, B, C, or the acquisition of science or numeration to algebra, the primary fingering a musical instrument, the drudgery of the scales and exercicss, and necessary relation between mechanism and genius as regards music and composition, the laws of perspective and the finished work of art, and all the steps in chemistry or geology, hut especially the requisite acquirements of a civil engineer, all subordinated to the proper grasp of the project, then they might have understood that while the project was to promote drainage, dams were subordinate thereto, and must he disciplined into subjection as much as a recruit through the goose step. While the Supreme Court admits, as a matter of oourse, that "the drainage of a State ie a public purpose in which the pnhlic may he interested," yet they remark that "the storage of debris is in its nature a private matter in which ths few are only interested." Evidently they had no concsption of what State drainage may involve, or they could not havs drawn such a distinction. Thsn, regarding the dams as a nrivate enterpriss, they deny the power of the Lsgislaturs to imposs taxes to further it. But the gravensss of ths charge hreaks down entirely if the dams wers for a puhlic purposs, and the private bsnefit is only incidental, whils the public bsnefit was as hroad as the district, or the ssveral districts designed for the Stats. But ths piunacle of absurdity is reached when they quote a fundamental law of the Constitution which has no sort of application in ths prsmises. "Taxation is a mode of raising revenue for public purposes. Whsn it is prostituted to objects in no way connected with the public intersst or wslfare, it ceases to he taxation and hecomes plunder." Of courss the inference they intended to draw by that is as clesr as it is nnwarrantahle. That the dams designsd by the State Engineer for ths public henefit, is in fact a private enterpriss for ths benefit of certsin parties, and therefors a tax for such purposs becomes plunder. The implied accusation is so outrageous and insulting, even to the Governor himself, who was made President of the Drainage Commissioners hy ths act, that it is astonishing that he has not rspudiated it in strong terms.

Further on, we ars told that "ths title does not express the objects or legislation smbodied in the provisions of the act;" but if ths title in the full acceptation embraces them, then it cannot be in conflict; yet on this narrow visw they, forsooth, declare that "the title is narrower than the hody of the act," and that "to prohibit such legislation was the sole end and aim of ths constitutional requirements." That would be iudeed a perverted view of the Constitution which csnnot understand "what there is in a name." The name is particularly significant, comprehsnsivs and concise, and for that reason highly creditable to the author of ths bill.

Justice Sharpstein's dissent and accordance with the court bslow in favor of letting contracts under the hill, will psrhaps yet prevail, for the Supreme Court laid down a rule which they acknowledged should guide thsm, but will admit of a very diffsrent construction than they adopted. They remark that "in considering such a question as overruling the Legislature, it is a csrdinal rule that nothing hut a clear violation of the Constitution will justify a court. Every statuts is presumed to hs constitutional, and every intendment is in favor of its validity. When a statnte is challenged, as in conflict with the fnndamental law, a clear and substantial conflict must hs found to exist to justify its condemnation." If none of ths objections of the Snprems Court are entitled to hold, and especially not in regard to conflict with title, thers is thsn neither a clear violation nor substantial conflict with the Constitution in the case, and the ruling ought to he reversed by soms still highsr tribunal, for, again, we may remark that the Suprsme Court failed to consider ths msrits of the cass, or ths complaint that was raised in ths Sacramento Court, April 29, 1881, which that court ovsrruled in favor of defendants. The plaintiff's complaint is that "the letting of contracts and expenditure of money will cause irreparable injury to the residents and taxpayers within the proposed drainage district," the tax being only 1-20 of 1% or 50 cents on each $1,000 property! No attempt was made to prove the irreparable damage that would accrus to plaintiff hy contrihuting 50 cents for their own protection, and in fact, it was too egregiously absurd for the Sacramento Court to entertsin, and moreover the people (the plaintiffs) had asked for that protection and that tax through the Legislaturs that gave them the hill. What presumption then for a few persons calling themselves *the people* to have gone into court and ask it to upsst the will of the Lsgislaturs and Executive!

Justice Sharpstein had no douht of the validity of contracts under the law, although he was not so snre of the legality of the mode of levying the tax, hut if there was a technical difficulty of that kind, it could have been amended in a subsequent Legislatnre; and still, if the people who had got the hill passed, kept faith with themselves, they would have paid the tax cheerfully and enjoyed the ehare of protection it afforded. However desirable it may he now, perhaps, that Congress will take the whole matter in hand, it might have been still bstter if the Governor had proceeded to let contracts according to Judge Sharpstein'e ruling, and the real gravity of the situation, which requires energetic measurss to prosecute the works shown to be necessary by the State Engineer to improve the rivers and afford protection for the Sacramento valley lands. The old adage, "delays are dangerous," was never more pointed thau at present. A SACRAMENTAN.

J. MCNALLY, the new Superintsndent of the Day Co., informed the Pioche *Record* that the company's furnace wonld not resume operations again this winter. This is positive. The work at the mines will be pushed vigoronsly and they will he placed in a condition so ore can he extracted and hoisted at less expense than at present. The mines will be thoroughly prospected, and if the ore body warrants it then new furnaces will he erectsd.

TOMBSTONE *Epitaph:* The Banner mine, the shaft of which is on Allen street, adjoining the county hospital, has been bonded for $100,000 for 30 days. The bond was taken, it was said, for prominent San Francisco mining men.

Building Dams.

The hydraulic miners of the northern portion of Sierra county, havs purchased sevsral miles of the bsd of Slats creek, at great expense, and have huilt dams thersin to restrain the flow of debris toward ths valley, for which thsy dssrve great credit. Among those connected with this project ars Morgan & Donahoe, of St. Lonis, Kingdom Bros., of Poverty Hill, Gso. Cox, of Pins Grove, and prohahly the owners of hydraulic mines at Gibsonville. The initial dam is located abont three miles above a point where the road from Scalss diggings to Strawbsrry valley cross Slats creek. A snbstantial dam hetween 20 and 30 ft high, has been srected at a very favorable point for the purpose intendsd, and it is estimated by those who have ssen the work, that it will hs years bsfore any of the heavier detritus will get over it. When the large hasins ahove the structurs become filled, the work will be added and a still lsrger arsa of depositing ground will be affordad. As a matter of fact, very little, if any, of ths sand put into the trihutsries of Slate cresk, has yet reached the Yuba. From the point where ths hsaviest work has besn dons, to the north Yuba river, the distance is ahout 30 miles, and the grade of the creek is so light that all the coarser tailings have bsnked up along its hsd, heing in placss 50 ft deep. Without the dams years would elapss bsfors anything but the very lightsst of the dsbris would reach the valley from this source. The miners in the Slats cresk basin, realize, however, that the time may come whsn thsrs will bs danger of their debris getting into the rivsr, and havs taken this action to prevent, as far as they can, any damags from the working of thsir minss. The particles of soil hsld in suspension by the water as a matter of course go down with the flood. But this lighter or alluvial soil is one of the best fertilizsrs known, and doss no damage other than to fill up the river bed and muddy the water. In this whole hasin thsre is very littls pipe clay, which is the particular slicken that cracks open upon drying and damagss agricultnral land when deposited upon it.

The miners at Scales, Boycs Bros. and others, have also huilt dams in Rock cresk, a tributary of Slate creek, and are preparsd to taks cars of their tailings. They havs also first-class facilities for doing this, aud nnless the conrts dscide that the miner cannot muddy the water, which is not probahle, all the minsrs on the north sids ars prepared to continue work indefinitely, without damage to any one.—*Mountain Messenger.*

Dosoris.

Ths Dosoris camp, about 14 miles south of Prescott, is one of the most promising camps in northsrn Arizona, and one which will, ers long, he turning out considerahls bullion. The hirst claim was found in this camp about six months ago, and since thsn many other flattering prospects have heen discovsrsd. Since the location of the Dosoris, the first in the camp, a forcs of men havs been steadily smployed developing the mine and takiog out ors. Thsy have a tunnsl in on ths ledge about 40 ft. and ars at present sinking a shaft, which is down 60 ft. It is their intention to start a tunnsl soon at the hase of the hill which will tap the ledgs at a considerahls depth. Ths lsdge is 5 ft. in thicknsss, with good, solid walls on both sides, and in soms places the ore body is the full width of the ledge. The ore is very high grads and shows metallic silver in considsrahls quantities.

The Buzzard and Rsven, two othsr claims, are showing fine ore. Anothsr claim in this district well worthy of mention is the Blue Dick. A quarter interest in this claim was sold thres wesks ago for $1,000. They are at present running a crosscut tunnsl to tap the ledge. The ore is similar in charactsr to ths Dosoris. The Mark Twain and North Star, two north extensions on the Blue Dick, show similar cropping to that found on the original claim. No work as yst has hsen done on sither of thsm. The camp can boast of a saloon, a good boarding-honse, plsasant quarters for the superintendent and almost a dozen tents. Taking into consideration the high grade quality of the ore, and the ahundance of material to work smelting ores, the camp certainly has a hrilliant future in etore for it.—*Arizona Miner.*

A PECULIAR SENSATION.—James Rowe, the man who was blown up at the Forman ehaft and lost hoth of his arms and his eyesight, is still hlown np nightly in imagination. He yeeterday told Dr. Webber that he felt that he was getting a good deal bettsr. Said he: "Now I am only obliged to die once per night, whereas a few daye ago I had to he killed twice or three times nightly." What he meant was that nightly it appeared to him that the explosion again occurred, and that he was knocked senseless by the flying fragments of rock. The Doctor says this is a thing that givee a great deal of trouble to all patiente who have heen hurt hy caves or explosions. It often prevents them from eleepiag. No sooner do they hegin to doze than the cave comes or the explosion occurs, aud they awake with a start and cry out.—*Virginia Enterprise.*

A LARGE number of the idle men out in Brietol district are now devoting their attention to prospecting. This is a hig improvement in the way of "killing" time than to he loafing around ealoons drinking, and ewindling the saloonkeepers out of their poor liquor.

The Debris Dam Below La Porte.

The dam recently built in Slate cresk, below La Porte, has been completed, and is a vsry substantial structurs. Soms ons in that sscton, evidently well posted, gives the Marysvills *Express* ths following dsscription of it: "The works are built to corral the debris from the mines of La Porte, Port Wine, Gibsonville, Poverty Hill, Howland Flat, St. Louis and Gardner's Point. These companies havs purchased sevsral milss of the Slats cresk bedrock, running up strsam from the dam. The grade of this stretch of bed-rock is vsry light, and the capacity for the storage of debris is unlimited. The construction of ths dam was under ths supervision of U. S. Deisem, forsman of ths Sears Union Watsr Co., and was completed lsst week. It is located ahout three miles below the Amsrican houss, and is built in ths main of timher and rock. Its dimsnsions ars 80 ft. long and 17½ ft. high. Ths foundation is upon solid bed-rock, and the wings are secured firmly in the rocky sidss of the canyon. A crib of heavy timher filled with large boulders forms ths center, and from this bulwark to either side of ths canyon and into the rock extends ths horizontal timhers. These are stayed by tiss 40 ft. in length sxtending up stream. The sizs of the upright timbers is from 15 to 20 inches, dove-tailed and pinned from top to hottom. The cross timhers are from 30 to 36 inches in diamster. The work hss heen complstsd at considerahls outlay of cspital and nndsr very trying circumstances, owing to the late storms and freshets. But the builders had ths advantags of an unlimited quantity of timhsr from which to draw, on ths canyon sides above ths works, and an abundanco of rock on the site of the dam. Ths late freshet, although quite extensive, had no effsct whatsvsr on the yst unfinished condition of ths dam. This work will hs raissd from time to time as ths filling of the ressrvoir above goes on, although ths present cspacity is thought sufficient for two or three years. The capacity of the canyon for the storage of dsbris is from 1,000 to 1,500 ft. wide, by 500 ft. in depth."

The Men in the Mines.

Ths Chicago *Mining Review* has ths following to say of the msn in ths mountains and the mines versus the men iu the stock hoards:

"There appears to bs a fesling on the part of a certain class of journals which livo in the atmosphers of ths stock hoards, that when a break comes and the stock exchangss are dull and dessrted, that the foundations of mining are thrsatened, and that the strong hands in mountain fastness and dssert plain wisiding pick and drill ars paralyzed by the wild speculations of ons party or the other in financial csnters where the exchanges exist.

"Mining for prscious and useful metals throughout the length aud hresdth of the land is nnconscious of ths mimic pandemonium which is daily witnessed, whsre it would seem that the mines were heing tossed to and fro like fallen leaves in thsantumn wind. Ths thundsring crash of ths stamp mill in the land, liks the ponderous footstsps of a giant crushing mountains heneath his mighty feet, and the stsady stream of hullion, like a molten river of treasure, flowing from ths smelter, and the flumes from Mains to California, drowns the tiny conflicts of the exchanges, as the rolling thnnder and the hurricane of the tsmpest hush the twittsr of a sparrow. Thsy have hut a faint conception of the grandeur aud magnitude even of ths mining industry of ths present, which is only the seed time and the harvest, compars with what it will bs in the futurs, who fear that a few broksrs, in any or every city, by shouting the price of stock, with the names of mines attached, can wake, ths eternal slumber of the monntains rsaching to hesvsn, and change one particle of the treasnre they hold in rocky vaults in their hosoms, waiting to he unlocked and given up to the dsmand of a world's industries."

IRON SHIPBUILDING.—Iron shipbuilding will hs further extended in the north of England in the beginning of next year. Two new firme will commence huilding on the Wear; one is a company—the North of England Shipbuilding Co.—and the other ie a private partnerehip. Two large huilding yarde have been opsned ou the Tyne this year, one hy the removal of an existing firm to largely extended premises, and the other hy a Glasgow firm. Extensive new marine engine worke have also been opened, and other works are in course of construction at Wallsend-on-the-Tyne. The manufacture of steel boilere for steamere is a growing branch of industry. Workmen are very fully employed in all branches of trade connected with iron shiphuilding. Several marine engine factoriee have heen working night and day ehifte over the past two months, and new firms are using the electric light shifts with great enccess in working out the night shifts.—*Iron.*

THE hydraulic mining companies of La Porte, Port Wine Gibeonville, Poverty Hill, Howland Flat, St. Louis and Gardiner's Point, Sierra county, having purchased several miles of the hed of State creek for a dump, have constructed a strong dam across tbe creek in which to impound the debris from all the minee in these localities. The dam will be raised from time to time ae required, and the canyon in which it is sitnated has a storage capacity of from 1,000 ft. to 1,500 ft. in width and 500 ft. in depth.

Mechanical Progress.

How to Melt Babbit Metal.

I wish to say a few words in reference to the treatment of Babbit and other similar anti-friction metals. Workmen who are unaccustomed to mixing or treating metals while in liquid state, will generally melt such metal upon a blacksmith's forge, by applying heat so rapidly that the ladle will become red hot before the metal within it begins to melt. When it has melted a dross rises to the surface and is skimmed off by the workmen and thrown away. This skimming process is kept up as long as the ladle is kept on the fire. Now such a course is all wrong, because, by applying heat too suddenly, the metals which fuse at lower degrees of heat sweat out, and are burned before those which melt at higher temperatures become fluid.

The dross, as it is commonly called, which rises to the surface, is in many cases the antimony or hardening property of the alloy, and should not be thrown away. The surface of the melted metal should be kept covered with fine charcoal, which will prevent oxidation. A small lump of sal-ammoniac should also be kept upon the surface of the metal. The metal should always be stirred before pouring, otherwise the heaviest metals will separate and sink to the bottom of the ladle, and a constantly varying quality of metal will be the result.

By melting the metal slowly and keeping it properly fluxed as described, it will run sharp, each casting will be found uniform throughout, and the metal be of equal hardness. In observing these simple precautions, much of the dissatisfaction now experienced in using Babbit and other anti-friction metals will disappear, and the metal not be condemned because it simply obeys the laws of nature and separates when improperly treated.—*L. F. Lyne, in American Machinist.*

The Motor of the Future.—In the opinion of most of the scientists of Great Britain, electricity is to take the place of steam in driving machinery and moving cars, and is to be generated by the action of tides, winds and falling water. They predict that wind power will be utilized to a greater extent than any persons in a previous age ever believed it would. Wind will generate electricity for moving machinery, for lighting streets, and warming dwellings in Ireland, Belgium, Denmark and other countries where there are few streams that afford water power. The movement of tides will produce the same effects in most countries that have an extensive sea coast, while the fall of water in rivers and streams will generate electricity in all mountain regions. The great electrical exhibition at Paris did much to draw attention to what is called the motor power of the future. A picture called "The Queen of the Nineteenth Century" hangs in many of the shop windows. It is a female figure surrounded with a halo, and emitting rays of light from the hands, which are raised as if to enable the being to fly. The light gives the arms the appearance of wings. The artist is an enthusiast, and is regarded by many as a prophet. We all hope that his fair predictions will be realized. The steam engine is a good thing, but we are ready for something better. It has done so well that till recently scientific men and inventors have not troubled themselves to make something better.

Malleable Iron.—M. Forquignon has published an extensive series of researches upon malleable iron and the re-heating of steel, and among other conclusions he attaches special importance to the following: 1. Malleable iron always contains amorphous graphite. 2. A casting may lose carbon and yet remain brittle if the original quantity of graphite is not increased. 3. A casting may become malleable without losing any sensible portion of its carbon. 4. If silicium is added to manganesian castings they are improved by reheating. 5. Hydrogen and nitrogen may unite with the carbon of a casting so as to make it malleable without the production of graphite. 6. The breaking load is always more than doubled, sometimes more than quadrupled, by annealing. It increases with the duration of the heating, very rapidly at first and then very slowly. 7. Ductility generally increases with the resistance to breaking, but after a certain limit it has a slight tendency to diminish.

The Tensile Strength of Glass.—Traulionie gives the tensile strength of glass at from 2,500 to 9,000 lbs. per square inch, according to kind; crushing strength 6,000 to 10,000 lbs. per square inch; transversely, by his own trials, Millville (N. J.) flooring glass, one inch square, and one ft. between the end supports, breaks under a certain load of about 170 lbs., consequently it is considerably stronger than granite, except as regards crushing, in which the two are about equal. It is suggested that glass will shortly be used for many purposes where other and much inferior materials are exclusively employed. Glass may be used as water conduits to better advantage than cast iron or terra cotta, as it is impervious to moisture and proof against corrosion or chemical action. It is already considerably in use for flooring, and it has lately been successfully experimented with for railway sleepers under exceptionally severe conditions.

Cost of the Storage of Power.

In regard to the comparative cost of the storage of power by electricity and compressed air, Col. Beaumont writes thus to the London *Times:* "Attention having lately been directed through your columns to the storage of power by means of air and electricity, and it appearing from the speeches of the chairmen of certain railway and tramway companies that misapprehension exists with regard to the cost of air, I beg leave to state that air is now being compressed to 1,000 lbs. on the square inch with far less cost and difficulty than has hitherto been accomplished with steam at high pressures. Independent proof of this will shortly be forthcoming from a body of well-known scientific gentlemen who have investigated and tested the matter for themselves.

"For locomotive purposes, the results obtained from the storing of electricity do not approach those obtained from the storage of air in the amount of force actually available for traction or propulsion. For tramways there is no doubt of the cost of air being considerably below steam, and air engines could be used on the Underground railway at a cost in capital expenditure somewhat in excess of that for steam engines, but in daily working the expenses would be very trifling, if any, beyond the present cost of steam, while it is obvious that the difficulties of ventilation and deterioration of girders would vanish."

New Material for Metallic Ships.—A London company has recently built, by way of experiment, a small steam yacht of phosphor-bronze. The vessel is built entirely of that material. Her length is only 35 ft., her beam about 6 ft., and she attained a speed of 12½ miles per hour, which, considering her size, is a creditable performance. The chief object of the company in having so small a craft built was to test the rigidity of the phosphor-bronze sheet and angle pieces used in her construction, prior to having boats built on a large scale. The results of the trial trip have been beyond the company's expectation as regards rigidity and absence of vibration. As the cost of phosphor-bronze boats will not much exceed that of steel boats, and as the metal is not subject to corrosion like iron or steel, and also retains its value, the use of the material in the construction of steam launches, torpedo boats, etc., is probable.

A Filler for Porous Hard Wood.—Among the many fillers in use for porous hard wood, this is recommended as one of the best: Stir boiled oil and corn starch into a very thick paste, add a little japan and reduce with turpentine, but add no color for light ash. For dark ash and chestnut use a little raw sienna; for walnut, burnt umber and a slight amount of Venetian red; for bay wood, burnt sienna. In no case use more color than is required to overcome the white appearance of the starch, unless it is wished to stain the wood. The filler is worked with brush and rags, in the usual manner. Let it dry 48 hours, or until it is in condition to rub down with No. 0 sand paper, without much gumming up, and if an extra fine finish is desired, fill again with the same materials, using less oil, but more of japan and turpentine.

To Prevent Wood from Shrinking.—Carefully conducted experiments have shown that wood, well saturated with oil, when put together, will not shrink in the driest weather. Wheels have been known to run for many years, even to wearing out the tires. Very many dollars might be saved annually if this practice was adopted. Boiled linseed oil is the best for general use, although it is now known that crude petroleum, on even old wheels, is of great benefit.

Life of Steel Rails.—An engineer of the Rhenish railway, which has had the longest experience in steel rails, has made a calculation according to which the average duration of steel rails, when 24 trains pass over them every day, is 30 years, while that of iron rails, with a traffic of 17 trains, is 11 years. Steel rails, according to this calculation, last four times as long as iron rails, although they are but one-third more expensive.

The Economy of Steel Ships.—The English *Nautical Magazine* thinks that steel ships pay. A steel ship was built in 1877 for the Bilbao ore trade at a cost of $91,750, or $7,750 more than she might have been obtained for if built of iron. The earnings of this vessel, due to increased carrying capacity, have amounted to $2,800 per annum, a yearly gain, which is a very fair percentage upon $7,750.

Progress of Bessemer Steel Manufacture.—Four new Bessemer steel plants will be in operation during the year—one in Colorado, one at Scranton, Pa., one near Pittsburg, and the South Chicago works. Besides this the old plants are materially increasing their capacity by introducing larger converters, and several mills are putting in rail trains to roll foreign blooms.

Burning Over Soil.—M. Fleischer has made a comparison between the barks of young oaks grown respectively upon sandy loams, upon peaty soils that had been once burned, and upon a similar soil that had been thrice burned, and found the proportion of tannin highest in the product of peaty soils,

Scientific Progress.

The Materials of Paleontology.

Although paleontology is a comparatively youthful scientific specialty, the mass of materials with which it has to deal is already prodigious. In the last 50 years the number of known fossil remains of invertebrated animals has been trebled or quadrupled. The work of interpretation of vertebrate fossils, the foundations of which were so solidly laid by Cuvier, was carried on with wonderful vigor and success by Agassiz in Switzerland, by Von Meyer in Germany, and last, but not least, by Owen in this country, while, in later years, a multitude of workers have labored in the same field. In many groups of the animal kingdom the number of fossil forms already known is as great as that of the existing species. In some cases it is much greater; and there are entire orders of animals of the existence of which we should know nothing except for the evidence afforded by fossil remains. With all this it may be safely assumed that, at the present moment, we are not acquainted with a tithe of the fossils which will sooner or later be discovered. If we may judge by the profusion yielded within the last few years by the Tertiary formations of North America, there seems to be no limit to the multitude of mammalian remains to be expected from that continent, and analogy leads us to expect similiar riches in Eastern Asia whenever the Tertiary formations of that region are as carefully explored. Again, we have as yet almost everything to learn respecting the terrestrial population of the Mesozoic epoch—and it seems as if the Western Territories of the United States were about to prove as instructive in regard to this point as they have in respect of Tertiary life. My friend Prof. Marsh informs me that, within two years, remains of more than 160 distinct individuals of mammals, belonging to 20 species and nine genera, have been found in a space not larger than the floor of a good-sized room; while beds of the same age have yielded 300 reptiles, varying in size from a length of 60 or 80 ft. to the dimensions of a rabbit.

The task which I have set myself to-night is to endeavor to lay before you, as briefly as possible, a sketch of the successive steps by which our present knowledge of the facts of paleontology and of those conclusions from them which are indisputable has been attained; and I beg leave to remind you at the outset that, in attempting to sketch the progress of a branch of knowledge to which innumerable labors have contributed, my business is rather with generalizations than with details. It is my object to mark the epochs of paleontology, not to recount all the events of its history.—*Prof. T. H. Huxley, in Popular Science Monthly.*

Decomposition of Steam.—At a recent meeting of the American Academy of Sciences, an apparatus illustrating the decomposition theory of steam boiler explosions was shown at work, proving, according to the inventor, that steam might be decomposed by simple heat into the constituent gases of water—oxygen and hydrogen. The experiments conducted were interesting, but perhaps not conclusive as showing a possible cause of boiler explosions. The apparatus was very simple—a flask in which water was heated, a tube conveying the steam into a closed platinum crucible, where it was again heated by a spirit lamp, and a tube thence carrying the superheated steam and the liberated gases to an ordinary pneumatic trough, where the mixed gases were collected in a test tube, while the steam was absorbed. At the conclusion of the experiment, the gases thus collected were exploded by a lighted match, showing that they were the components of water. The experiment indicates that this explosive mixture of gases may be formed in a steam boiler, but it is scarcely probable they ever would be. The boiler must, at least in part, be raised to a full red heat. Then cold water must be injected, for so long as steam and the gases are mixed, the latter cannot explode. The injection of water must condense the steam in the boiler before it cools the red-hot iron. All these very probable conditions being fulfilled, an explosion of the gases may take place.

Separation of Aluminum from Iron.—The neutral or slightly acid solution is treated with hyposulphite of sodium until all ferric compound have been reduced. A solution of cyanide of potassium having twice the volume of the iron-aluminum solution, and containing from 15 to 20 grams of cyanide of potassium, is heated to boiling, and the iron-aluminum solution slowly poured into it. The solution is then quickly cooled, acidified with acetic acid, and the aluminum precipitated with carbonate of ammonium. If the aluminum hydroxide has not a pure white color, it must be dissolved and reprecipitated. The separation is quantitative.

Liquid Carbonic Acid.—The chemical works of De Haen, in List, near Hanover, have for some time past been engaged in the manufacture and sale of liquid carbonic acid. The liquid is compressed in cylinders having a capacity of about 10 litres, which are tested to a pressure of 100 atmospheres. Should the railway companies decide to carry these cylinders, it is expected that the liquid acid will soon come into general use in the soda water trade.

Effects of Atmospheric Electricity on the Telephone.

Of late several European observers appear to have been studying the effects of certain meteorological phenomena on the telephone, the latter being connected with a wire stretched, for instance, between the roofs of two houses, and in connection with the water or gas pipes. On the occurrence of lightning, more especially, sounds are heard, and at the same instant (according to M. Rene Thury, of Geneva) as the flash is seen, whatever the distance of the latter. Even when no thunder was heard, and the discharge must have been at least 35 km. off, M. Thury observed those induction effects. He says the sound is like that of a Swedish match rubbed on the box. The telephone affords an easy method of studying the velocity of transmission and other features of this electrical influence. M. Lalagade, who has experimented similarly for some time past, thought to amplify the sounds, and did so by placing two microphones on the plate of the receiving telephone. The arrangement is set up in a quiet room, where all foreign vibrations are guarded against, and the author is able to hear the least sound at a distance of one meter or more from the second telephone.

Again, M. Landerer, at Tortosa, finds currents produced in his telephone-circuit by atmospheric electricity in three different ways. First, the condensation of aqueous vapor results in a sound recalling the cry of tin. A sensitive galvanometer in the circuit is not, or hardly, affected. These sounds are strongest at night. Next, there are the sounds which occur during lightning (and the currents producing which affect a galvanometer considerably). Thirdly, the wind generates currents which do not act on the telephone, but act on the galvanometer strongly. At Tortosa, the very dry west winds produce the greatest oscillations. Telluric or earth currents act both on the galvanometer and on the telephone; they are distinguished from atmospheric currents by the regularity and continuity of their action during pretty long intervals.

Engraving by Electricity.—M. Plante has succeeded in engraving on glass by means of electricity. The process is as follows: The glass is laid in a horizontal position, and covered with a concentrated solution of nitrate of potash, the liquid being retained by a shallow vessel in which the glass is placed. A platinum wire is dipped in a horizontal position in the solution along the edges of the glass. The wire is attached to one of the poles of a secondary battery of 50 or 60 elements. The lines are traced by hand with the point of an insulated platinum wire connected with the other pole of the battery. The parts of the glass covered with the alkaline solution become engraved when touched with the end of the platinum wire, however rapidly this is moved, the thickness of the lines varying with the thickness of the wire. The current from either pole may be used in the writing wire.

Solid Petroleum.—According to a St. Petersburg paper, a German, Herr P. N. Wetmer, has practically solved the problem of rendering petroleum solid—a problem considerably studied by chemists of late, in view of the large question of transport. A company has been formed in Russia to work the patent when completed. The mode of treatment is not yet disclosed, and chemists to whom small samples of the solid petroleum have been sent have not been able to make out the nature of the foreign substances that are added in a proportion of 2, or at most 3%., to solidify the petroleum.

Influence of Light on Germination.—Herr Stehler's researches do not confirm the theory that light hinders germination of seeds generally. He admits the probability, however, that light may not be advantageous in the case of seeds that germinate quickly and easily, such as clover, beans or peas. He says that the germination of certain seeds, especially those of the grasses, will not take place at all, or with great difficulty, in darkness.

Cloud Indications.—When the whole sky is covered with clouds, their further formation and increase in bulk and density is indicated by their descent to a lower level, and their decrease by their ascent. Accordingly, when clouds begin to sit down upon the tops of the hills, it prognosticates rain, and when they begin to rise above the hills, it prognosticates dry weather.

Plant Growth.—When the earth in which a plant grows is much warmer than the air, the plant grows very thick, ceases almost altogether to increase in hight, and finally shows deep, transverse rifts which make farther growth an impossibility. These effects were produced by M. Prillieux who used a large dish of earth, in which he planted the seeds, and kept the earth 10° warmer than the moist air of the room.

Progress of the Telegraph in China.—The Chinese seem to have given up their stupid opposition to the telegraph, and this important factor in modern progress is now making fair advance in that country. In 1871 the length of wires in use amounted to 3,929 miles, while in 1880, 9,345 miles were in operation.

It is estimated that the bullion output of Arizona for 1881 will reach $18,000,000.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Ophir, Dec. 31st, $18,541; Hananer, 30th, $2,150; Horn Silver, 30th, $30,000; Hananer, 28th, $4,250; Horn Silver, 28th, $27,500; Bullionville, 28th, $2,042; Barbee & Walker, 28th, $31,576; Barbee & Walker, Jan., $2,012; Hanauer, 1st, $2,150; Germania, 1st, $2,400; Leonore, 1st, $500; Ontario, 1st, $8,900; Horn Silver, Dec. 31st, $55,000; Stormont, 30th, $7,460; Hanauer, 30th, $2,090; Horn Silver, 29th, $17,500; Barbee & Walker, 30th, $91,970; Steward, 30th, $7,500; Northern Belle, 28th, $15,500; Winnemucca, 30th, $1,200; Star, 23d, $4,505; Standard, 26th, $43,776; Northern Belle, 26th, $4,208; Contention Con., 30th, $14,875; Northern Belle, 28th, $4,418; Star, 26th, $2,664; Northern Belle, 31st, $8,141; Contention, 30th, $15,734; Bodie, Jan. 3d, $6,695; Silver King, Dec. 28th, $20,315; Christy, 30th, $4,371; Manhattan, 30th, $11,028.13; Leeds, Jan. 3d, $1,795; Head Center, 30th, $4,080.28; Silver King, Dec. 31st, $28,400; Star, 30th, $3,301.54; Day, 30th, $5,500.

THE year 1882 began on Sunday and will end on Sunday.

MINING SHAREHOLDERS' DIRECTORY.

Compiled every Thursday from Advertisements in Mining and Scientific Press and other S. F. Journals

ASSESSMENTS—STOCKS ON THE LISTS OF THE BOARDS.

Distributing Risks in Fire Insurance.

The great fires of Portland, Chicago, Boston and St. Johns have caused a revolution in the system of fire insnrance in more senses than one, not insignificant of which is distribution of risks and division of lines.

This theory had its incipiency with the large nnderwriting corporations of the time, and was by them taught their agents, and by their agents tanght the insuring public with ever varying success, nntil the oft occurring conflagrations and consequent crippling of companies, with its attendant confusion and loss to the insured burned into the reason of property owners the absolnte necessity of small lines and many companies to be reasonably protected against large fires.

In the scramble for business single companies under exclnsive management have gone down under the weight of heavy linee closely huddled together in burned districts, and the policy holders have been left with hnt their premium receipts to console them, where the facilities for distributing the risks among several companies and a disposition to make nse of these facilities would not only have saved the company's life, hnt wonld have protected the interests of the policy holder, and possibly saved him from financial ruin.

Now, companies and property owners have almost universally wheeled into line on tbis question, admitting its importance and practicing its lessons, until it is difficnlt for the former to put ont or the latter obtain a policy of insnrance covering more than $10,000; wbereas, two decades ago, it was not an unusual thing to find individnal companies carrying from $50,000 to to $150,000 on a single risk.

To accomodate this demand of the insuring pnblic, the well known firm of Messrs. Hntchinson & Mann, of onr city, have gathered aronnd them a large list of staunch Fire Insnrance companies, which, during the past ten years have promptly and satisfactorily met and paid their large losses (reaching more than $2,000,000), entitling them to their justly merited position of one of the *First* amonng the nnderwriting fraternity of onr coast—the heartfelt thanks of hosts of victims of fire, and the respect of all our business and commercial circles.

An individnal or a corporation's success in any field or enterprise is nsually the measnre of capacity and energy; and in the peculiar profession of fire nnderwriting, these two elements are especially reqnisite to snccess. That Messrs. Hntchinson & Mann have been snccessfnl in estahlishing and controlling in its minntest detail their enormons bnsiness of $600,000 annnally is an nnqnestioned fact, attained through eternal vigilance and personal solicitation and application. They bave not, like the hen in the fable, sat still after requesting others to scratch for them; but they also have scratched early and late, and we point to them with pride as probably the largest in point of premium receipts of any insurance agency in the United States.

The Mining Share Market.

Many of the operations at the leading Comstock mines are at points favorable to developments. Yet the market is very inactive. The main north drift on the 2500-level of the Sierra Nevada and the several crossents at that point are passing through vein material, which gives low assays wherever streaks of quartz make their appearauce. Ahout the same may be said of the east drift on the 2900 level of the Ophir and Mexican and, indeed, of the several drifts on the 2700. The grond is of a fertile character, and metal is fonnd wherever qnartz makes its appearance. At the bonanza mines the arrangements for ventilation ars not yet completed, yet the circnlation of air is very good, and work goes on at all points very comfortably. As yet most of this work is preparatory instead of exploratory.

At the Yellow Jacket they are now at work in some interesting ground, and are finding ore giving low assays in several directions. They have above their 3000-level a vast extent of nnexplored conntry.

The San Francisco Board has passed a resolution, to take effect Jan. 1, 1882, that the names of all future candidates for membership shall be referred to a committee. If the committee reports favorably, it will require 20 black balls to exclude the candidate. If an nnfavorable report is made there will be no election.

The following mining companies have made statements of financial condition on December 31, 1881; cash on hand: Alta, $3,699.53; Alpha, $1,588; Andes, $6,127; Benton Consolidated, $12,984.18; Belcher, $22,888.54; Con. Virginia, $1,926.65; Crown Point, $13,096 89; Hale & Norcross, $75.58; Lady Washington, $2,186; Mexican, $25,260.32; Northern Belle, $59,042.50; Ophir, $42,100; Utah, $11,746.65. The following companies had an indebtedness on the above date: Best & Belcher, $20,328.05; California, $57,426.18; Gould & Cnrry, $14,897.66; Sierra Nevada, $28,171.77.

New Incorporations.

The follnwing company bas been incorporated and papers filed in the office of the Superior Court, Department No. 10, San Francisco:

ALASKA O. & S. MINING, MILLING AND TRADING CO.—Jan. 4. Location, Alaska Territory. Directors—A. F. Williams, F. J. McWorthy, J. A. Lytle, R. B. Ward, S. J. Marston, J. Lowerie, J. C. Green.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

ALPINE.

DITCH.—*Monitor-Argus*, Jan. 2: The ditch for the Alpine gravel claim is progressing nicely. The weather has been all that could be wished for such work.

AMADOR.

WILDMAN.—Amador *Ledger*, Dec. 31: It will be remembered that this Sutter creek quartz claim has been involved in litigation for years. A few months ago a new complication arose by James Morgan jumping the ground over both the other claimants. He has succeeded in holding possession ever since. We are now informed that the long-standing dispute is at last finally settled in favor of Mr. Morgan, whether by compromise or otherwise we bave not learned. Anyhow, he has secured undisputed control, and will start in to develop the mine in good style next spring.

DISCELLANEOUS.—Everything continues bustling at the Walton mine, between Jackson and Middle Bar. The erection of the mill is being pushed ahead, although it will require weeks yet to finish it. We do not hear of any developments of importance in the mine, nor whether there is ore enough in sight to justify the erection of the mill.

DRYTOWN.—Amador *Dispatch*, Dec. 31: The last clean-up at the Potosi mine overpaid running expenses only. The Seaton mill will be in running order by the middle of January, and the company bave a large amount of rock in the dump ready to crush. A large force of carpenters are still at work on the new Loyal mill.

CALAVERAS.

LAMPHEAR MINS.—Calaveras *Chronicle*, Dec. 31: The work of erecting machinery on the Lamphear mine is progressing as rapidly as can be done. Before a great while everything will be in readiness to commence operations. We are informed that the stock is now up to $5 a share, none being sold at a lower figure.

CHISPA.—On Thursday last, Green Lewis, a young man who is mining near Vallecito, picked up a piece of gold weighing over 8 ounces. The mine in which he is working is said to be exceedingly rich.

A CHEAP MINE.—The Mountain Slide mine located on Coyote flat, near Robinson's ferry, has been sold recently to Pietro Ragiadle, by Robert Douglas, for the small sum of $180, together with improvements, consisting of pump wheel, blacksmith shop, carpenter shop and other articles of value. This mine was owned in former years by Capt. Hanford, the builder of the great Salt Spring reservoir. The year previous to the purchase by R. Douglas, it was owned and worked by Bradberry, Smith & Paul, who in the short space of four months, took out of the mine between $8,000 and $9,000, while their expenses were not over $1,300. The party who purchased the mine is fully aware of its value, and would not sell for any small amount. The want of capital to work the mine properly, compelled Mr. Douglas to sell it.

EL DORADO.

QUARTZ MILL CONTRACTS.—*Mountain Democrat*, Dec. 31: D. C. Wickham, of this city, has taken a contract to put up a 20-stamp mill at the Kna mine, Cosumnes township. Our readers will remember that a few weeks ago we gave them a description of this, better known as the "Hite," or "sulphuret" mine, and predicted for it a brilliant future. We are creditably informed that since that time they have hauled to Drytown, Amador county, 90 tons of their unassorted vein matter, which by mill process yielded them an average of $80 per ton. This, and their late explorations, which have demonstrated that their vein or deposit is even more extensive than was anticipated, abundantly justifies them in immediately and as speedily as possible putting up a large mill. Mr. Wickham has also contracted to put up 10 additional stamps, and make other improvements of a substantial character, at the Gopher-Bowlder mine, Kelsey township.

MARIPOSA.

THE RED BANKS.—Mariposa *Gazette*, Dec. 31: The works at the Red Bank bydraulic claim, on the Merced river, which is under the management of Col. Swadley, is all ready for action, but unfortunately there is not sufficient water to prosecute the work beyond one or two hours a day.

MONO.

BODIE.—*Free Press*, Jan. 4: Those who reside in this district look confidently forward to the time when all the Bodie mines will resume operations; when ore in quantities will be found at depth; when their shares will advance in price and give the "boys" a chance to make a few dollars. As will be seen from a detailed account of work performed in several of our leading properties, the managers are hunting for the missing link, so to speak. The Standard is looking well, and some of the crossents which some time ago were in bad ground, are now in a favorable formation. There is ore enough in sight to pay dividends for 2 years, and in the meantime something in the way of a new development will no doubt be made; something that will give the camp a new lease of life. The Bodie Con., during the past week, struck a little ruby silver. This is something new, and it may be the outside sontinel of a zone of silver ore. Ore is still sinking its shaft. The Goodshaw is also sinking, and will soon commence to crosscut.

NEVADA.

SPENCEVILLE.—*Foothill Tidings*, Dec. 31: The lower part of Nevada county, or rather the western portion of Rough and Ready township, is getting again to be lively; something like it was in the early days of the fifties. Spenceville with its copper works, is flourishing like a green hay tree, so far as the town is concerned. The smoke and fumes from the works there, however, do not let any green trees of any kind flourish within reach of them. But there is lots of business going on at Spenceville, and therefore the folks there do not mind a little smoke and a few disagreeable fumes. At the Zinc House and Round Tent House there is a great deal of heavy work done in the way of prospecting for gold hearing quartz ledges. A San Francisco company is now running a tunnel in on the big mountain near the Zinc House, and has a good showing. The ledge is at least 2½ ft thick, and is free milling ore. Years ago ore from this ledge was brought to Grass Valley and yielded by mill process about $15 a ton. The company now running the tunnel will have about 500 ft, average, of backs through the claim.

PLUMAS.

PROFIT OF MINING.—Greenville *Bulletin*, Dec. 28: There is good authority for the statement that a small mill near us is paying $3,000 a month to the owners. They make no fuss about their mill or mine; the firm consists of two or three members, who are themselves practical miners. This shows of what the district is capable. No doubt but a number of such mines will be developed in the near future.

SHASTA.

FRENCH GULCH.—Cor. Shasta *Courier*, Dec. 31: The miners are still on the dry list, except the Lambert mine on Deadwood, which is running day and night and its finances a sealed affair; but a contract given by the company to cut 2,000 cords of wood, and 600 cords on hand, with a wagon road contract to the main road to the Tower House, are solid evidences of success.

SAN DIEGO.

JULIAN AND RANNER.—Cor. San Diego *Union*, Dec. 29: The Eagle mine at the town of Julian, owned by Crays & Duffee, is giving good returns. They have just completed a crushing that paid them $20 per ton. At this time they are getting ready to take out a large crushing.

They have a fine body of ore 20 inches in thickness, in soft picking ground. Mr. Crays informs me that they mine and place on the dump one ton of ore a day per man; that the conveying to mill and milling costs them $4 per ton; and that they can make good wages with ore that yields $8 per ton. The Andy Johnson was the next point I visited. Here I found Mr. Sallor pushing forward a new level to tap some rich ore that he had recently found in the old works. He seemed very much elated with his prospects.

Blue Hill District.—I found Mr. Gardner, of the Gardner mine, getting ready for the water months. He has some very fine ore out. The Ready Relief, in Banner district, is taking the lead. At the mill they are pounding away on ore that shows plainly mf free gold. Twenty men are now at work lo the mine. The slope that is giving the best ore is over 100 ft in length, with a vein of 30 inches in thickness. In all good pay matter. From my knowledge of things, I should think that they have out and in sight, enough ore to pay for the property and a surplus that will allow good wages for themselves. The owners—Messrs. Bally Bros. and Baruch—purchased the property last spring, which was at that time in a dilapidated condition. Now it is a well developed property.

The Humboldt Mine.—At this mine things are rather quiet and mixed. Only two meo are at work in the old level. There is a good 5-stamp mill belonging to this mine, and with some capital and proper management, this should be a good property. The Golden Chariot mill and mine are fast going to decay. Here is a good chance for some parties to start mining. About 5 miles southeast, on the line of the Ready Relief and Chariot, through the brush, I came to the Oriflamme mine, the property of Mr. T. L. Rogers, of Sao Diego. The mill at the Oriflamme is the best free gold mill in Southern California. There are 10 stamps and 3 concentrators; the tables are covered with silver-plated plates, something over 100 square ft; and there is also arrangement for blankets. Every provisloo is made to save the free gold, and also the sulphurets which, Mr. Buck informs me, are about 1½ .. The water supply has been very short, so much so that the mill could not be run more than half the time. For this reason crushing has been discontinued until the next season begins—everything being in readiness when the time comes. The Stonewall mine was the next point to which I directed my steps. Here I found things in a rather tumble-down state, so much so that I did not remain in the mill but a short time, thinking perhaps it would fall next. The past record of this mine is good.

SIERRA.

Closad.—*Mountain Messenger*, Dec. 28: Eureka Con. is closed for the season. The Elutracat gravel mine is closed down for the season.

The Last Chance are sinking at the end of their tunnel. They are down in gravel 30 fs: no bedrock yet.

Reported Sold.—The St. Charles bill quartz property, is reported sold to San Francisco parties.

At the Marguerite mine, at Loganville, things are pushed lively. The hoisting works are under roof. The mill is expected to be running in about one week. One Thousand and One mine at Chips hill, has been running through bedrock for 70 ft, and at last accounts, struck very fine looking gravel. The shareholders feel very highly elated over it. The tunnel of the Blue Gravel Con, is in 700 ft; the last 80 ft have been in bedrock. At last accounts gravel is coming in on the top.

Haskell Peak.—The tunnel of this company is in 1,200 ft. They expect to run 200 ft further and then sink. The bedrock was dipping. They expect to strike bedrock by sinking about 100 ft.

Good Hope.—Quartz is being hauled to the Good Hope mine, and crushing will be made as soon as enough rock is at the mill. The Rising Sun, at Thompson's ranch, has a tunnel in 700 ft. The channel is 400 ft wide, but unfortunately is too high. They expect to start a new tunnel near the river.

NEVADA.

WASHOE DISTRICT.

Yellow Jacket.—*Enterprise*, Jan. 3: The east crosscut on the 2828 level, 275 ft south of sbaft, was ruo 21 ft; grouod, porpbyry and quartz. Gn the 3000 level the east crossdrift from switcb east of sbaft was exteoded 24 ft, making the present length 356 ft; ground hard, with quartz and clay seams. Owiog to the shutting down of the Belcher and Crown Point pumpiog engine for repairs, we have an increase of about 6 inches of water, making about 63 inches (miner's measure) per day.

Union Shaft.—Have completed the 2600 bob pit, are easing timbers in the shaft and repairing 1600 drift to the Sutro tunnel.

Consolidated Virginia.—Still clearing out and repairing drifts and winzes conoecting with the old Consolidated Virginia shaft on the 1000 and 1700 levels.

California.—Are still engaged in cleaning out drifts and winzes conoecting on the 1000 and 1700 levels with the old Consolidated Virginia sbaft. Gn the 2700 level the joint California and Ophir east drift hole has been extended 80 ft.

Sierra Nevada.—On the 2500 level have completed the chamber for winze in No. 2 east crosscut, aod are cutting out chamber for winze in No. 3 crosscut. Oo the 2700 level have completed draio and timbering up in the joint Union Consolidated east drift.

Union Consolidated.—The malo north lateral drift has been extended 80 ft and the main sonth lateral drift the same distance. Have commenced south drift No. 2 aod put the switch plates in place.

Ophir.—Are repairing the joint California drifts and winzes on the 1700 level. During the week 208 tons of ore have been extracted, and 158 sent to the mills. Assays not received from the mills. Bullion to the value of $18,541.68 was shipped last evening.

CANDELARIA DISTRICT.

Northern Belle.—*True Fissure*, Dec. 31: There has been very little change io the appearaoce of the mloo cince last report, all work having progressed io a satisfactory maooer. The average daily yield of ore from the mine has been about 66 tons. The cleaning up at mill No. 1 is nearly completed, aod it will be obut down for the present. Mill No. 2 is doing the usual good work. Bullion shipments for the week ending Dec. 28th, $15,505.41. Shipmente on December account to Dec. 28th, $63,578.31.

Mount Diablo.—The winze from the west drift on the 2d level has reached a depth of 48 ft and still shows the streak of ore mentioned last week. Assays of ore taken from this point go from $90 to $121. The east drift on the 2d level ebows marked improvement, the ore looking very promising for opening. Assays from the ore taken out while running the drift yield from $60 to $98.

Lucky Hill.—Good progress has been made this week in the northeast drift, which is now advanced a distance of 07 ft. A strong ledge of low grade ore has been cut in going the last 10 ft, which may develop into something more valuable.

Princess.—The gallowe frame is nearly in place, and the grading for a blacksmith shop commenced.

CRABB DISTRICT.

Eaole Bird.—Esmeralda *Herald*, Dec. 31: S. Y. Crabb has resumed work on the Eagle Bird mine. He bas run about 30 ft on the ledge, wblch holds its width of about 3 ft, and continues rich in both silver and gold. J. B. Hill discoverod a ledge about 1 mile from the Eagle Bird, which prospects well in free gold, and is about 3 ft wide. From reliable information we predict that Crabb district will shortly be a bullion-producing section.

ESMERALDA DISTRICT.

Work.—Esmeralda *Herald*, Dec. 31: The hille are full of men doing assessment work. Work still continues on the Centennial, pushing the incline down. The ehowing in the bottom speaks well for this little bullion-producing mine. The connection wae made in the Cortez on Christmas eve, and one can now go luto the mine at the upper tunnel, pase down the incline and come out at the mouth of the lower tunnel. A chute will be put in the incline sbaft to run the ore from the upper workings of the mine to the lower tunnel, which is on a level with the ground where the company iutend to build their mill in the spring. Supt. Wells, who, by the way, has proved to be the best manager that ever took hold of a mine in this camp since we have koown it, intends to push developments, and will start the incline down and also run drifts east and west from the lower tunnel level right away. By next June the Cortez mine will have developed and on the dump ore enough to run a 20 stamp mill for an indefinite time, if Judge Wells directs the work.

EUREKA DISTRICT.

The Bowman Mine.—Eureka *Sentinel*, Jan. 1: Since the resumption of work on this property no time has been lost. About 40 tons of ore are being extracted aod shipped to the furnaces every month that average over $100 per ton. Seventeen meo are employed in the mine and above ground, and the mine is paying expenses. M. H. Joseph, who was through the Bowman mine yesterday, says there is a splendid prospect developed on the 113 level. The vein is striking northwest and dipping northeast. The ore carries three-fourths of its metallic value in gold.

Eureka Tunnel.—*Sentinel*, Jan. 3: Another magnificent specimen from the Eureka tunnel was brought down to the company's office on Sunday evening by the assayer, who stated that that kind of rock would assay about $1,000 to the ton. It was taken from a drift ruo from the 50-ft winze statioo. It shows black metal and yellow chlorides in abundance. As far as explored by the drifts the ore body is growing stronger, and every day adds to the value of the mine. Slight trouble is being experienced at the bottom of the winze from impure air, a depth of 80 ft having been reached on the incline in solid ore. Air pipes have been ordered, and will be placed in the tunnel as speedily as they arrive. This will necessitate a furnace, for which the brick, etc., have already been purchased. The north drift of the tunoel is also showing exceedingly well, and a bonanza in that direction is confidently expected to be developed in a short time. The ore so far encountered in this drift shows strong in gold. There are now 20 men employed in aod about the tunnel, and this force will be doubled when the air pipes are laid.

JEFFERSON DISTRICT.

Dodge-Russel.—Belmont *Courier*, Dec. 24: Jos. Enghouse writes from Jefferson that the Dodge-Russel mine is looking well, and will in the near future be classed among the leading mines of that district. He also writes that the Harrison Bros. are extracting very rich ore from the Hillside mine, and are shipping bullion 997 fine. It is a well-known fact that rich mines exist in Jefferson canyon, and all that is lacking is capital to develop them.

LEWIS DISTRICT.

Starr-Grove.—Lewis *Herald*, Dec. 28: The new incline in the Starr-Grove is still being pushed ahead, and the ledge is slightly improving. The stopes are looking well, and considerable ore is being taken out. No difficulty is experienced in keeping the water out. It is the intentioo of the management to replace the present machinery with much larger compressor, engine, pumps, etc., when the mine will be thoroughly explored and large stopes of ore opeoed up.

Highland Chief.—A vein of ore has been struck in the Highland Chief mine in the crosscut. The ore is rich, and about 18 inches in width, and is near the hanging wall, distant about 25 ft from the foot wall.

Betty O'Neal.—But little cbaugo bas taken place in the last week. Sinking is still going on, but as the main shaft is being sunk west of the ledge nothing can oe definitely stated till conoections are made and levels ruo.

Eaole.—The tunnel oo the Eagle mine is being driven ahead as fast as circumstances will permit, and the ledge is improving botb in size and quality.

Chlorine.—The main tunnel was advanced coosiderably during the week, but bas not reached the ledge yet.

MOREY DISTRICT.

Proper Credit.—Cor. Belmont *Courier*, Dec. 24: All the flattering reports cooccrning the coodition of the mines aod wonderful mill operations whereby ores cootaining large percentages of sulphur, zinc blende, antimony, etc., combined are worked tn 90%, producing bullion 940 fine, are true; in fact, I learn from official source that the chlorinations for several consecutive days have attained as bigh a percentage as 07%. Tbe roaster employed is not adapted for the character of ore above mentioned, being ao original White's rotary furoace. It has been improved, however, and by close attentioo aod proper understanding of the manner of treatment proaises above results. The future prospects of the camp are brilliant, aod there is no doubt that when the mines are opened deeper the property will be classed among our regular dividood-paying institutions. Mr. Max E. Bernheimer, formerly conoected with the bankiog business io New York, is the Supt. and general manager; Mr. J. H. Bryden, formerly conocected with mills in Wblte Pine, and late chief engineer at Tybn Con. Co.'s mine aud mill, is foreman of the mill; Mr. A. McArthur, for the past 15 years connected with practical mining on tbis coast, is foreman of the mincs, and to tbese three gentlemen should the whole credit of Morey's present success bo attributed.

OSCEOLA DISTRICT.

No Water.—Ward *Reflex*, Dec. 27: The people of Osceola have entertained the hope for several years past that water would be brought into the placers by Oodby & Co., but have been disappointed. From Dan Morris, who has been stopping in Ward a few days we have learned what's the matter. After purchasing a large tract of placer ground in Osccola, Godby & Co. found they had overreached themselves and that it would be necessary to go elow for a time. Water will come into Osceola after they clean up other things that will not keep as well as their placer interests. They consider their Osceola veoture the best they have taken chances on, but will be unable tn do anything with it until the presoure is relieved in other quarters.

SACRAMENTO DISTRICT.

The Sunrise Claim.—*Silver State*, Dec. 28: Marion Howell and "Poker" Brown have a mining claim in Sacramento district which they call the Sunrise. They have ouok a sbaft over 100 ft on the ledge, which is from 1 to 2 ft wide, and carries ore that assays as high as $1,000 to the ton. "Poker" Brown, who some years ago had a national reputation, was in early days lucky at everything but poker, and made several fortunes which he lost at the game whose name be bears.

TOIYABE DISTRICT.

Toiyabe Mine.—Belmont *Courier*, Dec. 24: Work ie progressing satisfactorily in Toiyabe mining district, and the Tolyabe mine, owned by County Clerk Nicholl, is looking well. Recent assays made of ore taken from different portions of the face of the ledge gave $47.13; $31.42; $15.75; $113 09 and $6.28 in silver. The ledge at present shows a width of 8 ft, and the hanging wall has not yet been reached. Undoubtedly the mines of tbis district will in tbe near future attract the attention of capitalists and mining men.

ARIZONA.

Silver District.—Yuma *Free Press*, Dec. 31: Work on the main shaft of the Black Rock is being continued, and depth rapidly attained. Stoping is going ahead all along the tunnel drift. Pickeubaok is pushing his contract on the Silver Glance, with much energy. Tom Oilchrist is levelling off ground for the erection of two buildings, the lumber for which will arrive by the next steamer. Pacific City is becoming the center of attraction, and is growing up like a muebroom.

Tonto Basin Items.—Arizona *Democrat*, Dec. 28: From Mr. Sam Hill we learn that in the Golden Wonder, now owned by Burdett & Chileon, there has been made another rich strike at a depth of 160 ft. The ore body is 3 ft wide, with a 20-inch seam of $75 ore. They are putting up 4 arastras, to be run by steam power, wblch they expect to have started in about 2 weeks. The Excursion mine is now down 150 ft, with an ore body 4½ ft, which they claim will mill $25. Having struck a large flow of water, they cannot sink any deeper until a pump le put in. The Gowan, owned by Oowan, Bacon and Snow, is the bese claim of the camp, and is a magnificent property. They are down on it 105 ft, and are now drifting. The whole face of the drift is in solid ore, 5 to 6 ft thick, exceedingly rich specimens of which can be seen at the shop of Mr. Hill. What enhances the value of this property, as well as its claim as a big mine, is its facilities for working the ores, a large stream of water running within 100 yards of it which can be had for the running, a 50 stamp mill with water power. Altogether the outlook for Tonto Basin is certainly brilliant and will add in time another bright jewel to Yavapai's cluster of rich mines.

Old Pat.—*Pinal Drill*, Dec. 31. Belonging to Messrs. P. S. Empey and Niemeyer, is situated about ¾ of a mile northwest from the King, near Peachville. They have a shaft about 20 ft deep and have struck a large vein of rich ore, carrying copper and silver, assaying $547.50. There appears to be a considerable body of it. This mine is in the foothills, on 1 of the numerous veins that run parallel with the great Josephine ledge, from the Rosalie to the Pike. All the locations in the belt show great improvement by this years' assessment work, as greater depth is attained, and it leads to the inevitable conclusion that all that is needed on this belt, is to go down, in order to show up a score or more of rich mines.

Cole District.—This is a new district, situated 15 miles in a northwesterly direction from Pinal, and 8 miles from People's cattle ranch, which is about 10 miles north of Whitlew's station. Recent discoveries have caused great excitement here. The Uncle Ben, Uncle Dave, Black Spider and World, all adjoining claims, have been located by Messrs. Thos. Graves, B. W. Kellogg, John Cole and Witrock. The lowest assays, from the surface rock, give $290 in silver and a trace of gold. Theso are contact veins, in a sycnite and porphyry formatioo. The finders came into town for tools and provisions and have gooe back to develop their valuable property.

Cliff.—Is situated in the town of Bello Air. Messrs. O'Farrell and Moyer, the owners, are having a shaft sunk, under contract, which is now down 24 ft, in rich chloride and native silver ore. It is oot known how wide the ledge is, as it covers more than the width of the shaft. They have plenty of ore that assays over $1,000.

Tyndall District.—Arizona *Journal*, Dec. 31: Tyodall district is located on the southern slope of the Santa Rita mountains, is connected with Tucson by a good highway 00 miles lo length, and since the late road improvements, it is passable for large freight teams. The mines are longer known than any in the Territory, work having been commenced on them as far back as the time of the establishment of the Spanish missions by the Jesuit padres. Later on, io 1856 and 1861 work was continued by Heintzelman, Wrightson and Grosvenor, but was discontinued on accouot of Indian outbreaks. Security of life and property having been established by the energetic means of the Territorial goverument, work on the various claims was re-commeoced about 5 years ago, and by dint of enterprise and hard licks, the deserted camp occupies to-day the most prominent page in the miolog history of Southern Arizona. Two railroads are rapidly approaching the camp and will establish depots within 8 miles. The A. T. & S. F. passing through the fertile valley, the Sonoita, a mountain stream with water capacity for 1,000 stamps or more, will connect with the 1st of May, 1882. Wood, water aod pasture are abundant and in close proximity to the principal mines. The climate is delightful both summer and winter, and owing to sufficieot altitude is entirely free from the malarial diseases prevalent lo the lower districts. Labor can be procured here at the rate of $2 per day, and wood can be loaded at furnace or mill for $3 a cord. Building material to the shape of timber is found on the north side of the Santa Ritas, and white sandstone about ¼ of a mile from camp in exhaustless quantities. Amoogst the principal mines in the district are the group owned by Charles Atschul, Mark Ezekiela and the Lully brothers, comprising the Major, Beckie and Charley, Oakland, Southern Pacific and the Lully.

Orano Central.—Tombstone *Epitaph*, Dec. 1: Have commenced to put in a station at the 500 level, new shaft. Crosscut on the 300 level in 200 ft, having cut the ledge, which is 25 ft wide. The ledge looks well and assays are favorable. South drift, east vein, on the 500 level is in 46 ft. The ledge at this point is very rich. The stopes are looking well and turning out 100 tons daily from the old works. They have a reserve of 1,000 tons at the mill, which is daily increasing.

Tombstone M. & M. Co.—They struck a new body of ore in the northwest workings about 10 days ago, upon which they have gone down 35 ft. It is from 2½ to 3 ft wide. This is an important strike, as it is entirely new ground and disconoected from any heretofore known ore bodies. Are shipping from 8 to 0 loads to the mill per day.

Contention.—Timbering still being done on the 400 level preparatory to stoping. Stopes all looking well and turniog out the usual amount of ore. The machinists are overbauliog the engine at the new shaft, at which work will be resumed early this month. Are sending 70 tons of ore to mill per day.

Woronoco (San Diego) M. Co.—On Friday a very important strike was made on the 266 level, 80 ft from the shaft. The ledge at this point is nearly 3 ft wide, and is yieldiog all pay dirt. The ore is carbonato distributed through a decomposed quartz, small pockets of which give a very bigh assay. The upraise is showing up some fine looking ore.

Head Center.—The mine is being worked in the usual quiet way and sends ore to the mill sufficient to keep it running at its full capacity.

COLORADO.

Will Start Up.—*Register-Call*, Jan. 3: Sylvestor Nichols last evening received a dispatch from Mr. George W. Mabee, now in New York, to let contracts for the grading off for a sbaft building to be placed over the Clay County mine, Lake district. This property, of which Mr. Maybee bas a lease, is owned by Hon. Jerome B. Chaffee. Another one of the idle mines and former producers will add ber share to the gaiety of the scene.

Williams Fork.—George Applegate arrived io this city last evening from the mines on Williame Fork, Grand county. He experienced great difficulty in crossing the range, which he accomplished on enow shoes. He reports work progressing slowly but surely on the veins partially developed last summer and fall. Those who were fortunate in getting their tunnel approaches under cover, are developing most of the time. Mr. Applegate, after visiting friends near Fort Collins, will return.

The Bobtail M. Co. have raised the pumps from below the 600 levele, and will develop the mine above that point.

Tropic.—From Mr. John Gilbert, who was a visitor to Central last evening, the information is gained that the Tropic mine is looking better than ever in the level workings.

New Mill.—The new 5-stamp mill just completed at the Eureka foundry, was started up this morning.

Purchased.—It was reported on the streets last evening that the United Gregory mining company had purchased that portion of the Gregory lode belooging to the New York and Colorado Co., east of and adjoining the former company's property.

Mr. W. B. Brown, an old resident of Nevadaville, who has been taking in the San Juan section and the Gunnison and Lake county mines has returned, after an absence of about a year.

IDAHO.

Gold.—Wood River *Times*, Dec 28: A rumor is in circulation here that the Mayflower, Eureka and Jay Ould mines, of Bullion, have been sold to ex-Oovernor Tabor and 2 other equally prominent Colorado capitalists, for the sum of $450,000, ¼ of which has been paid down, the balance to be paid by the 1st of July, 1882. The owners are men who thoroughly understand mines and mining, and it is therefore not probable that they have sold for $450,000 property believed to be worth 3 times that amount. The price paid by the Toledo Co. for the Ouy mine, of Rock creek, was $13,000 cash. Messrs. Garrard & Campbell, former owners of the Guy, have just received the coin. They are now prospecting out Snake river way.

The Strahorn Claims.—While here last summer, Robert E. Straborn, chief of the literary bureau of the Union Pacific Railroad, purchased a controlling interest in 5 claims situated on Bald mountain, opposite Hailey, and put a force of men to work driving a tunnel by contract. Appreciating the great value and advantage of depth in mining operations, Mr. Strahorn determioed to start his tunnel so as to strike the ledge at a depth of at least 250 ft. This tunnel is now in about 185 ft, and the ledge is expected to be cut in about 60 ft more.

MONTANA.

The Stevens.—*Inter-Mountain*, Dec. 27: Work on the Stevene mine is pushed ahead with vigor. The mine is looking well, especially in the east level from the main shaft. This level is now advanced on the vein for a distance of 220 ft east from the 200-ft station of the main shaft. In the end of the level the ore is rich, showing plenty of native and wire silver, with the lowest assays running 100 ounces to the ton. Sinking winzes on the vein, both in the east and west levels, as deep as the water would permit, shows an improvement in the size of the vein and in the quality of the ore. At the west, or whim shaft, a winze has been sunk from the 90 level on the ore velo. The ore assays 80 ounces in silver to the ton. At the 200 level in this shaft a crossent has been driven across the vein, showing ore of a similar grade to that found at the 90 level. There is a large amount of ore now opened up in the Stevens.

Morning Star Mine.—At the Morning Star mine an excellent quality of ore is coming from the west level, which is in a distance of 170 ft from the 220 level. The last assays of ore from this level run 69 and 128 ounces in silver and $18 and $25 in gold to the ton. Four stopes have been raised in this level to the bight of 21 ft each. The mine is yielding from 8 to 10 tons of ore daily, which amount can be easily increased. The water, although heavy, is under easy control. During the last week 80 tons of the first-class ore from this mine was hauled to the Colorado smelter, where it will be reduced.

NEW MEXICO.

Mineral City.—Blue Canyon *Drill*, Dec. 20: With an abundance of mineral in paying quantities, plenty of coal, wood and water for the asking, a town site surveyed and recorded, post office and mail line established, the district populated with an experienced, pushing class of miners, who believe in developing their claims, and are reluctant to sell them, what's going to prevent a boom in the spring?

Consolioated Claims.—And oow Mineral Hill, not to be outdone by older and more preteotious camps, is to have a joint stock company. The owners of 10 claims—all located io a buoch at and near the junction of Blue and Gold creeks lo the Blue canyon—in connection with several Eastern capitalists, have decided to pool the several properties, form a company, and issue stock to the amount of $1,000,000. It is understood that about a quarter of the stock has already beeo spoken for, and that money enough is insured in advance to enable the gentlemen to commence developmeot at an early date. The John Hancock, a 40-ft cut and tunnel; the Ellen Wood, a 20-ft cut and incline; the Optic, a 30-ft cut; the Providence, Little Frank, Robert Newton, Surprise and Holy Terror claims, are all reported io on the pool, and are so situated ou either side of the canyon, that their ores can be deposited at the junction of the creek at a merely oomioal expense.

Notes.—Rocky Mountalo *Mining Review*, Jao. 3: Mineral City is to have a oew 25-ton smelter. Rincon district is furoishing excellent specimens of ore. Many gold placer claims are staked off in the Black Range. A recent rich strike was made in the Socorro district, giving an assay of $710 per ton. Several important sales have been made in Grant county during the last 2 or 3 weeks. The smelters at Cerrillos are being pushed to completion as fast as material can be secured. It is claimed that White Oaks is situated oo a coal bed, with rich gold lodes sandwiched between lava beds and rich placers. There will be a large amount of development work done in the Silver City district, and we predict that the output of bullion during the comiog year will be very large. Good Hope mine, Carbonateville, with several others has been sold to a London, England, company, who will proceed at once to develop them, and to erect buildings, offices, etc. They will probably also sink a new shaft. A new assay office will be erected, and Prof. Robinson, of Las Vegas, will have the management. The Clifton copper mines are said to be far superior to those of Lake Superior. They are situated oo the dividing line between New Mexico and Arizona. M. Lesinsky & Co. have built a 20-inch gauge road to their main works, at a cost of $30,000. These mines may prove a big bonanza, and will add a large amount to our country's resources.

Taos District.—Activity in the various mining camps in Taos is grea., aod the progress of development really astonishing. Claims are changing hands aod new companies are being organized every few days. Santa Fe men are investing heavily on the Arroyo Hondo, which camp is acknowledged to equal any silver camp io the Territory. The small amount of development in the Staple mine is an evidence of what there is in that camp. At a depth of 45 ft the mineral runs from 500 to 1,000 ounces in silver, and some pockets run as bigh as 87% silver. There are other claims on the same lode equally as rich, on which little development has been made, but the surface indications of which are even richer than the Staple.

In Spring Gulch, about 7 miles from the Arroyo Hondo, work is progressing with a fine prospect in sight. Messrs. Cooper & Bridgee are driviog a tunnel to cut 2 big lodes that show galena on top, and when into the seam will be 100 ft underground.

On Copper Hill work is lively. This camp is attracting more attention from Eastern capitalists than any of the others. Several claims have recently been sold to Eastern men at good figures, and on 1, purchased from William Anderson, a contract for sinking a hundred ft shaft has been let.

On the Rio Honno all is quiet at present, and little work is being done; nevertheless, claims are changing hands at high figures to Eastern men who will rush development shortly.

The Allen coal banks are being worked vigorously. Several other veins have been discovered lately and are being opened up. Taos county will astonish its neighbors when the coal fields are fully developed.

OREGON.

Notes.—*Democratic Times*, Dec. 30: A great deal of rain has fallen during the past week, and the miner is happy.....The minere of Oalice creek have an abundance of water and are improving their opportunity.....From W. H. Benner we learn that piping has been commenced in earnest at the Centennial mine.....M. M. Obenchain and Mr. Mullen will work 1 of Ben Miller's claims on Sardine creek, this winter.....The ground is well soaked with water and but little more rain is needed to start all the miners agoing.....Excellent rock is being taken from Geo. Schumpf's ledge in Willow Springs precinct. There is plenty of it in sight.....The Josephine mine, over which Bybee, Robineon and others are having much litigation, will lie in *statu quo* this season. .....Enoch Gale and John Cowan who have rented Jas. G. Birdsey's mines on Birdsey creek, have commenced work after getting everything into ship-shape.....The hydraulic mines, with the exception of the Squaw Lake Co.'s, are at work with a good supply of water. The latter will also be running as soon as the reservoir is completed and the new pipe placed in position.....From J. W. Howard, of Calice creek, who is spending the holidays in Jackson county, we learn that Green Bros. are taking out an unusually fine quality of quartz, which is supposed to average $100 per ton. The ledge is nearly a ft and a half wide and constantly getting better. The tunnel has proved a success. We are glad to hear this..... Our Waldo correspondent writes: Miners of Josephine county are generally at work.....T. F. Dugan, at the Carron mine, is sluoing and washing double the amount of ground got off in former seasons.....The Mount Pleasant Co. have located 80 acres of ground that prospects well. Their ditch is under headway and will be completed by March.....Wimer & Simmons are getting off a great amount of dirt, running night and day with 8-hour shifts.....DeSellee & Co., at Scotch gulch, have already enough ground run off to keep them cleaning up for several months and will start their elevator soon.

A Great Triumph.

The History and Features of the Studebaker Wagon.

As an illustration of American industry, wrought out and brought to the most perfect system that has ever been devised for the manufacture of the modern wagon in any portion of the world, we produce on this page a cut of a portion of the celebrated manufactory of the Studebaker Bros. Manufacturing Co. at South Bend, Ind. The upper cut, showing a structure whose exterior has the appearance of some grand opera house or bank building, is only the repository and manufactory for the landaulet, barouche, phæton, buggies of every description, and light and fine vehicles that are used by our merchant princes, hackmen, horsemen and pleasure seekers in city, town and country, plantation, ranch and farm, from Maine to Mexico. The exquisite finish, excellence and artistic taste displayed in this branch of their business is such that large repositories have been established in Chicago and other great centers for the sale and display of this class of goods.

The lower engraving represents the main portion of the Studebaker Bros. Co.'s Wagon Works, which now, with buildings, sheds, drying houses and accessories, cover 27 acres of ground, to which they have added the last year 58 acres more. The main buildings are four stories high, built of brick, and in architectural design and finish, with turrets and smokestacks, represent a scene of beauty and progress that is part of the history of this country. As we view this labyrinth of American industry, we fail to grasp its immensity, unless with yard-stick and pencil we measure and count. There are over 17 acres of flooring; over 10,000,000 bricks in the main buildings; over 1,000-horse power in steam engines; over 2,000 ft. line shafting, not including countershafts; over 4 miles of belting, some of which is 36 inches wide, and over 1,200 men, molding and fashioning the Studebaker wagon, with sunlight by day and the electric light by night. Steadily has the demand and sale of this wagon increased; and as surely preparations have been made to meet the demand. The last year, 1880, 26,000 wagons were sold, and this year, 1881, will exceed 28,000—the largest number of vehicles manufactured and sold by one firm in one year in the United States or any other country.

It is marvelous beyond precedent in the history of a wagon manufactory to see in the packing and shipping department and side tracks at South Bend, Indiana, trains of railroad cars built by the Studebaker Bros. for their own use (larger and wider than the ordinary baggage car), filled with boxed carriages and heavy wagons of all kinds, and marked "Afghanistan, Quartermaster's Dep't, British Army," "Egypt," "Syria," "Sandwich Islands," "Australia," "Cuba," "Paris," "San Francisco," and to towns and cities in all parts of this country.

In the year 1852, Clem Studebaker and Henry Studebaker opened a small wagon shop in South Bend, Indiana, in which they managed to turn out two farm wagons during that year, one of which is in use now. During 1874 their loss by fire was 2,400 wagons, and property valued at $300,000; but the indefatigable brothers soon built on a larger scale than before. In 1880 the Studebaker Bros. Manufacturing Co., consisting of the following brothers: Clem Studebaker, Pres.; J. M. Studebaker, Vice-Pres.; J. F. Studebaker, Sec'y, and P. E. Studebaker, Treas., had facilities for, and did build and finish, a wagon or carriage on the average for that year at the rate of 100 a day, or one every five minutes, counting eight working hours a day. Their combined capital at the commencement was $66. At this time it is millions. For these fabulous results there must be a cause, and it may be well for us to stop and inquire what it is. In this connection we shall refer back to the first "Studebaker" wagon ever built.

John Studebaker, the father of the present Studebaker Bros., after six years of an apprenticeship in Gettysburg, Pa., in the wagon trade, commenced business for himself, and built a new wagon for farm purposes, whose contour and style has only been improved by his own boys. The wagon was made as well as intelligent mechanical labor could make it. It laid the foundation upon which he amassed a considerable fortune which was swept away by the betrayed confidence of a friend. Through these dark days he trained the sons in the art of knowing the strength of wood when combined with iron and making a neat, tasteful and easy running wagon that would last in use a quarter of a century. That knowledge, to which has been added all that inventive genius, science and modern improved machinery could do, has made their name a household word, and their achievements in keeping with the grandest triumphs in art, and the great inventions of the 19th century. In view of the possibilities and grand results of well directed and intelligent mechanical labor in this country, as shown by this great American firm, who started in life as poor, practical mechanics and for over a quarter of a century have steadily continued in the same business only to swell into greater proportions and develop the modern perfected wagon—no motto could be more appropriate than that over the main door of the largest wagon manufactory in the world.

"Established 1852."

"Labor Omnia Vincit."

"Studebaker Bros. Mfg. Co."

It is often said by men who have used the Studebaker wagon, "I have not had $5 expense on my 'Studebaker' in five years," "That Studebaker gearing of mine has worn out two bodies and is good yet." "I save one-fourth of a horse-power on every 'Studebaker' wagon I use." Having this reputation we will endeavor to show why and how it was obtained:

1st—The best of timber of every class, and especially that of Indiana, is used.

2d—Every stick of timber is seasoned from five to seven years, and the entire woodwork is saturated in boiling oil to render it impervious to moisture.

3d—The wood passes triple inspection and is tested by machinery and worked by selected and the best skilled mechanics in the world, who work with such precision that if you gather up distinct parts of the wagon made by different persons, they will be found to fit with almost the nice precision of the works of the Waltham watch.

4th—The patent bevel-edge projecting tire eaves the paint on the felloe, and consequently on rocky roads and ruts protects the wheel.

5th—The skeins are set by a patent skein

STUDEBAKER CARRIAGE WORKS, SOUTH BEND, INDIANA.

setter, which takes exact pattern of the inside of the skein to which the axle is to be fitted, thereby making a true fit and a perfect running wagon. These parts are also made of selected iron, very heavy and are fitted to such an exactness that the farmer of Sacramento and Stockton can exchange wheels with impunity.

6th—The Studebaker is the only wagon in which the slope shoulder spoke is used, which are driven in by a "Tom Sayers" trip hammer and the tires shrunken on by lowering it all at once on a horizontal platform; making a wheel that will last as long and longer than other parts of the wagon.

7th—The hubs are all bored true, then the skein boxes are turned on an iron lathe to fit, and pressed in by hydraulic pressure of 150 tons, insuring a perfect joint and allowing no oil or water to soak in, as the case is when the boxes are wedged in.

8th—All the thimble skein wagons have the Studebaker patent skein and truss axle which greatly strengthene the axles. These improvements cannot be found on any other wagon.

9th—In painting these wagons only the pure lead and best oil is used; no cheap minerals or adulterated lead are allowed on a Studebaker wagon.

10th—Every piece of timber and iron or steel is subjected to inspection and scientific tests by the most skilled mechanics, and if not up to the standard is rejected.

11th—They make the best wagon that improved patents of their own or that can be used to advantage, and will not allow any wagon to pass from these works unless it bears the old and reliable brand "Studebaker Bros. Manufacturing Co., South Bend, Indiana."

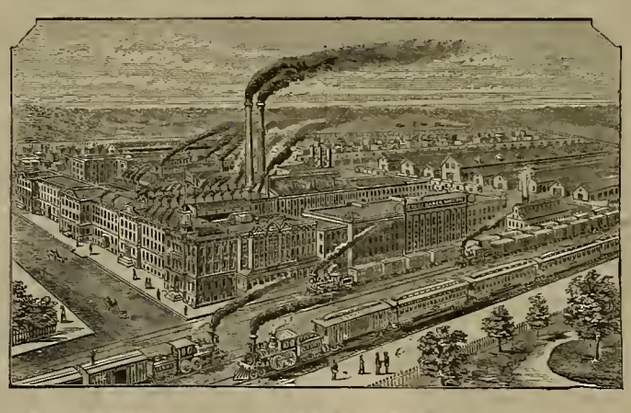
12th—The Studebaker wagon is the acme of perfection, perfected by the combined mechanical talent and inventive genius of two generations.

It has been and is the ambition of this great American firm to make a wagon that was adapted to the wants of every locality, and that they could have the whole world for a market. They have traveled in different States and countries to gain information as to the requirements of different localities. Over 20 years ago the vice-president, J. M. Studebaker, was a resident of California, where he as a practical mechanic fashioned, built and studied the best manner to construct a wagon for the Pacific coast. His store of knowledge was carried back where improved machinery could be had to fill this demand. From time to time the different members of the firm, J. F. Studebaker, Sec'y, and Supt. of the carriage department; P. E. Studebaker, Treas., and Clem Studebaker, Pres., have visited this State. The president has made frequent visits, extending as far back as 1868. During the past season he traveled extensively on this coast as far north as British Columbia and as far south as Mexico, and with prophetic vision saw that the varied industries, resources and future greatness of this western empire would demand increased carriage facilities.

The large and increased sale of Studebaker wagons in California for 1881 and demand induced the Studebaker Bros. Manufacturing Co. to enlarge the Pacific coast branch, and selected San Francisco as the distributing point, with agencies in all the principal cities and towns.

A repository was opened at 31 Market street, and a large warehouse secured near the railroad depot, 4th and Townsend, for storing their goods. The Studebaker railroad cars were immediately switched up to the five-story shipping and storage apartments at South Bend, and their own cars were filled with all classes of vehicles for the "Pacific Coast Branch House."

The fiat has gone forth and will soon be passed along the line from Alaska to Arizona and to the Islands of the Sea, that the teamster, farmer, drayman, hackman and horseman can have a Studebaker wagon. That landaulet and rockaway, buggy and barouche, three and four spring and platform spring wagons, farm and freight wagons, wide and narrow tires, header trucks—in fact, everything that runs on wheels and enters into the development of this Western slope, will be kept in stock, and is now ready for distribution at 31 Market St., to those who wish to secure a wagon, cart or carriage made by the "Studebaker Bros. Manufacturing Co., South Bend, Indiana.



STUDEBAKER WAGON WORKS, SOUTH BEND, INDIANA.

We have endeavored to show how the Studebaker wagon is made, its superiority and growing demand for their modern perfected wagon. Their success and the results that have been attained by following one rule, viz: They make a safe, durable, easy-riding, light-draft vehicle, adapted to every business and suited to the taste and requirements of a progressive age; and sell them at *fair* prices.

The Studebaker wagons and carriages have entered the broad field of competition at county and State fairs; the United States Exposition, 1876; World's Great Fair, Paris 1878, and won first prizes and silver medals, but the best award is the increasing demand each year in the industrial fields of America.

The French government has a Studebaker army wagon on exhibit in the great National Military Museum in Paris.

As a nation we are proud of our national achievements in science, art, mechanical excellence, and improved labor-saving machinery. No better illustration of the way the genius of Americans meets the necessities of this age, can be found than the triumphs of the Studebaker Bros.

In the history of this great American firm, who have followed one line of business for 30 years, and are bound together and as closely allied in their prosperity as in their boyhood days, we have a commendable example of American progress and enterprise. If so much has been accomplished in the broad field of life by these four brothers, whose only legacy from sire to son was mechanical skill, industry and strength of purpose, in so short a time, every American youth and middle-aged man can take heart and with confidence move on where broader fields and better opportunities for honest, well-directed mechanical labor are brought to view as each new railroad penetrates the stillness of the forests or opens to industry the rich valleys of the West.

Lectures to Young Mechanics and Apprentices.

Color Blindness.

On Thursday of last week, R. D. Johnson, a student in the Pacific Medical College, delivered one of the course of lectures being given to young mechanics and apprentices in the hall of Capt. McNevin's Nautical school. The subject was "Color Blindness." After a description of the eye and the *tholamus opticus*, the seat of color in the brain, the lecturer said: "This subject of color blindness has recently attracted a good deal of attention among railroad and steamship men. It is especially important that every officer of every ship and every railroad train should be examined for color blindness, and with crews of ships the examination should not cease upon the sailing of the ship from port. The master of every ship should continue the examination of his men from time to time, and especially after sickness or any great excitement, for a very great sympathy exists between the body and the optic nerve. Any arrest of the development of the *tholamus opticus* by a blood-clot in the artery supplying sustenance to that particular portion of the brain, or through any other cause, may cause color blindness, and is probably the most common cause. If it is caused, however, by a defect of the eye itself, it is incurable. Red and green are the two colors most confounded, and the cause in such cases is generally congenital. Medical statistics show that one man in every 20 is color-blind. The blindness may be hereditary, or acquired, but in either case the eye seldom presents any abnormal appearance. Dalton, the celebrated chemist, could not distinguish pink from blue, and thought that red was blue and yellow. He was not aware of his own blindness for a long time, thinking that there was some confusion in the nomenclature, rather than in his sight."

When the lecturer spoke of Dalton he took a small pointer and attempted to point out the pink and blue on a screen of color bars over the blackboard, but hesitated, and at last said: "Well, Dalton could not distinguish, and I hardly can." As his pointer hovered uncertainly over the line of colors, one of the class stepped forward and said kindly, "that's the pink." A shout of laughter greeted his efforts, as he had pointed out the yellow. Mr. Johnson continued: "Dalton thought that the vitreous-humor of the eye absorbed the red, and gave it a blue tinge, as that is the color of the vitreous, but this is not so, as can be demonstrated by looking at the spectrum colors through a blue lense, all of the colors, if the sight is perfect, remaining distinguishable, though tinged with blue. The seat of color in Dalton's brain was found to be defective. This is a fault that can be remedied, if the color blindness is discovered when the subject is young, by the special development of that portion of the brain. The use of yellow lenses for color-blind people is recommended, as it reduces daylight to an artificial light, to which the sight of color-blind people responds best. The explanation of a case where a bar of red is placed between bars of blue and green, and not seen, is that the rays forming the red light are not reflected by the retina, but absorbed and allowed to be carried on.

"The effect of vapors, such as smoke or fog, on ship lights, is in itself a study. We know that vapor between us and the sun make the light of the latter look red or yellow, according to their character. Proportionately the same cause produces the same effect on a ship's light. Where a steamship, with foresail set, is running before the wind, the smoke, pouring from her funnels, is deflected by the foresails in such a manner that it passes between the ship's lights and any one looking at them from another ship. I would recommend, therefore, that steamships do not carry a foresail when running before the wind. If the truth were known, many an appalling accident attributed to carelessness as the cause has been the result of color blindness on the part of some person upon whose perfect sight the lives of thousands rested once too often. Urgent measures speedily applied are required, now that means of testing for color blindness are known."

The Italian hydraulic claim at Loganville, Sierra county, has proven a veritable bonanza for the owners. About $150,000 have been washed out since its discovery some six years ago.

The Engineer.

Some Great Engineering Projects.

The shortening of commercial routes by means of ship railways and ship canals seems to be the great ambition of the engineers of to-day.

In addition to the De Lessepe ship canal at Panama, the Eads ship railway at Tehuantepec, the Florida ship canal, the Cheapeake and Delaware ship canal, the Cape Cod canal, and others in the interior of this country, there are several other important projects of like natnre under way or in prospect in various parts of the world. The old project of connecting the bay of Fnndy and Baie Verte, on the Gulf of St. Lawrence, across the Isthmue of Chignecto, has lately taken new form. It is now proposed to make the connection by a ship railway 18 miles long, thus making a short cut for navigation between the United States and the ports on the St. Lawrence gulf and river, and saving the long and dangerous voyage around Nova Scotia.

The projector of the ship railway, Mr. H. G. C. Ketchom, writes us that the plan grew out of a desire to save lockage and a deep channel in the design of the Baie Verte canal. His first plan was to lift vessels hy hydraulio power on pontoons and then float them throogh the canal. The idea then occnrred that they might as well he lifted to the surface of the ground and hauled across the neck of land on rails. The road may be level and perfectly straight from end to end. The plan has been submitted to the Dominion government and is favorably entertained. Mr. Ketchum has issued an interesting pamphlet relative to the project, which may be oonsidered at greater length elsewhere.

Across the ocean, the constroction of the tunnel under the British channel, connecting England with the continent, is being prosecuted with an energy which is indicative of ultimate sucoess, and thus far no obstacles have been encountered to make the nndertaking a difficult or exceptionally hazardous one.

In France the connection of the Atlantic with the Mediterranean by a ship canal, to save the long and stormy voyage around the Spanish peninsula, is under serious consideration, and the Council-General of the Seine have just adopted a resolution approving of the project.

Tne ship canal aoroes the Isthmos of Corinth, in Greece, to shorten the route to Constantinople and the ports of the Black sea, has, we helieve, heen definitely determined opon.

In the far east a bolder and more important project is in contemplation, with a view to shortening the commercial route to China and Japan hy 600 miles or more. At the head of the Malay peninsula is the Isthmus of Kiaw, connecting Upper with Lower Siam; and hy the cutting of a ship canal at this point, about 30 miles in length, the need of sailing around the peninsula might he ohviated. At Kraw, the Malayan peninsula, which stretches southward for 500 miles to Singapore, is at its narrowest hreadth, and the distance across from the side of the Indian ocean to that of the China seas is fnrther decreased hy the existence of natural waterways for some distance inland from both shores. From side to side it is no more than 50 miles, and the Pakchan river, on the western coast, and the Htssay on the eastern, afford the ready means of forther redocing it. The distance, therefore, over which it wonld he necessary to cnt a canal would prohably not exceed 30 miles. The neighboring districts are known to be fertile and to contain great mineral wealth. A tin mining company has been established for more than 10 years at Malewon, on the Pakchan, and gold has been found in the neighboring stream of the Lenya. So far as known, the engineering difficnlties are not of a stupendous oharacter, and political drawbacks and considerations fortunately do not exist.

The French appear to have taken the lead in proposing this important commercial short-cut, and, if the opinion of the London *Times* is well founded, the government of British India will not decline to actively participate in its execution.—*Scientific American.*

Working Under Water.—We learn from the Des Moines, Ia., *Leader*, that the Wabash Railroad Co. have a diver at work in the construction of their hridges across the Des Moines river at Des Moines, who remains under water five hours at a time, digging and shoveling mud from the hottom of the river. He is dressed in a diver's costume and is let down into a large cylinder. Promptly at 7 o'clock in the morning he goes down and shovels a large tnh full of dirt at the hottom of the cylinder; the dirt is hauled to the top and domped on the outside. The iron cylinder is eunk deeper as he removes the dirt from the inside. At the present time he is working ahout 10 ft. under water. He is hauled up at noon for dinner, afterward roturne to work and remains until 6 o'clock. Two men turn the wheele which work an air pump that supplies the man under water with air hy means of a ruhher tuhe, which is attaohed to the diver's helmet. Ahont a dozen of the large iron cylindere are to he sunk in the bed of the river, and several pilinge driven inside of them deep into the hottom of the river, and then they will he filled with 500 lbs. of rock and grout and cement, and these will furnish the foundation and support of the bridge.

Borax.—Last week 2,500 harrels of California horax were sold in New York at 12 cents per lb.

Useful Information.

How to Prepare Sardines.

Sardines are fonnd in great abundance, at certain seasons on this ooast, and we believe a few have been put up in California oil, and have proven very soperior. We see no reason why the preparation of sardines for the market might not be made a large and lucrative bnsiness here. At any rate perhaps some of onr readers along the coast might like to experiment with sardines for their own ose.

In view of these facts, it may he of interest to some to peruse the following, somewhat detailed, but, we believe, accurate description of the method of preparing sardines in France. The sardine heing a very delicate fish, the utmost attention is directed towards having tbe fish as fresh as possible, and as near as can be to the factory where it is to be oanned. Factories are, therefore, rarely situated more than two or three hours distance from the place where the fish are caoght. The fish are placed on stone tables; women plock off the heads, which operation removes the entrails. The fish are then placed on wooden slats and allowed to drip; are slightly salted, and remain over night. Nsxt day they are again slightly salted, and allowed to dry. The old, and moet approved, method of cooking sardines is to place them in vessels filled with hot oil, where tbey are cooked. When done, they are put into a wire basket to drip. At exactly the right point of cooking, the scales remsin on the fish, which is desirahle. If the cooking has been oarried too far, or if the fieh are too fat, the scales drop off, which impairs the value of the canned fish. A period of from five to six minutes ie ahout the right time for the cooking in hot oil. The fish are then allowed to drip carefully, with the head part downward; when they have cooled, they are placed on tsbles and arranged by women in the well-known tin hoxes in which they come to the market, the oil heing dipped from harrels into the boxes. The oil being more valuable than the fish, efforts are made, without too much crowding, to put as many sardines in a hox as poesihle. The lids of the hoxes are then soldered, and the hoxes are then heated in suitahle receptaclss hy means of steam. The sooner this heating of the hoxes takes place, the hetter. The temperature of the water in which the filled boxes are placed is at first cold, and the steam is gradually introduced. This second heating is sometimes carried on for an hour and a quarter. When the boxes are sufficiently heated, they are sometimes allowed to cool in the water, partioolar pains heing taken always not to move the hoxes too much. Another and cheaper method of preparing sardinss is to cook them without oil in circular ovens. The after processes are the same. Sardines are most highly prized when not too large in size. Those of most approved size are worth six francs per thousand to the fishermen, while the larger ones only command ahout four francs. As sardines are migratory, a shoal of fish remaining at a fishing station for a week and then going off, the largest canners of sardines have sometimes two factories, situated at different localities on the coast. The fishing and canning season occupies about three months, from the middle of May to the middle of August. Durıng the other months the sardine factories engage in the preparation of other food products.

How Can You Tell a Good Cigar?—Tbey used to say that a good cigar could he known hy the light brown specks on it. These were made hy worms, the story was, and the worms were epicures in tobacco, and would touch only the hest. But the chemists soon found a way of simulating these worm specks. So that spoiled the test. Then there was no other guide hut the ashes. If these hurned white, the cigar was good; if not, had. But the enterprising tohacconists soon found a way to make the vilest cabbagenia hurn as spotlessly white as the best Havana. Another test gone. Finally the makers of choice cigars pnt a little red label aroond each. This was thought to be something which would always be a sure guide. And so it would he, hut nnfortunately some of the manufacturers have, hy a strange mistake, put the labels on the cahhagenias as well as the Havanas.—*Boston Transcript.*

To Stain Dried Grasses.—Bunches of dried grasses can readily be dyed of a great variety of tints hy dipping them into an alcoholic solution of the various aniline colors. Some of these have a beantiful rose shade, othere red, hlue, orange, purple, etc. The depth of color can he regulatsd hy dilnting the dyeing solution with water or diluted spirits. When taken out of the dye, the grasses should be exposed to the air to dry off the spirit. Then they are ready to be arranged into hunches or houquete, hut not until they are quite dry. The pink saucers sold hy most druggists contain enough rose dye for two ordinary houquets. The hest way to use it is to wash it off with water and lemon juice.

To Protect Roofs.—It is claimed that a coat of lime, ealt and fine sand or wood ashes, applied as in whitewash, will make an ordinary shingle roof 50% safer from lire through falling cinders, and will also proteot the shinglee against rotting from exposure to the weather and against warping. Indeed, the more weather-beaten the shingles, the greater benefit they derive.

Cement for Glass.

It is well known that when gelatine or gloe is treated with bichromate of potassium, it becomes insoluble after being exposed to the light. Where the exposure has been prolonged, the gelatine is not even effected hy hot water. Thie peculiar change is known to deuend on a chemical change taking place in the materials, the gelatine exerting, under the influence of the sunlight, a reducing action on the chromic acid of the bichromate, reducing the latter to the condition of chromio oxide. This change is olearly iudicated by the change of the material from an orange red to a dark green oolor, the latter being a characteristio indication of the formation of chromic oxide.

This behavior of bichromated gelatinc, ss we have several times pointed out, is the basis of a number of photographic, photolithographic and photo-engraving processes, which have been brought to a high state of perfection. It is not so well known, however, that bichromated gelatine, rendered insoluble by exposure to light, makes an excellent cement for glass. This, however, is asserted to be the fact, and as it may prove useful to some of our readers, we give the following deecription of the mode of preparing and ueing the material for this purpose:

One part of a very pure and colorless gelatine is dissolved in 15 parts of water in which 3 parts of hichromate of potassium has previously been dissolved. This must be done in a dark place, or at least in a room illuminated only hy a weak candle or gaslight. And the mixture itself must be carefully kept from sunlight, hest in a hlack bottle in a dark room. To cement fractured glass fragments together, the edges are first thoroughly cleaned, then slightly warmed, and coated with a *very thin* coating of the cement, in a dark room. The pieces are then pressed together, and, if at all possihle, kept under preseure (hy tying with cord, wire, etc), and then exposed to direct sunlight. If the edges have been thoroughly adjusted and the cement applied thin, even hot water will not separate the pieces. Opaque objects are not so thoroughly cemented together by this mixtore, since the rays of the sun cannot strike the fractured edge throughout its whole extent.—*Manufacturer and Builder.*

Be Your Own Right-Hand Man.—People who have been holstered up and levered all their lives are seldom good for anything in a crisis. When misfortune comes they look aronnd for something to cling to or lean upon. If the prop is not there, down they go. Once down, they are as helpless as capsized turtles, or unhorsed men in armor, and cannot find their feet again without assistance. Soch silken fellows no more resemble self-made men, who have fought their way to position, making difficulties their stepping stones and deriving determination from defeat, than vines resemhle oaks, or sputtering rushlights the stars of heaven. Efforts persisted into achievements train a man to self-reliance, and when he has proved to the world that he can trust himself, the world will trust him. It is unwise to deprive young men of the advantages which result from their own energetic action hy "boosting" them over obstacles which they ought to surmonnt alone.

Good Health.

An Important Question—How do You Sleep?

One of the most important things to know ahout any man npon whom you are going to place any dependence, is how he sleeps. Sleeplessness may sometimes be involuntary. There may have been some shock to the man's nerves which has made him insomnolent; hut sleeplessness is more frequently voluntary. Men choose to push their studies or their work into those hoors when they should sleep. It does not matter for what cause any man may do this, the mere fact of not sleeping spoils his case. He may spend his nights in the theater, in the study, or in the "protracted meeting." It will make no difference; the result to the body will he the same. The sleep was not had, and for that the man must pay.

One man may do with a little less sleep than another; but, as a general rule, if you want a clerk, a lieutenant, a lawyer, a physician, a legislator, a jodge, a president or a pastor, do not trust your interests to any man that does not take eight good eolid houre of sleep out of every 24. Whatever may he his reason for it, if he does not give himself that, he will snap eome time juet when you want him to be strong.

The intellectual and moral connections of sleeping have, I think, not heen sufficiently appreciated. Men and boys have been praised for "burning the midnight oil." Now thie "midnight oil" is a delusion and a snare. The etudent who is fast asleep at 11 o'clock every night, and wide awake every morning at 7 o'clock, is going to surpass another student of the same intellectual ability who goes to hed after 12 and rises before 5. In sleep, the plate on which the picture is to he taken ie receiving ite chemical preparation; and it ie plain that that which is the hest prepared will take the bst picture.

Men who are the fastest asleep when they are asleep, are the widest awake when they are awake.

Great workers must be great resters.

Every man who has clerks in his employ ought to know what their sleeping habits are. The young man who is up till 2, 3 and 4 o'clock in the morning, and must put in his appearance at the bank or store by 9 or 10 o'clock, and work all day, cannot repeat this process many days without a certain shakiness coming into his system, which he will endeavor to steady hy some delusive stimulos. It is in this way that many a young man begins his couree to ruin. He need not necessarily have been in bad company. He has lost his sleep; and losing sleep is losing strength and graces.—*Rev. Dr. Deems.*

The Fresh Air Habit.

Esrly impressions are very enduring, and can make useful habits as well as evil ones n sort of second nature. In order to forestall the chief danger of in-door life, make your children lovesick after fresh air; make them associate the idea of fusty rooms with prison life, punishment and sickness. Open a window whenever they complain of headache or nauses; promise them a woodland excureion as a reward of exceptionally good hehavior. Save your best sweetmeats for ont-door festivals. By the witchery of associated ideas a hoy can come to regard the lonely shade tree as a primsry requisite to the enjoyment of a good story book. "Only the movement of my feet seems to set my brains a-going," ssys Rousseao. And it is just as easy to think, debate, rehearse, etc., walking as sitting; the peripatetic philosophers derived their name from their pedeetrian proclivities, and the Stoic seot from their master's predilection for an open porch. Children who have heen brought up in hygienic homes not rarely "feel as if they were going to be choked" in unventilated rooms, and I would take good care not to cure them of such salotary idiosyncrasies.

Every oheervant teacher must have noticed the innate hardiness of young boys, their unaffected indifferance to wind and weather. They seem to take a delight in braving the extremes of temperature, and, by simply indolging this *penchant* of theirs, children can be made weather-proof to an almost unlimited degree; and in nothing else can they be more safely trusted to the guidance of their protective instincts. Don't he afraid that an active boy will hurt himself by voluntary exposure, unless his chances for out-door play are so rare as to tempt him to abnse the first opportunity. Weather-proof people are almost sickness-proof; a merry hunting excursion to the snow clad highlands will rarely fail to counteract the consequences of repeated surfeits; even girls who have learned to brave the winter storms of our northwestern prairies will afterward laugh at "drafts" and "raw March winds."—*Dr. Felix L. Oswald, in Popular Science Monthly.*

How to Sleep in a Sleeping Car.

To sleep well in a sleeping car:

1. Get a berth in the fore part of the car. This is because the pure air comes in at the front end and windows and goes out at the rear end and windows. General Butler always gets the extreme frontberth. I always take the front opper berth. My reason for taking the upper berth is because it is freely ventilated and away from the hot pipes.

2. Have your herth made op head toward the engine. This will keep all drafts of air from your head and prevent taking cold. If the car is very tight put a lead-pencil nnder the window at your feet in case of lower herth; or, in case of the upper herth, open the hind sky-window at your feet.

3. Fix your pillow in one oorner of the herth and your feet in the other. By laying crosswise you will not roll in your herth.

4. If you are nervous do not drink water, milk, coffee or any liquid substance for three hours before retiring. The reason for this will be ohvious to any one.

External Use of Castor Oil.—The London *Medical Journal* gives reports from various practitioners who have found purgative results to follow the use of castor oil as an external application. One writer states that he has frequently applied this oil to his abdomen, under spongiopiline or water-proof material, in cases where the usual way of administering by mouth seemed undesirable, and with the most satisfactory consequences. In a case of typhoid fever, also, half an ounce of caetor oil was applied in this manner, under a hot water fomentation. The effect of this heing, as represented, to relieve constipation and tympanitic distention that had been present, without undue purgation or any irritation of the bowels.

Toothache.—There should be a remedy for toothache in every house where there are children. The following is reported by medical authority ae reliable: Take of carbolic acid (saturated solution), chloral hydrate (saturated solution), paregoric, fluid extract of aconite—of each one ounce; oil of peppermint, half an onnce; saturate a piece of cotton aud pack tightly in the cavity.

A Dangerous Hypnotic.—It appeare that bromide of potassium, which is so extensively used as an antidote for sleeplessness, is largely composed of lead, and those who employ it are expoeing themselves to lead poisoning. Thie statement is made hy a German chemist.

Passing Events.

As we write, the welcome rain is falling which gladdens the hearts of the people in an assurance of a prosperous year before us. This, our first week of the new year, opens auspiciously, and from all quarters comes news that the people expect a continuance of the Divine favors which have been showered upon us during 1881.

Our only drawback is the unfortunate litigation entailed on the settlement of the debris question. It is greatly to be hoped that it will before long be definitely settled. The question has now been introduced in Congress, so that if the nation takes hold of it, we shall have a solution before long.

The great Gold Run suit still runs along at Sacramento. Very many witnesses are being examined, and the taking of testimony has absorbed much more time than was expected.

The MINING AND SCIENTIFIC PRESS enters upon a new volume to-day, an event worthy of note by all our readers. We are endeavoring to constantly improve the paper and keep it to the front with the progress being made in science, mechanics, mining and kindred interests.

We shall shortly give an exhaustive review of the mining interests for 1881, with such statistics from different localities as we are able to gather.

THE State Fish Commission has received from the East 50,000 Eastern trout and 500,000 whitefish eggs for distribution in the waters of this State. Twenty thousand of the trout eggs are being hatched at San Leandro.

THE London *Times* says the Chileans, who obtained a victory in a just war, will not be inclined to submit to dictation unless the American army and navy are largely reinforced.

A New Volume.

This is the initial number of Volume XLIV. of the MINING AND SCIENTIFIC PRESS.

We have earnestly endeavored during the past year to make as interesting and valuable a paper to miners, mechanics and other industrial readers as possible, and flatter ourselves that we have been successful.

The PRESS has now attained a ripe age, and its usefulness has increased with its years. No miner or manufacturer can afford to be without the representative industrial publication of the Pacific coast.

The coming 12 months promise greater development in the mineral progress of the coast than has been experienced in any past year. There has been a great revival of the mining industry, and the area over which it is carried on is greatly widened. No one interested can afford to do without a journal which represents so great and growing an industry. Manufactures and mechanic arts are also gaining a better foothold among us; and to these we devote considerable space.

We shall still continue to gather information from all reliable sources such as will be interesting to our readers, and endeavor to make our paper as practically useful to its progressive readers as possible.

Of course, to be able to carry on a journal like this we need the encouragement and support of the industrial classes in the community. We want old subscribers to renew their subscriptions and new readers to send in their names. Our old subscribers can help us greatly by bringing to the attention of others the merits of the PRESS. In doing this they benefit themselves also, since with increased patronage increased expenditures may be made on the paper. The beginning of a volume is a good time to begin being a subscriber; tell your friends that and encourage them to help us.

We wish our many subscribers and advertisers a Happy New Year, and hope that the coming twelve months will treat them so well they will all be with us at the commencement of 1883.

Mining Partners.

The law provides that upon the failure of any one of several co-owners of a vein, lode or ledge which has not been entered for patent, to contribute his proportion of the expenditures necessary to hold the claim or claims so held in ownership in common, the co-owners who have performed the labor, or made the improvements as required by law, may, at the expiration of the year, give such delinquent co-owner personal notice in writing, or notice by publication in the newspaper published nearest the claim, for at least once a week for 90 days; and if, upon the expiration of 90 days after such notice in writing, or upon the expiration of 180 days after the first newspaper publication of notice, the delinquent shall have failed to contribute his proportion to meet the expenditures or improvements, his interest in the claim by law passes to his co-owners who have made the expenditures or improvements.

The following forms are those which will be the proper ones to use in such cases:

Notice of Forfeiture.

———County, ——— ———, 188—.

To—(names of all parties who have record title to any portion of the mine). You are hereby notified that I have expended———dollars in labor and improvements upon the ———lode (dike or the claim), as will appear by certificate filed———, 188—, in the office of the Recorder of said county (or district), in order to hold said premises under the provisions of section 2324 Revised Statutes of the United States, being the amount required to hold the same for the year ending———, 188—. And if within ninety days from the service of this notice (or within ninety days after this notice by publication), you fail or refuse to contribute your proportion of such expenditure as a co-owner, your interest in said claim will become the property of the subscriber under said section 2324.

(Signature).

NOTE.—At the expiration of 180 days, this notice should be recorded with the affidavit of the newspaper publisher, that the same was published for the period of ninety days, together with the affidavit (Form 4) of the party signing the notice to the effect that one or more of the co-owners named in the published notice have not paid their share of the expenditure. This completes the record title.

Affidavit of Failure to Contribute.

———of———, *County of* ———, *ss.*

———, being duly sworn, deposes and says, that for the year ending———, 188—, he expended at least ——— dollars in labor and improvements upon the ——— lode [or ——— placer claim] (here describe the claim), to hold the same under the laws of the United States and of this——— (district, Territory or State); that due notice thereof was personally served upon ———, co-owners, on the ——— day of———, 188—, (or was duly published in the ———, as appears from the affidavit of the publisher thereof); and that ——— ——— (of the said) co-owners have failed or refused to contribute their share of said expenditures within the time required by law.

———

Subscribed and sworn to before me this———day of———, 188—.

———

The party who contributes his proportion of the *required* expenditures, can retain his interest in the mine. If a party fails to contribute his proportion of the *actual* expenditures upon a mining claim, the remedy must be sought elsewhere than in the General Land Office.

Drift Mining.

Drift mining, next to hydraulic mining, is the most important branch of placer mining at present followed in California. In fact, it is almost the only branch, comparatively a small amount of river-bed mining in northern California being done, and the primitive methods of argonautic days—the pan, rocker and ground sluice—are now relegated to the Chinese, washing over old tailings, or to the working during the spring of the small areas of untouched surface diggings.

Drift mining is the term used among miners to define and describe that variety of placer mining in which only a comparatively small portion of the gravels or "wash"—that portion containing most gold in proportion to its bulk—is removed by what is technically known as *drifting*, from underneath worthless or comparatively barren ground, and brought to the surface. There this gravel is washed, either directly through sluices and the gold caught in the riffles, or where it is hard and cemented, it is crushed in stamp batteries and treated exactly as free-milling auriferous quartz. The underground work is very similar to that of coal mines, as distinguished from the working of metalliferous vein deposits of any kind.

Drift mining works under more natural disadvantages, which will further on be particularly noticed, than hydraulic mining, and the cost of opening and fitting a drift claim often reaches a very high figure. Laboring under the disadvantages it does, it would not be followed to any extent were it not that there exists a certain class of gravel deposits which, from their location and the amount and position of the gold in them, cannot be worked successfully by any other method. By drifting, from a well-opened, good mine, a profit commensurate with the risk can be obtained. As a pre-requisite to a thorough knowledge of drift mining, is essential a comprehensive understanding of the phenomena and peculiarities of the gold-bearing

Gravel Deposits.

These may be considered of two general classes, in origin, primary and secondary. The latter, the less so in importance, consists of the bare and channel deposits of the present streams and were almost entirely worked out years since. The shallower and more accessible beds were worked from the surface down to the bedrock by the usual methods. From the deeper and less accessible deposits only the richest portion of the gravel, that lying on or immediately above the bedrock, was taken out by drifting and worked. These gravels are usually loose, or very slightly cemented, and were consequently easily worked.

As distinguished from the preceding, the great body of gold-bearing gravel of this State consists of the ancient river channel "wash" of pliocene times, now for the most part buried deep down under volcanic ashes, and trachytic and basaltic lavas. The causes leading to the formation of these old river channels, their filling up first with drift and gravels carrying gold, sands and clays, then their final obliteration and covering up with lavas and other volcanic detritus, and the subsequent formation of the present river system, it is not necessary to consider here. The present streams cross the old channels usually at a sharp angle, the latter having generally a somewhat more southern course, though this is not by any means universally the case. Again, the present streams have eroded through the lava and drift, and far into the underlying country rock, deriving the greater portion of the gold in their gravels from the older channels, where they have been cut through and washed away. Occasionally we find one of the existing rivers flowing over the drift-filled bed of a pliocene river, as, for example, the Feather river at Oroville, in Butte county. In general, however, the old channels are higher than the present, and the difference in elevation increases as the summit of the Sierras is approached. A consideration of the above and the physical geography of the placer mining region of California shows the present rivers flowing in deep canyons and between mountain spurs or ridges, locally known as "divides," and in these "divides," oftenest far above the rivers, the discontinuous fragments of the old channels, sometimes almost parallel to the present rivers, but usually crossing diagonally from canyon to canyon. The thickness of these gravel beds varies from a few feet, or even inches, to several hundred feet, and as regards width, the extremes are even further apart, in fact, hardly determined, as the auriferous drift gravel sometimes covers the whole surface of the country for miles, with no well-defined channel limits. Great variations exist in the hardness of the superincumbent lava, where it occurs, the gravel and the underlying country rock. The gold found in these channels varies from the finest flour-like fineness, requiring undercurrents and quicksilver to save even in part, up to masses so large that they sometimes run into the tailings and are lost, the riffles in the sluices failing to hold them. The gold is, however, almost invariably most concentrated in the gravel lying immediately on the bedrock.

Conditions of Drifting.

Where the conditions are favorable, that is, where the gravel deposit is deep and extensive, and the gold more or less disseminated through it, where a sufficient head of water for washing, and fall or dump enough to carry off the tailings can be had, hydraulicing is the method of working employed. The presence of a lava cap, pips clay strata or a hard and cemented variety of gravel resisting the slacking action of water and air, even after partial disintegration by bank blasting, render unprofitable the hydraulicing of some of these deep channel deposits. Many of the present hydraulic mines were first worked by drifting, and in many instances yielded a larger profit then than now. By far the greater portion of these channel gravels are shallow and buried under several hundred feet of lava, and can therefore only be worked by drifting. The old streams, like the present, had bars and eddies, rapids and falls, and the same peculiarities in the distribution of the gold in their gravels and sands is observable. Both have barren stretches, and pockets, leads and crevices of extreme richness, only in the present streams these latter are found from external indications without much difficulty; in the buried streams they are sought for almost blindfold, the most experienced practical miners being often at fault.

The conditions of drift mining ground may be briefly stated as follows: A divide between two deep river canyons, the sides cut into by small ravines tributary to the main streams, the top sometimes several miles wide, mesa-like and comparatively level, and having only one main slope in the direction of the ancient buried rivers. This top is usually composed of lava several hundred feet thick, and somewhere underneath this lava cap and between walls of true country rock termed the "rims," the channel of an ancient river, sometimes with little or no gravel in its bed, sometimes with gravel two or three hundred feet thick; sometimes barren of gold, but more frequently found to be wonderfully rich in that metal. Under all of the above, granites, metamorphic slates, limestones, sandstones, serpentines and talcose rocks. The problem of drift mining is to find the position of these channels, to open up and to prospect them with the least possible expenditure, and, if a lead of pay gravel is found, to work it at the least possible cost.

(TO BE CONTINUED.)

The Ward Propeller.

It may be remembered by our readers that a year or more ago we gave some account of preliminary trials on a steam launch on Lake Chabot, and small tug in this bay, of the peculiar propeller designed by Mr. John B. Ward, of this city. The results of the trials referred to were so satisfactory to the inventor, that he determined to continue them still further with more carefully taken data, in order to settle convincingly the superiority of the wheel. Accordingly, he went East last summer, where he would have an opportunity to put the wheel in competition with those of best design, and on boats where speed was a prime object; all the small steamers in this bay being designed for towing purposes only.

Mr. Ward employs for his propeller peculiarly-formed elastic blades united to the hub, upon which are formed flanges upon the arc of a circle, so as to give the greatest strength at this point. These blades are formed circular, but are with a straight-line face, and of a substance of an elastic nature, the outer edge being in the arc of a circle, so as to increase the efficiency of the blade. The hub is cast or wrought, and the blades are secured in the slots on the flanges on this hub by suitable bolts, but in a peculiarly strong manner. The flanges on the hub are turned to the pitch required for the blade. The blades are formed of elastic steel, without any curves or hollows, a perfectly flat surface being presented to the water.

The form and proportions adopted by Mr. Ward give the maximum strength with minimum weight, and the maximum effective straight-line-face area of blade thrust, with the necessary strength of flange and grips. The elastic blades may be removed and interchanged readily, and a great deal of the jar on engine and machinery is avoided.

Mr. Ward's theory on this subject is about as follows: "The curved-line propeller blade, in ordinary use, breaks the head of the resisting water column, throwing it into foam and producing slip. The straight-line-faced elastic propeller makes a clean cut on the head of the resisting water column, and produces no foam. The reaction of the water column on the wheel is instantaneous, continuous and effective, the propeller blade receiving the reactive effect of the resisting water column on the same surface that gave the original thrust; hence there is no slip, but, on the contrary, the reactive effect of the elastic blade, when its modulus of elasticity if properly adjusted in reference to the resistance to be overcome, will cause the vessel to overrun the distance usually allowed to the pitch of the propeller. As a wheel is a continuous lever, so is this propeller a continuous even wedge or inclined plane, giving great efficiency."

Mr. Ward had, when he first went East, some difficulty in obtaining exactly the kind of craft on which to try his wheel. He finally heard of the steamer *General Franklin*, which had been built by Handren & Robbins for Mr. Darkin, agent of the Colts Arms Co., of Hartford, the boat being named after the President of that company. She has what is known as the disk engine, a newly devised type, which is particularly adapted for propellers, being a rotary one. The boat is 48½ ft. over all, 8½ ft.

beam, and drawe 3½ ft. of water aft with the skag. Her performances as to speed have surpassed those of any boat around New York, taking into account her ability and stability. A Ward propeller was made and put on her and while on her she was sent off somewhere, and unluckily got on a reef. The propeller wheel was knocked against the rocks and considerably battered and bent but not broken. She was hacked off with it finally, and the wheel really saved her, for an ordinary cast one would have been broken. Her old wheel was put in again next day while the Ward one was being repaired. In starting out away from the battery, the cast wheel just touched the stone steps, and away went one of the blades.

After this experience, Mr. Ward made further trials with his wheel and it is on the boat now. With it she backs as well as she goes ahead and steers very straight. In an hour's run with the same steam pressure, the log showed nine-tenths of a mile greater velocity than with the Delamater wheel, and an economy of coal of 25%. The Delamater propeller is recognized as the best speed propeller in the United States, Mr. Ward tells us. It is the invention of Ericsson. It is the perfection of the curved-line-face wheel, but it backs badly.

The following report contains the memoranda and trials of the Ward propellor, in competition with the Ericcson (better known as the Delamater) propeller, in New York bay and on the Hudson river, in August, November and December, 1881, on the steam launch *Gen. W. B. Franklin:*

One trial was made with a 32 inch, two-bladed wheel over a 12-mile course. In this, Mr. Dickie, of the Albany Iron Works, designer of the launch, reported that the Ward wheel sent the boat over the course in about the same time, with an economy of about 20% of fuel.

The other trials were made with the greatest care, using Bliss & Co.'s patent log; the coal was carefully weighed, and an even pressure of steam at 120 lbs., by the gauge, maintained. The course was over the Hudson, along the Jersey side from Fort Lee wharf to the Piermont wharf, distant 14 miles, and return. Capt. Freeman, master of the yacht, attended to the log himself, and signed a certificate to the following effect:

"On November 26th the boat ran, with a 35-inch three-bladed Delamatar wheel, 25⅞ miles in 3 hours 17 minutes, burning 300 pounds of coal; steam pressure, 120 pounds. At the time there was a flood tide and strong SW. breeze."

"December 17th the boat ran, with a 34-inch three-bladed Ward propeller, 29⅞ miles in 3 hours 44 minutes, burning 280 pounds of coal, with 120 pounds pressure. This trip was made on a strong ebb tide, stiff breeze ahead and heavy swell, causing the wheel to 'race' considerably."

"There were various trials, but these were the principal ones. The result shows an economy of over 25% of fuel, greater speed, less vibration, much superiority for backing, steering and stopping in favor of the Ward wheel."

Inventors and Progress.

One who signs himself "Inventor," writes in answer to some strictures passed upon inventors by a Stockton paper, claiming that inventors are idle, designing persons, who are always endeavoring to live without work, always looking for the opportunity to entrap some unwary capitalist into investing money in their inventions. Such remarks applied to the inventors in general is a base, ungrateful slander. One has only to look into the present working of any department of the arts or manufactures to learn the service of invention to industry. Every item of progress, from the rude processes and appliances of the ancients, has been the work of the inventor. As a rule, the improvements have cost a great amount of experiment and effort and actual outlay to those who have achieved them. There is, of course, now and then, a happy thought; but the average of effort for each invention is very great. It is but natural that the successful laborer in the field of invention should desire to enjoy a part of the fruits of his labor, and the people of the United States and other civilized countries, have decided that his claim is a just one. What would farming be without the triumphs of the inventor? Contrast the labor it is now possible to accomplish by one man's labor with what was done by a man in the early days. Contrast the gang plow with the forked stick, the self-binding reaper with the sickle, the thrashing outfit with the flail. People who decry the service of the inventor to the industries are relics of a bygone age. They have no part or parcel in the progress of the day. Agriculture has enjoyed her full share of the inventors' attention, and while she has been advanced, they, in turn, or many of them, have become enriched. It is a case of useful labor well requited; and there is much more of it to do. Excellent as are our agricultural tools and machines, no one can tell what farther improvement may come to them through the inventor's earnest efforts.

PERSONS who have visited the mines at Highland speak in glowing terms of the outlook of that place. A number of the prospects are looking very promising, having well defined ledges of good ore. It is likely that there will be another town built up at Highland next spring.

Ancient Mining.

Probably in no branch of any long-established industry have there been such marked advances in the appliances in use as, in the past quarter of a century, in the mining industry. The main improvements have been in hoisting and pumping machinery; and in the latter, particularly, every possible device for cheapening cost has been introduced. It is interesting to look back to see what used to be done to relieve mines of water, and what systems are even yet in vogue in countries where time and labor are of little moment. The following from the Arizona *Star*, taken in connection with the engraving we present, will be of interest:

The methods in vogue among the ancients for the development of mines were in many respects far different from those in use at the present time. In the country to the south of us, the descent and ascent of shafts were made by means of notched logs. These were from 20 to 30 ft. long, extending from level to level. The logs or ladders were climbed by the sure-footed miners, the Aztecs, and more recently by the Indians, who were engaged in the dislodgment of the precious mineral. The ore was placed in rawhide bags containing about half a bushel,

ANCIENT METHOD OF TAKING WATER FROM MINES.

this same being rested upon the back, while it was held in position by straps extending across the shoulders, united in front, and fastened through its own weight upon the forehead.

If a mine were overflowing with water, the troublesome fluid was removed in these bags, in the same manner as the ore, by the miners, who tediously climbed the notched poles, and whose notches answered the place of wider steps. The ore was removed in a manner almost as tedious. Fires were built against the walls of the mine, and as their surface became calcined, the incinerated portions were dislodged by stone hammers. The melting was equally as cumbersome, being effected with charcoal and bellows. Yet mining was profitable under these crude methods. It is not surprising, therefore, that wonderful reports continue to reach us of the richness of the abandoned old mines of Sonora, which, with the introduction of modern machinery, worked by energetic and experienced Americans, will soon astonish the world with their rich productions.

In the early days of the Comstock, we have seen these notched poles in use in the Mexican mines in this city; also the rawhide sacks. However, they used picks and shovels, and blasted out the ore instead of burning it out. The ore was worked in plastras, and by the patio process—indeed the patio process was in use here for years, and not alone by Mexicans. Horses were used for treading these patios to stir up the pulp, and in a short time the poor beasts presented a pitiable appearance. The bluestone in the pulp took all the hair off their legs and covered them with sores, while the quicksilver salivated and poisoned. It was said that the horses became so charged with mercury that it oozed from their eyes,

Technical Education.

In the course of some remarks at the last meeting of the California Academy of Sciences, the President, Prof. Davidson, made a few suggestions upon the introduction of elementary science in our public school system, and upon the formation of schools of trade, art and commerce. The professor believed that the present school system has spoiled tens of thousands of artisans; but it has, in a measure, only repeated the experience of other countries. To state its results mildly, it may be said to create a disposition in the pupils to avoid those occupations which demand manual labor, and to seek those easy berths, where some one else must do the work. It creates a false standard of manly merit. It causes a multitude of incongruous subjects, and lacks completeness and thoroughness in any one of them. Whoever has had a varied experience with young men grown up from the ordinary public schools, will be astonished at their lack of knowledge of the fundamental principles which underlie their workmanship. They have, in general, an amount of undigested, incoherent material, which their teachers have christened knowledge, and which their experience considers applicable for any sin every pursuit. For example, one of the commonest wants of pupils throughout the country is their inability to draw upon paper any plan of roads with which they are familiar, any sketch of the plainest machine of the day, and much less to convey upon paper any idea which looks to an improvement or an invention in machinery or construction.

Professor Davidson felt safe in saying, from his experience, that not one person in a hundred from our public schools can give you an off-hand drawing of any plain object with an approachable degree of accuracy as to relative dimensions or perspective. This he did not think was the fault of the pupils, who, as a rule, are naturally quicker and brighter than the youth of Europe, but it is the inherent weakness of the system—an evidence that we are not doing our duty to our boys. These deficiencies in the present system can be corrected only in a measure, because time is required to mold and develop the proper system of trade and art schools, of evening and navagation schools suitable for this side of the continent, at least; whilst we can certainly at once engraft upon our methods the proper study of elementary science, and especially connected therewith the freehand drawing which is the *sine qua non* in every school of the active nations of Europe. For our young who are to build up the industrial supremacy of this country, we need not cram them with foreign languages, which in few years must be pressed aside before the irresistible progress of the English-speaking races; and it is a thousand times better that the boy, who is to honestly earn his livelihood as an artisan, shall be a fair draughtsman than a fair fiddler. If his special talents point to music, than let that faculty be thoroughly cultivated, but do not waste means in spoiling a good carpenter or in endeavoring to misdirect special aptitude. The classics, music and the fine arts have their high places and their humanizing functions in modern civilization. So has the bridge-builder, the miner, the engineer and the contractor. Life is too short for us to repair the errors of early education. The State loses by the misapplication of talent. We need not willfully throw our wealth into the depths of the Pacific. There are many important conditions attached to this subject of science-teaching and of trade and art schools, especially when we contemplate how extensively great corporate bodies are gathering into their hands the manufacturing processes of the country, and apparently swallowing up individual efforts. But each year the demand for skilled labor increases, and we must meet the difficulties of the problem as the number of factories increase.

Academy of Sciences.

Annual Meeting and Election.

The annual meeting of the California Academy of Sciences was held on Monday evening last, President Davidson in the chair.

The following were elected members of the Society: Life members—W. S. Wood, Edgar Mills, J. D. Fry and Squire P. Dewey. Resident members—C. Mitchell Grant, Ignatius E. Thayer, John Dolbeer, Isador Cohn, A. Crawford, George M. Josselyn, William R. Bentley, Augustus G. Elliott and Hypolite Dutard. Honorary members—Prof. F. V. Hayden and Major J. W. Powell, United States Geological Survey. John G. Harding was proposed for membership. The Council of the Academy presented the name of Charles Crocker for life membership in return for his generous gift and services rendered to the Academy. The proposition was received with applause and the election was unanimous.

The judges of election, who had been busily engaged all day, read their report. It showed that all the old officers and trustees were re-elected to serve during the present year. They are: President, George Davidson; Vice President, Justin P. Moore; Second Vice President, H. Herman Behr; Corresponding Secretary, Samuel B. Christy; Recording Secretary, Charles G. Yale (of the MINING AND SCIENTIFIC PRESS); Treasurer, Elisha Brooks; Librarian, Carlos Troyer; Director of Museum, W. G. W. Harford; Trustees—B. B. Redding, Thomas M. Madden, George E. Gray, James M. McDonald, Ralph C. Harrison, Wm. Ashburner, Robert E. C. Stearns.

The property of the Academy consists of its library and museum, a lot on Market street near Fourth street, a lot, corner of First avenue and Mears street, also a half interest as residuary legatee in the estate of James Lick. The "Crocker Scientific Investigation Fund," is invested in registered Southern Pacific Railroad 6% bonds with interest payable half yearly.

Mr. Redding stated that the Trustees desired to express their thanks publicly to Mr. Charles Wolcott Brooks, the Secretary of the Trustees, for the gratuitous work performed by him in their behalf.

W. G. W. Harford, Director of the Museum, read his report, showing the annual expenses of the Museum to be about $2,889.13

Carlos Troyer then read the Librarian's report, showing 388 valuable works received from individuals, home and foreign societies.

Elisha Brooks read the Treasurer's report, showing $91.07 cash on hand.

Mr. Yale, the Recording Secretary, reported that during the year 10 life and 21 resident members were elected, 19 members were dropped for non-payment of dues, leaving 179 resident and 105 life members in good standing—total, 284. The gain during the year was 12. Twenty-three regular and two special meetings had been held.

Mr. Yale, as Secretary of the Council, read a report from that body, deploring the fact that the publications were not being continued, owing to a lack of funds. The following memorial to Congress was also offered by the Council for adoption by the Academy, and, on vote, it was adopted.

"*Memorial to the Honorable Senate and House of Representatives, in Congress Assembled:* The California Academy of Sciences of San Francisco respectfully represents to your honorable bodies that the varied resources of Alaska which should form an important factor in the commerce of the Pacific coast, are at present unavailable, owing to the want of accurate information regarding the navigable waters and the topography of that region. That the partial surveys heretofore made at intervals by the United States Coast and Geodetic Survey have been so limited as to result in far less benefit to trade than is desired by our merchants and mariners. This Academy, therefore, earnestly requests your honorable bodies to appropriate such funds for the continuance of the United States Coast and Geodetic Survey within the Territory of Alaska as are asked for by the Superintendent."

The President read his annual address, in which he spoke freely of the necessity of the introduction into our school system of branches of elementary science. We will shortly give this paper in full.

Dr. Harkness made some remarks on microscopic fungi, exhibiting specimens under the microscope.

PACIFIC MACHINERY DEPOT.

The Korting's Injector is the simplest, cheapest and best in use. Will draft its own water, hot or cold, and feed under varying pressure. Send for Circular.

H. P. GREGORY & CO.,

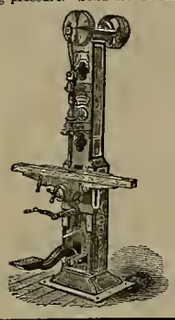
Importers and Dealers in Machinery and Supplies.

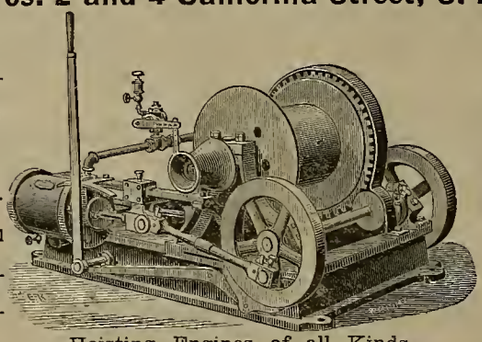
Nos. 2 and 4 California Street, S. F.

BLAKE STEAM PUMP.
More Than 16,000 in Use.

SOLE AGENTS FOR.

- Fay & Co., Wood Working Machinery.
- Bement & Son's Machinists Tools.
- Blake's Steam Pumps.
- Perry's Centrifugal Pumps.
- Gould's Hand & Power Pumps.
- Perrin's Band Saw Blades.
- Payne's Vertical and Horizontal Steam Engines.
- Williamson Bros. Hoisting Engines.
- New Haven Machine Co.'s Machinists' Tools.
- Otto Silent Gae Engines.

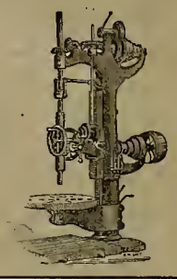




Hoisting Engines of all Kinds.

SOLE AGENTS FOR.

- Stnrtevant'e Blowers and Exhausts.
- Judeon's Steam Governors.
- Pickering's Steam Governors.
- Tanite Co. Emery Wheels.
- Nathan & Dreyfus' Oilers.
- Korting's Injectore and Ejectors.
- Disston'e Circnlar Saws.
- New York Belting & Packing Co.'s Rubber Belting, Hose, Packing, etc.
- Ballard's Oak Tanned Leather Belting.



A. S. HALLIDIE,

6 California Street,

—o—

WIRE ROPES AND CABLES,

Manufactured at my works, guaranteed to be equal in quality to any made, and as cheap, for

MINING AND SHIPPING PURPOSES, ETC.

Wire Suspension Bridges and Aqueducts.

WIRE TRAMWAYS — WIRE ROPE — FLAT AND ROUND — WIRE — GALVANIZED & PLAIN — CABLE RAILWAYS

A. S. HALLIDIE,

San Francisco, Cal.

—o—

WIRE OF ALL KINDS,

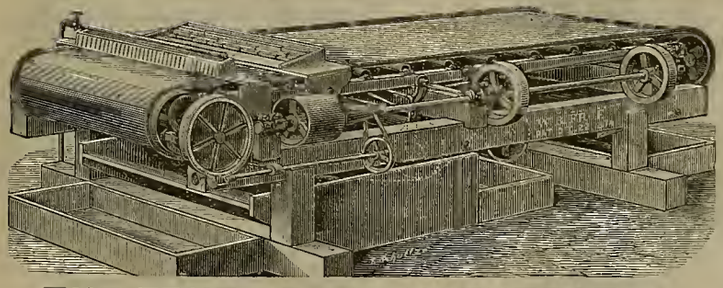
Manufactured at my Wire Mills in this city, superior to any imported, for

Telegraph, Bailing and Fencing, etc.

WIRE STAPLES AND WIRE NAILS.

Wholesale and for Export.

$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR.

Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.

Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.

We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.

☞A machine with all improvements can be seen in working order and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont street.

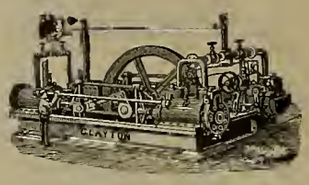
ADAMS & CARTER, Agents, Room 7 No. 109 California Street, S. F.

CLAYTON AIR COMPRESSORS,

—AND—

INGERSOLL ROCK DRILLS.

INGERSOLL ROCK DRILL.



CLAYTON AIR COMPRESSOR.

Having been appointed Sole Agent for this Compressor, I will keep a full stock of the different sizes in store. Prices much less than any First-class Compressor in the market. ☞SEND FOR CATALOGUE.☜

GEORGE R. FOARD, 18 First Street, S. F.

Sole Agent for the Ingersoll Rock Drill and Clayton Compressor Co.

GIANT POWDER

MANUFACTURED UNDER A. NOBEL'S ORIGINAL AND ONLY VALID NITRO-GLYCERINE PATENTS.

Nos. ONE, TWO and THREE.

Stronger, Better and Safer than any other High Explosive

Judson Powder

IS NOW USED IN ALL LARGE HYDRAULIC CLAIMS.

It breaks more ground, pulverizes it better, saves time and money, and is superseding the ordinary powder wherever it is tried. ☞Triple Force Caps and all Grades of Fuse.

BANDMANN, NIELSEN & CO.,

SAN FRANCISCO, CAL.

TUSTIN'S ROTARY PULVERIZING MILL.

WORKS ORE WET OR DRY,

And Feeds Itself Automatically.

Patented October 11, 1881.

One of these machines can be seen at the Ore Sampling and Pulverizing works of Hofmann Bros., No 415 Mission St., where it is working every day. Weight 5,000 lbs., heaviest piece 480 lbs.

Manufactured at the

TUSTIN WINDMILL, HORSE POWER AND PUMPING MACHINE WORKS.

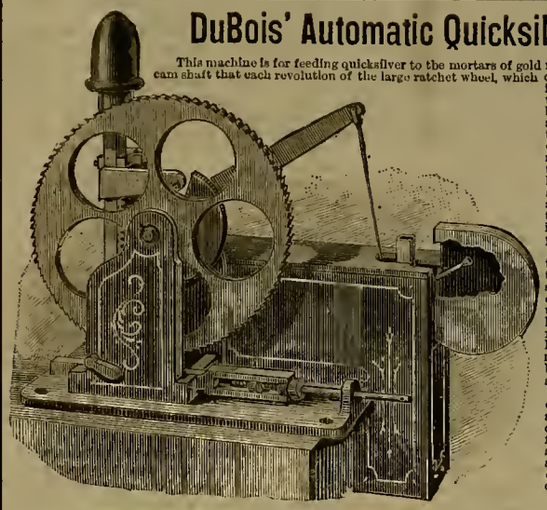
Lap-Welded Pipe, all Sizes, from Three to Six Inches. Artesian Well Pipe. Also, Galvanized Iron Boilers, from 25 to 100 Gallons.
Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools supplied for making Pipes. Estimates given when required. Are prepared for coating all size of Pipes with a composition of Coal Tar and Asphaltum.

Office and Manufactory, 130 Beale Street, San Francisco.

SHEET IRON PIPE.

DuBois' Automatic Quicksilver Feeder.



This machine is for feeding quicksilver to the mortars of gold mills. It is so connected to the cam shaft that each revolution of the large ratchet wheel, which can be regulated to revolve once in one, two, three or four minutes, as desired, dips a small cup into a reservoir of quicksilver, and by a trip of the cam, empties the contents into a pipe leading down to the mortar, supplying an exact quantity at regular intervals, superseding the ordinary hand feeding, which is of necessity subject to great irregularity, and liable to neglect. It renders the amalgamation of all the gold in the pulp equally certain and perfect.
The mechanism to produce this depression and elevation of the cup, is driven by the cam shaft, similarly to the self-feeders, over which so much ingenuity has been expended to regulate the delivery of ore to the mortar. As it is to be desired to have the ore go in constantly and regularly, so it is equally desirable to have the mercury fed constantly and regularly.
A chief point of excellence of this machine is, that it allows the quantity of mercury which would be otherwise fed in mass, in one hour, to be subdivided into a number of small portions, and fed almost continuously; *i. e.*, from every one to four minutes.

Price, complete, $100.

For Sale by } **WHITNEY & MARSHALL,** { Sole Agents

22 & 24 Fremont St., San Francisco.

Dealers in Iron, Steel, Hardware and Mining Supplies, Wrought Iron Pipe and Fittings, Pump Columns, Wire Rope, etc. A large stock of Boiler, Plate and Sheet Iron of every description.

MOREY & SPERRY,
MANUFACTURERS OF
Gold and Silver Grinding and Amalgamating Machinery

HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.

It weighs complete, 7,000 pounds It costs $1,500 ready for the belt Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.

Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver ores Chloridizing Furnaces, Retorts, Rock Drills Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies Iron Work complete for Wood Frames, also

SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.

☞ Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

Notices of Recent Patents.

Among ths patsnts recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

RAILWAY TRACK GAUGE AND LEVEL.—Chas. F. Bergh, Alma, Santa Clara county, assignor of one-half to Lysander Collins, same placs. No. 250,777. Dated Dec. 13, 1881. This track gauge and level consists in a novel arrangemsnt of parts, whereby an instrument is made which will accomplish the object intended with ease and accuracy. The stock has shoulders by which it rests, and fite between the rails. The top of the stock is cut out to form a recess, in which is a har, pivoted at ons end, and carrying an ordinary levsl. Ths free end of ths har is provided with a rack, with which a pinion on the end of a thumb-screw engages, so ths har may bs raised or lowered about its pivoted end. This means of adjusting the bar and spirit level is much hetter than the set-scrsw method. On the sides of ths har are gradnated scales. When the track is straight, the level in the bar will level it. When the track is to be curved, the degree heing first determined upon hy ths direction or curve of the road, the object then to determine is, how much one rail is to bs raised above another. It is a matter of calculation, that when a curve of a certain degres is made, one rail should bs raised above another a certain distance. The scale of dsgrees and scale of inches on the swinging bar are made to correspond, so that when a certain degree appears above the edge of the stock when the har is raised, a certain inch line will also appear, and that line is the exact distance the rail must be raised when a curve of this degrse is to be made on ths track. As hefors said, the graduated scales upon ths end of the bar and the correspondence are derived by calculation, and the object in having both the scales of dsgrees and of inches upon ths bar is, that the trackmen may see about how much to raise the rail without having to consult the tables of calcnlation. Knowing the degres of curvature to he made, they have hut to raiss the swinging bar so that the degres shall appear upon the scale, when the inches, which are made to correspond, will also appear, and they can see at a glance how much to raise a rail. If the roadbed requires a very short cnrve to be made, the rails reqnire to be separated a little more than in the case of a long curvs. A sliding bar e fixed in the gauge to account for this.

EGG AND FRUIT CARRIER.—J. J. McIntyrs, Oakland. Dated Dec. 27, 1881. No. 251,617. This is an improvement in cases designed for transporting eggs, fruit, or othsr similar articles; and it consists in a novel msthod of cutting, uniting and locking the strips which form the compartments that contain and separate the eggs, and that are placed in tiers one above the other in suitable cases, each tier having a loose hottom or diaphragm interposed between it and the next set of compartments. Many forms of compartment cases have heen constructed, most of which have one or both of the sets of transverse atrips notched upon the edges, and as these strips are usually made of pasteboard for economy, these cut edges are easily folded down or destroyed by handling and breaking of eggs. This invention contemplates the use of two sets of strips, those running in one direction having slots extending transversely across the center, but not extending to the edges. The other set of strips are sufficiently wide to just pass through and fill these slots, and they have small central slots just where they meet the other set of strips, through which a narrow atrip of material passes, alternately to one eide and the other of the first-mentioned strips, so as to form a lock.

PORTABLE COVERED HAMMOCK AND FRAME.—N. Vizelich, Stockton. Dated, Dec. 27, 1881. No. 251,488. This invention relates to a portable hammock adapted to receive a cover, and to the frame for awinging said hammock, the object of the invention being to provide a ready, convenient and secure place to lie down, when necessary. The iuvention consists in the arraugement and combination of certain props, supports and braces, which may be easily set up and taken down, and in a hammock adapted to he suspended from the frame thus made, said hammock heing provided with head and foot stretchers and curved bars, upon which is laid and supported a covering, whereby protection is afforded to the occupant, and the whole device heing adapted, when taken down, to he rolled up together, the hammock forming the casing or sack, and etrapped into a small compass, so that it may he transported with ease from place to place, aa necessity requires.

RAILROAD SWITCH.—Marius R. Dahlgren, Oakland. Dated Dec. 27, 1881. No. 251,417. Thie improvement on railroad switches consists in a novel combination of apparatus which is connected with the switch-rail to be moved, and has extensions in each direction, with crank-arms or disks. These arms are so placed that devicea carried upon the locomotive may be thrown out so as to strike either one or the other, and thus throw the awitch-rail in either direction desired, and when approaching the switch from either direction or upon either hand.

GAG RUNNER.—William M. Blaine, Salinas. Dated Dec. 20, 1881, No. 251,021. This invention relates to an improvement in gag runners for bridle, and espscially to ths constrnction of a cantral bridge or support for the loop, and from the under sids of which a spire projects for adjusting the gag rnnner. It consists of an opsn elongated frame, with a central transverse piece or bridge, from which the loop sxtends, being made a part thereof, whereby strength is gained. Two openings are thue formed in the frame or clamp through which the strap passes, and by which it can he slippsd up and down. From the underside of the transvsrss piece or bridge forming the bass of the loop, a spnr projects to fit the holes in ths straps, whereby the gag runner is made adjustahle. The object of ths invsntion is to provide a gag runner, which will combine strength, durahility and simplicity, and at ths same time he adjustable whereby the check can be rsgnlated

ROLLER DEVICE FOR SEAMS OF TIN ROOFS.—Chas. D. Morin, Woodland, Yolo Co., Cal. No. 250,446. Dated Dec. 13, 1881. This is a machine or roller device for rolling and flattening out the seams on tin roofs of honses. It consists of a heavy roller, journaled in a frame having a handle, in combination with a brake for eaid roller, and an upper or supplementary frame, on which additional weight may bs placed whsn necessary. The object of the inventor is to provide a device which will save labor and flatten out the ssams regularly and easily, thus preparing them for the bstter rsception of ths solder. It therefore has application merely to such seams as reqnirs to be flattened and is not for making and rolling upright seams on tin roofs.

FOOTSTOOLS FOR ROCKING CHAIRS.—F. Franz, S. F. Dated Dsc. 20, 1881. No. 251,034. The invention consists in a flat board or foot rest, under which is journaled a roller, and to which is attached a wire or rod, the other end of which ie fitted to and is adapted to move back and forth upon a guide board under the chair. The feet rest upon the board and by the motion of the chair, said board is rolled back and forth.

FURNACE.—Henry R. Taylor, S. F. Dated Dec. 27, 1881. No. 251,485. This invention relates to the class of cupelling and melting assay furnaces. It consists in certain details of construction, whereby the inventor is enabled to make a furnacs that will be strong and firm without the employment of circumscribing sheet-iron cylinder or bands of strap iron.

Pacific Coast Weather for the Week.

[Furnished for publication in the PRESS by NELSON GEROM, Sergt. Signal Service Corps, U. S. A.]

The following is a summary of the rainfall for each day of the week ending Wednesday, Jan. 4th, at noon, for the stations named:

Date.	Olympia.	Portland.	Roseburg	Red Bluff	Sacram'to	San Francisco	Visalia.	Los Angeles.	San Diego.
Thursday, 29th	*.07	.02	.00	.01	.03	.00	.00	.00	.00

*Sixteen hours missing from Olympia, and 8 hours from Portland, Roseburg and Red Bluff during week. Reports missing from north of Red Bluff this P. M.

A FEARFUL calamity occurred at Shanesville, O., last Satnrday night. It resulted in the loss of several lives, and aeriona injnry to nearly 100 victims. A floor gave way with a terrible crash, precipitating 300 people to the first floor. The red-hot atove fell with the crowd, and the oil from the broken chandeliers aaturated the clothing of the unfortunate victims, and the whole mass was soon enveloped in flames. The hand had just ceased playing, when the orash was heard and the floor began to settle lengthwise in the centar; the joists slipped off the posts in the rear, and pulled out of the brick wall in front. The center settled rapidly and broke lengthwise. This threw people, tahles, stovea and all together. The falling floor barricaded the front doors, but they were soon chopped down.

AT the annual meeting of the Academy of Sciences, B. B. Redding, Prssident of the Board of Trustees, read the report of the Board of Trustees. It atated that the liabilities of the Academy at the beginning of 1881 were $2,956.47, without interest. At the present date the Academy owed nothing and had a cash balance on hand of $91.07. The total receipts of the year were $8,683.67; expenditures, $8,592 60. There is owing from membera $464.50. H. M. Newhall, a fellow member, had generously deducted $1,200 from the rent of the bnilding.

SMALLPOX is on the decrease in Chicago now. The cases have run down from an average of 15 cases per day during the 1st of Decemher to an average of 4 the latter part. There have heen 30,000 free vaocinations during Decemher, and arrangements have been made for 50,000 in January.

News in Brief.

AN agent of an Eastern packing establishment is in Glendive, M. T., buying bnffalo meat to ship East for canning.

THE investigation of the theaters in New York bring to light instances of failure to comply with the requirement of ths laws in nearly svery establishmsnt.

DE LONG'S store, at Fresno, was sntered by burglars on Thursday night. The thieves were snhsequently capturad, and are in jail and the stolen goods recovered.

IT is said that Los Angsles county produces 45% of all the corn raised in Californie. Last year's crop was 752,104 bushels, against 1,993,325 bnshels in ths whole State.

THE arrival of the nsw year and the throwing open of the Whits Houss has broken the season of univereal monrning in Washington society over President Garfield.

THE Southern Pacific Railroad Company, of Arizona, has appropriated $300,000 for the construction of the road from Yuma to Port Isabsl. President Crocker says the road will be completed in 60 days.

THE Sunday law went into forcs in Washington Territory on the 1st inst. In Seattle, the law is strictly obssrved, bnt the prevailing sentiment sesms to be that the law is void and will be disregarded in future.

THE Columbia and Pugst sound, otherwise the Northsrn Pacific Railroad Co., ie endeavoring to get a right of way along the city front of Seattle. The company promises to put in switches and side tracks wherever owners of wharves desire for ths handling of grain.

THE coinage at the United Statss Mints during Dec., 1881, was: Gold, 1,260,476 pieces; value, $10,220,530; silvsr, 2,445,100 pieces; value, $2,418,908; minor, 5,542 925 piecss; value, $58,263.

THE surveyors of the Atlantic & Pacifio railroad located the line of ths road through the town of Baksrefield, a few days ago. Ths fact caused grsat rejoicing in Baksrsfield, and a marked advancs in real estats is expsctsd.

ANOTHER grand cavern has recsntly heen discovered in ths Castle range, M. T. B. M. Bean, shsep hsrder, accidentally came upon its entrance. The main apartmsnt is about 100 yards in length and ths same in width, and the ceiling is from 60 to 100 ft. in hight.

THE great progress of Chicago as a monsy centsr is shown in the incrsass of surplus and undivided earnings and of ths dsposits of Chicago banks and hankers. In '80 the former were $3,413,659; in '81, $5,778 000. Ths deposits in '80 were $59,975,866; in '81 they reached $90,479,708.

THE SACKETT SCHOOL.—This well-known Oakland school for boys began its new year on January 3d, most auspiciously. Ths attendance of scholars has increased 50% since last term, and everything promises a prosperous year for the institution.

A Special Publication.

We call the attention of our readers to a special publication (in this number of the MINING AND SCIENTIFIC PRESS), with accompanying cuts of the Studebaker Manufacturing Co.'a carriage and wagon works, at South Bend, Ind. It will be perused with pleasure and profit, as these gigantio enterprises are the outgrowth of the progress of thia age—a part of our history and the pride of the Americ an psople.

Mining and Scientific Press.

THE MINING AND SCIENTIFIC PRESS is the leading mining journal in America, and enjoys a larger circulation among the more intelligent operators and workers in the gold fields of the world.

Established in 1860, it bas firmly maintained its positon as a reliable, progressive journal. The information given in its columns has saved millions of dollars to the practical miners, metallurgists, mill men, mine and shareholders on the Western side of our continent.

Among its contributors are the ablest and most experienced mining engineers, superintendents and practical miners in this country.

The PRESS gives a condensed summary of Mining News from the most important mining districts of the country.

New processes and methods of mining are described in its weekly issues. New mining machinery and improvements are frequently illustrated and explained in a manner to be of great value to all interested in mining.

As a scientific and mechanical representative of the Pacific coast it is decidedly popular, and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivalled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer, will find profit by its reading.

Subscription, $4 a year in advance. Sample copies, postpaid, 10 cents.

DEWEY & CO., Publishers.
No. 252 Market St., San Francisco, Cal.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $3 per (half-yearly) volume. In cloth and eather binding, $5. These volumes, complete, are scarce and valuable for future reference and library use.

Dewey & Co.'s Patent Agency and Newspaper Offices.

Dewey & Co.'s Patent Agency and the business offices of the Mining and Scientific Press, Pacific Rural Press, Pacific States Watchman and the Fraternal Record are now favorably situated at No. 252 Market Street. Elevator entrance, *No. 12 Front St., S. F.*

Our Agents.

Sewing Machines.

Several first-class styles, good as new, will be sold at a bargain. Call on or address H. F. D., at this office.

BOOKSELLERS, STATIONERS, ETC.—Messrs. Payot, Upham & Co., No. 204 Sansome Street, are one of the oldest, most enterprising and reliable firms in the book and station ery trade in San Francisco. Scientific, industrial and foreign publications are a specialty with them. They are also noted for their first quality of blank book and fine station ery line of goods.

Attend to This.

Our subscribers will find the dates they have paid to printed on the label of their paper. If it is not correct or if the paper should ever come beyond the time desired), he sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omission of agents.

PERSONS receiving a sample copy of the MINING AND SCIENTIFIC PRESS *with this notice marked*, are requested to examine the merits of the same, and consider fairly its claims for support, and if consistent, subscribe for the paper through the P. M. or agent delivering it, or otherwise. We shall send it, on trial, at the rate of $4 per annum for any period the reader may wish. Please notice our terms elsewhere, and if desired, send for further samples and information. Those who can circulate this No. further to our advantage are invited to do so.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

THE State Mining Bureau, No. 212 Sutter street, is open to the public from 10 o'clock A. M., to 5 o'clock P. M. daily, (Sundays excepted). Henry G. Hanks, State Mineralogist.

BY TELEPHONE.—Subscribers, advertisers and other patrons of this office can address orders, or make appointments with the proprietors or agents by telephone, as we are connected with the central systemin San Francisco.

CORRESPONDENCE on mining and other subjects represented by this journal is solicited from all reliable sources. Send us information, early and often, if ever so brief.

COMPOUND OXYGEN — NOT A DRUG

A NEW TREATMENT for Consumption, Asthma, Bronchitis, Catarrh, Dyspepsia, Hemicrane, Debility, Neuralgia, Rheumatism, *and all Chronic and Nervous Disorders.*

ACTS DIRECTLY upon the great nervous and organic centres, and *cures by a natural process of revitalization.*

HAS EFFECTED REMARKABLE CURES, which are attracting wide attention.

HAS BEEN USED BY Rt. Rev. John J. Keane, Bishop of Richmond, Va., Hon. Wm. D. Kelley, T. S. Arthur, and others, who have been largely benefited, and to whom we refer *by permission.*

IS STRONGLY ENDORSED: "We have the most unequivocal testimony to its curative power from many persons of high character and intelligence."—*Lutheran Observer.* "The cures which have been obtained by this new treatment seem more like miracles than cases of natural healing."—*Arthur's Home Magazine.* "There is no doubt as to the genuineness and positive results of this treatment."—*Boston Journal of Commerce.*

THE OXYGEN HOME TREATMENT contains two months' supply, with inhaling apparatus and full directions for use.

SENT FREE: a Treatise on Compound Oxygen, giving the history of this new discovery and a large record of most remarkable cures. Write for it. Address

ADMINISTERED BY INHALATION. Drs. STARKEY & PALEN, 1109 and 1111 Girard St., Philadelphia, Pa.

Depository on Pacific Coast.

WE HAVE ESTABLISHED A DEPOSITORY OF OUR COMPOUND OXYGEN HOME TREATMENT at San Francisco, Cal. This will enable patients on the Pacific Coast to obtain it without the heavy express charges which accrue on packages sent from Eastern States. All orders directed to H. E. MATHEWS, 606 Montgomery street, San Francisco, Cal., will be filled on the same terms on which we fill orders sent directly to our office in Philadelphia.

Patients ordering from our depository in San Francisco, should, at the same time, write to us, and give a statement of their case, in order that we may send such advice and direction in the use of the Treatment as their special disease may seem to require.

DRS. STARKEY & PALEN, Nos. 1109 and 1111 Girard Street, Philadelphia, Pa.

TONITE POWDER COMPANY, - - - 403 California St., S. F.

ENGINE LATHES IN SECTIONS.

Limit of weight for 25-inch Lathes, 300 pounds. For 17-inch Lathes, 150 pounds.

READY WITHIN 10 DAYS,

Standard and Special Machine Tools.

SAN FRANCISCO TOOL CO., No. 21 Stevenson St., San Francisco.

THE KENDALL HOSE COUPLING.

VIEW OPEN. PATENTED, MARCH 1, 1881. VIEW CLOSED.

1st. Cheapest. 2nd. No Wire Necessary. 3rd. Can be Attached or Detached with Ease. The whole requiring ess than one minute, and so simple that it may be done by a child. 4th. Does not Leak. It is absolutely water tight. 5th. Neatness. In separating it from the faucet, it can be done without filling the sleeve with water, or drowning the body. It is withal ornamental. Examine It! Give It a Trial; I Gusrantee Satisfaction! All Sizes Supplied. Address D. B. KENDALL, PATENTEE. American Exchange Hotel, San Francisco.

AN INTEREST IN A VALUABLE MINE FOR SALE.

The whole or part of the ECLIPSE GOLD QUARTZ Mining Company, for sale. The Keystone mine adjoins it on the south. It is situated in Amador City, Amador Co., and the title is protected by U. S. Patent. None but people of means need apply for full particulars, etc. Address G. W. KLING, Amador City, Cal.

Dewey & Co. { 252 Market St. } **Patent Agt's**

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press American and Foreign Patent Agency, the following are worthy of special mention:

Railway Track Gauge and Level.—Chas. F. Bergh, Alma, Santa Clara county, assignor of one-half to Lysander Collins, same place. No. 250,777. Dated Dec. 13, 1881. This track gauge and level consists in a novel arrangement of parts, whereby an instrument is made which will accomplish the object intended with ease and accuracy. The stock has shoulders hy which it rests, and fits between the rails. The top of the stock is cut out to form a recess, in which is a har, pivoted at one end, and carrying an ordinary level. The free end of the har is provided with a rack, with which a pinion on the end of a thumh-screw engages, so the har may be raised or lowered ahout its pivoted end. This means of adjusting the har and spirit level is much better than the set-screw method. On the sides of the har are graduated scales. When the track is straight, the level in the har will level it. When the track is to he curved, the degree heing first determined upon hy the direction or curve of the road, the object then to determine is, how much one rail is to be raised above another. It is a matter of calculation, that when a curve of a certain degree is made, one rail should be raised above another a certain distance. The scale of degrees and scale of inches on the swinging har are made to correspond, so that when a certain degree appears above the edge of the stock when the bar is raised, a certain inch line will also appear, and that line is the exact distance the rail must be raised when a curve of this degree is to he made on the track. As hefore said, the graduated scales upon the end of the har and the correspondence are derived hy calculation, and the object in having hoth the scales of degrees and of inches upon the har is, that the trackmen may see ahout how much to raise the rail without having to consult the tahles of calculation. Knowing the degree of curvature to he made, they have hut to raise the swinging har so that the degree shall appear upon the scale, when the inches, which are made to correspond, will also appear, and they can see at a glance how much to raise a rail. If the road-hed requires a very short curve to he made, the rails require to he separated a little more than in the case of a long curve. A sliding har s fixed in the gauge to account for this.

Egg and Fruit Carrier.—J. J. McIntyre, Oakland. Dated Dec. 27, 1881. No. 251,617. This is an improvement in cases designed for transporting eggs, fruit, or other similar articles; and it consists in a novel method of cutting, uniting and locking the strips which form the compartments that contain and separate the eggs, and that are placed in tiers one ahove the other in suitable cases, each tier having a loose hottom or diaphragm interposed between it and the next set of compartments. Many forms of compartment casee have been constructed, most of which have one or hoth of the sets of transverse strips notched upon the edges, and as these strips are usually made of pastehoard for economy, theee cut edges are easily folded down or destroyed hy handling and breaking of eggs. This invention contemplates the use of two sets of strips, those running in one direction having slots extending transversely across the center, hut not extending to the edges. The other set of etrips are sufficiently wide to just pass throngh and fill these slots, and they have small central slots just where they meet the other eet of etrips, through which a narrow strip of material passes, alternately to one side and the other of the first-mentioned strips, so as to form a lock.

Portable Covered Hammock and Frame.—N. Vizelich, Stockton. Dated, Dec. 27, 1881. No. 251,488. This invention relates to a portable hammock adapted to receive a cover, and to the frame for swinging said hammock, the ohject of the invention heing to provide a ready, convenient and secure place to lie down, when necessary. The invention consists in the arrangement and comhination of certain props, supports and hraces, which may he easily eet up and taken down, and in a hammock adapted to he suspended from the frame thus made, said hammock heing provided with head and foot etretchers and curved hars, upon which is laid and supported a covering, whereby protection is afforded to the occupant, and the whole device heing adapted, when taken down, to he rolled up together, the hammock forming the casing or sack, and strapped into s small compass, so that it may he transported with ease from place to place, as necessity requires.

Railroad Switch.—Marius R. Dahlgren, Oakland. Dated Dec. 27, 1881. No. 251,417. This improvement on railroad switches consists in a novel comhination of apparatus which is connected with the switch-rail to he moved, and has extensions in each direction, with crank-arme or disks. These arms are so placed that devices carried npon the locomotive may he thrown out so as to etrike either one or the other, and thus throw the switch-rail in either direction desired, and when approaching the switch from either direction or upon either hand.

Gag Runner.—William M. Blaine, Salinas. Dated Dec. 20, 1881, No. 251,021. This invention relates to an improvement in gag rnnners for bridle, and especially to the construction of a central hridge or support for the loop, and from the nnder side of which a spire projects for adjusting the gag rnnner. It consists of an open elongated frame, with a central transverse piece or bridge, from which the loop extends, heing made a part thereof, wherehy strength is gained. Two openings are thus formed in the frame or clamp throngh which the strap passes, and by which it can he slipped up and down. From the underside of the transverse piece or hridge forming the base of the loop, a spur projects to fit the holes in the straps, wherehy the gag runner is made adjnstahle. The object of the invention is to provide a gag runner, which will comhine strength, durahility and simplicity, and at the same time he adjnstahle wherehy the check can he regulated

Roller Device for Seams of Tin Roofs.—Chas. D. Morin, Woodland, Yolo Co., Cal. No. 250,446. Dated Dec. 13, 1881. This is a machine or roller device for rolling and flattening ont the seams on tin roofs of honses. It consists of a heavy roller, jonrnaled in a frame having a handle, in comhination with a brake for said roller, and an npper or supplementary frame, on which additional weight may he placed when necessary. The object of the inventor is to provide a device which will save labor and flatten out the seams regularly and easily, thns preparing them for the hetter reception of the solder. It therefore has application merely to such seams as reqnire to he flattened and is not for making and rolling upright seams on tin roofs.

Footstools for Rocking Chairs.—F. Franz, S. F. Dated Dec. 20, 1881. No. 251,034. The invention consists in a flat hoard or foot rest, under which is journaled a roller, and to which is attached a wire or rod, the other end of which is fitted to and is adapted to move back and forth upon a gnide board under the chair. The feet rest upon the hoard and hy the motion of the chair, said hoard is rolled hack and forth.

Furnace.—Henry R. Taylor, S. F. Dated Dec. 27, 1881. No. 251,485. This invention relates to the class of cupelling and melting assay furnaces. It consists in certain details of constrnction, whereby the inventor is enahled to make a furnace that will he strong and firm without the employment of circnmscribing sheet-iron cylinder or hands of strap iron.

Pacific Coast Weather for the Week.

[Furnished for publication in the Press by Nelson Gerom, Sergt. Signal Service Corps, U. S. A.]

The following is a summary of the rainfall for each day of the week ending Wednesday, Jan. 4th, at noon, for the stations named:

Date.	Olympia.	Portland.	Roseburg	Red Bluff	Sacramento	San Francisco	Visalia.	Los Angeles.	San Diego

*Sixteen hours missing from Olympia, and 8 hours from Portland, Roseburg and Red Bluff during week. Reports missing from north of Red Bluff this P. M.

A fearful calamity occnrred at Shanesville, O., last Saturday night. It resnlted in the loss of several lives, and serious injury to nearly 100 victims. A floor gave way witb a terrible crash, precipitating 300 people to the first floor. The red-hot stove fell with the crowd, and the oil from the broken chandeliere eaturated the clothing of the unfortunate victims, and the whole mase was soon enveloped in flames. The hand had just ceaeed playing, when the crash was heard and the floor hegan to settle lengthwise in the center; the joists slipped off the posts in the rear, and pulled ont of the brick wall in front. The center settled rapidly and broke lengthwise. Thie threw people, tables, etoves and all together. The falling floor barricaded the front doore, hut they were soon chopped down.

At the annual meeting of the Academy of Sciences, B. B. Redding, President of the Board of Trustees, read the report of the Board of Trustees. It stated that the liabilities of the Academy at the heginning of 1881 were $2,956.47, without interest. At the present date the Academy owed nothing and had a cash balance on hand of $91.07. The total receipts of the year were $8,683.67; expenditures, $8,592 60. There is owing from members $464.50. H. M. Newhall, a fellow member, had generously deducted $1,200 from the rent of the hnilding.

Smallpox is on the decrease in Chicago now. The cases have rnn down from an average of 15 cases per day during the 1st of December to an average of 4 the latter part. There have heen 30,000 free vaccinations during December, and arrangements have been made for 50,000 in January.

News in Brief.

An agent of sn Eastern packing establishment is in Glendive, M. T., bnying bnffalo meat to ship East for canning.

The investigation of the theaters in New York bring to light instances of failure to comply with the requirement of the laws in nearly every establishment.

De Long's store, at Fresno, was entered hy burglars on Thursday night. The thieves were snbsequently captured, and are in jail and the stolen goods recovered.

It is said that Los Angeles county prodnces 45% of all the corn raised in California. Last year's crop was 752,104 bushels, against 1,993,325 bnshels in the whole State.

The arrival of the new year and the throwing open of the White House has broken the season of universal monrning in Washington society over President Garfield.

The Southern Pacific Railroad Company, of Arizona, has appropriated $300,000 for the construction of the road from Ynma to Port Isahel. President Crocker says the road will he completed in 60 days.

The Sunday law went into force in Washington Territory on the 1st inst. In Seattle, the law is strictly ohserved, bnt tbe prevailing sentiment seems to he that the law is void and will he disregarded in future.

The Columhia and Puget sonnd, otherwise the Northern Pacific Railroad Co., is endeavoring to get a right of way along the city front of Seattle. The company promises to put in switches and side tracks wherever owners of wharves desire for the handling of grain.

The coinage at the United States Mints dnring Dec., 1881, was: Gold, 1,260,476 pieces; valne, $10,220,530; silver, 2,445,100 pieces; valne, $2,418,908; minor, 5,542,925 pieces; value, $58,263.

The snrveyors of the Atlantic & Pacific railroad located the line of the road through the town of Bakersfield, a few days ago. The fact caused great rejoicing in Bakersfield, and a marked advance in real estate is expected.

Another grand cavern has recently heen discovered in the Castle range, M. T. B. M. Bean, sheep herder, accidentally came upon its entrance. The main apartment is ahout 100 yards in length and the same in width, and the ceiling is from 60 to 100 ft. in hight.

The great progress of Chicago as a money oenter is shown in the increase of snrplus and nndivided earnings and of the deposits of Chicago hanks and hankers. In '80 the former were $3,413,659; in '81, $5,778 000. The deposits in '80 were $59,975,866; in '81 they reached $90,479,708.

The Sackett School.—This well-known Oakland school for hoys began its new year on January 3d, most auspicionely. The attendance of scholars has increased 50% since last term, and everything promises a prosperons year for the institution.

A Special Publication.

We call the attention of onr readere to a special publication (in this nnmber of tbe Mining and Scientific Press), with accompanying cuts of the Studehaker Mannfactnring Co.'e carriage and wagon works, at Sonth Bend, Ind. It will be pernsed with pleasnre and profit, as theee gigantio enterprises are the outgrowth of the progress of tbis age—a part of our history and the pride of the Americ an people.

Mining and Scientific Press.

The Mining and Scientific Press is the leading mining journal in America, and enjoys a larger circulation among the more intelligent operators and workers in the gold fields of the world.

Established in 1860, it has firmly maintained its position as a reliable, progressive journal. The information given in its columns has saved millions of dollars to the practical miners, metallurgists, mill men, mine and shareholders on the Western side of our continent.

Among its contributors are the ablest and most experienced mining engineers, superintendents and practical miners in this country.

The Press gives a condensed summary of Mining News from the most important mining districts of the country.

New processes and methods of mining are described in its weekly issues. New mining machinery and improvements are frequently illustrated and explained in a manner to be of great value to all interested in mining.

As a scientific and mechanical representative of the Pacific coast it is decidedly popular, and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivalled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer, will find profit by its reading.

Subscription, $4 a year in advance. Sample copies, postpaid, 10 cents.

DEWEY & CO., Publishers.

No. 252 Market St., San Francisco, Cal.

Bound Volumes of the Press.—We have a few sets of the back files of the Mining and Scientific Press which we will sell for $3 per (half-yearly) volume. In cloth and eather binding, $5. Theso volumes, complete, are scarce and valuable for future reference and library use.

Dewey & Co.'s Patent Agency and Newspaper Offices.

Dewey & Co.'s Patent Agency and the business offices of the Mining and Scientific Press, Pacific Rural Press, Pacific States Watchman and the Fraternal Record are now favorably situated at No. 252 Market Street. Elevator entrance, *No. 12 Front St., S. F.*

Our Agents.

Our Friends can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Cylinder Printing Press for Sale.

A large cylinder Hoe printing press, for country newspaper work, can be bought cheap by addressing Press, Box 2361, S. F.

Sewing Machines.

Several first-class styles, good as new, will be sold at a bargain. Call on or address H. F. D., at this office.

Booksellers, Stationers, Etc.—Messrs. Payot, Upham & Co., No. 204 Sansome Street, are one of the oldest, most enterprising and reliable firms in the book and station ery trade in San Francisco. Scientific, industrial and foreign publications are a specialty with them. They are also noted for their first quality of blank book and fine station ery line of goods.

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct or if the paper should ever come beyond the time desired, be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omission of agents.

Persons receiving a sample copy of the Mining and Scientific Press *with this notice marked*, are requested to examine the merits of the same, and consider fairly its claims for support, and if consistent, subscribe for the paper through the P. M. or agent delivering it, or otherwise. We shall send it, on trial, at the rate of $4 per annum for any period the reader may wish. Please notice our terms elsewhere, and if desired, send for further samples and information. Those who can circulate this No. further to our advantage are invited to do so.

Important additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

The State Mining Bureau, No. 212 Sutter street, is open to the public from 10 o'clock A. M., to 5 o'clock P. M. daily, (Sundays excepted). Henry G. Hanks, State Mineralogist.

By Telephone.—Subscribers, advertisers and other patrons of this office can address orders, or make appointments with the proprietors or agents by telephone, as we are connected with the central systemin San Francisco.

Correspondence on mining and other subjects represented by this journal is solicited from all reliable sources. Send us information, early and often, if ever so brief.

Copp's "U. S. Mineral Lands, Laws, Forms, Instructions and Decisions."—1881. 570 pp. In full law binding, $4.50; half law binding, $3, at this office.

Mining and Other Companies.

Persons interested in incorporatione will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for advertising.

DIVIDEND NOTICE.

OFFICE OF THE

Standard Consolidated Mining Company,

SAN FRANCISCO, DECEMBER 31, 1881.

At a meeting of the Board of Directors of the above named Company, held this day, an extra dividend, No. 37, of seventy-five cents (75c.) per share was declared, payable on Thursday, January 12, 1882, at the office in this city, or at the Farmers' Loan and Trust Company, in New York.

WM. WILLIS, Secretary.

Office—Room 20, Nevada Block, No. 309 Montgomery Street, San Francisco, Cal.

DIVIDEND NOTICE.

San Francisco Savings Union.

532 California St., corner Webb.

For the half year ending with December 31, 1881, a dividend has been declared at the rate of five (5) per cent. per annum on Term Deposits, and four and one-sixth (4 1-6) per cent. per annum on Ordinary Deposits, free of Federal Tax, payable on and after Wednesday, January 11, 1882.

LOVELL WHITE, Cashier.

DIVIDEND NOTICE.

The German Savings and Loan Society.

For the half-year ending December 31st, 1881, the Board of Directors of THE GERMAN SAVINGS AND LOAN SOCIETY has declared a dividend on Term Deposits at the rate of Five (5) per cent. per annum, and on Ordinary Deposits at the rate of four and one-sixth (4 1-6) per cent. per annum, free from Federal Taxes, and payable on and after the 9th day of January, 1882. By order,

GEO. LETTE, Secretary.

LUTHER WAGONER. JOHN HAYS HAMMOND.

WIND MILL. One of the best made in this State for sale cheap on easy terms. Address, W. T., care of Dewey & Co., S. F.

A NEW TREATMENT for Consumption, Asthma, Bronchitis, Catarrh, Dyspepsia, Headache, Debility, Neuralgia, Rheumatism, *and all Chronic and Nervous Disorders.*

ACTS DIRECTLY upon the great nervous and organic centres, and *cures by a natural process of revitalization.*

HAS EFFECTED REMARKABLE CURES, which are attracting wide attention.

HAS BEEN USED BY Rt. Rev. John J. Keane, Bishop of Richmond, Va., Hon. Wm. D. Kelley, T. S. Arthur, and others, who have been largely benefited, and to whom we refer *by permission.*

IS STRONGLY ENDORSED: "We have the most unequivocal testimony to its curative power from many persons of high character and intelligence."—*Lutheran Observer.* "The cures which have been obtained by this new treatment seem more like miracles than cases of natural healing."—*Arthur's Home Magazine.* "There is no doubt as to the genuineness and positive results of this treatment."—*Boston Journal of Commerce.*

THE OXYCEN HOME TREATMENT contains two months' supply, with inhaling apparatus and full directions for use.

SENT FREE; a Treatise on Compound Oxygen, giving the history of this new discovery and a large record of most remarkable cures. Write for it. Address

ADMINISTERED BY INHALATION. Drs. STARKEY & PALEN, 1109 and 1111 Girard St., Philadelphia, Pa.

Depository on Pacific Coast.

WE HAVE ESTABLISHED A DEPOSITORY OF OUR COMPOUND OXYGEN HOME TREATMENT at San Francisco, Cal. This will enable patients on the Pacific Coast to obtain it without the heavy express charges which accrue on packages sent from Eastern States. All orders directed to H. E. MATHEWS, 606 Montgomery street, San Francisco, Cal., will be filled on the same terms on which we fill orders sent directly to our office in Philadelphia.

Patients ordering from our depository in San Francisco, should, at the same time, write to us, and give a statement of their case, in order that we may send such advice and direction in the use of the Treatment as their special disease may seem to require.

DRS. STARKEY & PALEN, Nos. 1109 and 1111 Girard Street, Philadelphia, Pa.

TONITE POWDER COMPANY, - - - 403 California St., S. F.

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street - - San Francisco, Cal.

VULCAN BLASTING POWDER.

—THE MOST ECONOMICAL AND BEST—

Nitro-Glycerine Explosive in the Market.

In the suit of the Giant Powder Co. against the Vulcan Powder Co. for *alleged* infringement of Patent, it was held that the Giant Powder Patent was INVALID.

Nos. 1, 2 and 3 Vulcan,

Each grade superior to like numbers of any other Nitro-Glycerine Powder in the market.

VULCAN B. B.,

Superior to Black, Judson or any low grade Powder for Bank Blasts, Railroad work, or any work where Black Powder has been heretofore employed.

TRIPLE FORCE CAPS AND ALL GRADES OF FUSE.

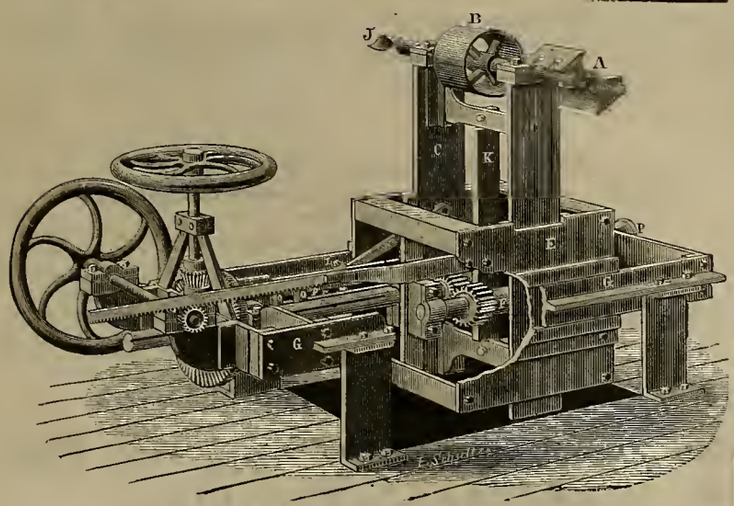
LEPLEY'S FRAMING MACHINE.



The above cut represents the Framing Machine invented by ISAAC LEPLEY, of Amador City, Cal. For perfection and rapidity of work it has no equal. Any form of cut, tenon, mortise, gain or lovetail in timber of any size can be made with exactness, and as rapidly as desired. It is complete in itself in all its parts, ready for the belt. The machine is simple in construction, and can be run by anyone of ordinary ability. Every mine requiring timber, and all mills where much framing is to be done, should have one, as a matter of economy. It will do the work of twenty men.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, JANUARY 14, 1882.

VOLUME XLIV. Number 2.

New Amalgamating Pan.

Frank A. Huntington, of this city, has this week received through the MINING AND SCIENTIFIC PRESS Patent Agency a patent for an improved grinding and amalgamating pan, which possesses some special features worthy the attention of mining men. The pan has nearly or quite vertical sides, upon which are supported dies, either in sections, or in the form of a complete ring, so as to receive the action of one or more shoes, which are fitted to an arm journaled upon a vertical support. When these are driven by the action of a revolving muller, the shoes are thrown outwardly against the dies, both by centrifugal action and by the resistance of the contents of the pan, to wings which project inwardly from the shoe supports.

The pan is of any suitable size and the ring die is dropped or fitted into it in a single piece or made in sections to fit around the inner periphery. From the muller, arms project toward the circumference of the pan, and have sleeves or sockets which carry vertical spindles. These spindles serve to support plates which carry the shoes.

These plates are bent, so that the shoes, when secured to them, will stand so as to present their faces fairly to the dies around the pan. These plates are carried toward the center nearly or quite radially from the spindles upon which they turn, and have broad vanes or ways upon their inner ends.

It will thus be seen, that when the pan is filled with pulp or material, and the muller is revolved the shoes will be thrown outwardly against the dies, partly by centrifugal action; but as the speed is not great enough to render this very effective, the effective work is mostly produced by the pressure of the pulp against the inner ends of the plates or vanes, which then act as levers and their power is increased proportionately with the speed of the muller. The angle of these vanes is such that they also serve to throw pulp outwardly, so as to pass between the shoes and dies.

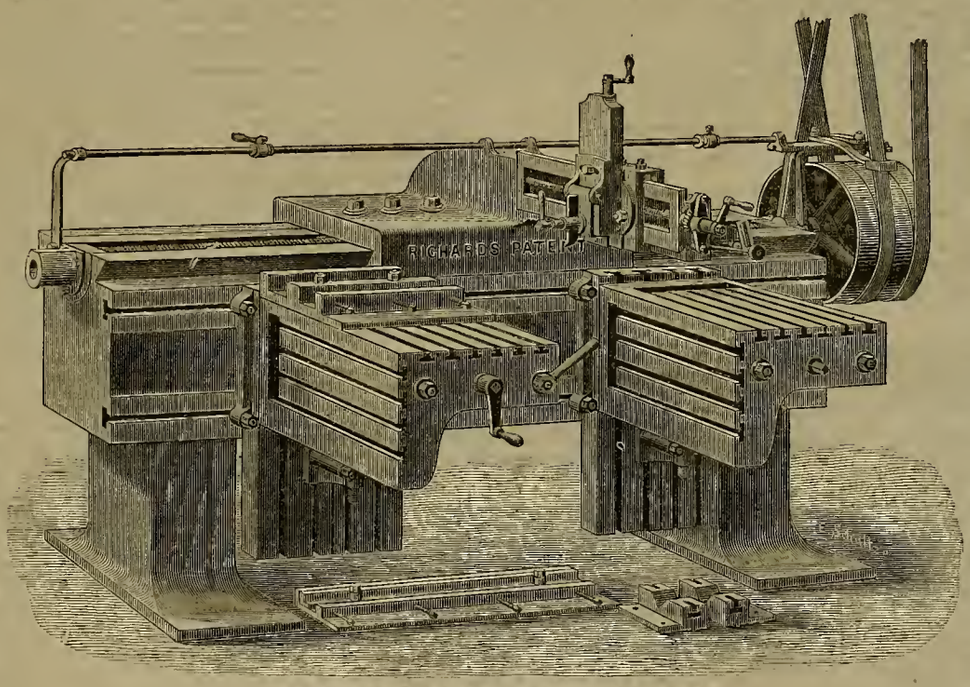
Above the shoes and wings is a horizontal disk which extends from about the edge of the wings nearly to the outside of the pan, thus leaving openings at the center and also around its periphery. Above this disk radial vanes project upward and these serve to guide the material and cause it to flow to the center above the disk. The course of the current will be decided by the disk and vanes, and it will pass below the disk and by centrifugal action to the periphery of the pan; thence upward along the dies, where it will be exposed to the action of the shoes and will then escape through the openings around the periphery of the disk, the vanes preventing a circular motion being imparted to it by the muller.

Mr. Huntington prefers to construct the dies and shoes partly of iron and partly of wood to provide a better surface for grinding. This may be done in various ways. One way is to perforate the shoes and dies, and into the holes short blocks of wood are driven so that the end of the grain of the wood is presented as a surface, which is about or quite level or flush with that of the iron.

In order to carry back any one or more of the shoes from the dies and prevent them from grinding, an executive arm or button is employed, fixed to a stem rising to a convenient hight for operation. By turning the stem, the button will be caused to press against the inner end of the plate or shoe, and will thus force the shoe away from the die and prevent further grinding. This is done after the grinding is complete and while amalgamation is going on, and prevents flowing of the mercury by continued grinding. Or, by reversing the motion of the muller, all the shoes are drawn back from the dies. Any plate, with its shoe, may be lifted off its plate without trouble, when necessary.

A California Planing Machine.

The engraving on this page shows a new type of planing machine, recently brought out at the San Francisco Tool company's works, in this city, the invention of Mr. J. Richards, the Superintendent. The machine is novel, and, we might say, remarkable, in many respects, especially in the great range of work that may be done on it. The tables, in front, can be removed, if necessary, so even the largest pieces can be planed. The stroke is 50 inches, and the traverse, 20 inches, so the area worked over is equal to 1,000 inches, or 7 square ft.



THE RICHARDS PATENT PLANING MACHINE.

This area stroke, and so on, gives a capacity nearly three times as great as can be attained by a shaping machine, of the old style, costing the same amount. No gear wheels are employed, so the machine is noiseless.

The company some time ago furnished Messrs. Savage & Sons, of Fremont street, a machine of this kind, that has been mainly employed since on large pieces. Among other things, most of the planing was done for a new lathe, to turn 6 ft. diameter, constructed by Messrs. Savage & Sons.

We take some pleasure in noticing this machine, as one doing great credit to our city, and the new industry under Mr. Richard's charge. We are informed that the company are now extending their facilities, and that no orders can be filled for some time to come.

Among the new tools making for use in the works, is a planing machine on the same plan, or nearly the same plan, as the one above, to plane 20 ft. long; also, a wheel-cutting machine for wheels to 6 ft. diameter, and a special lathe to turn 6 ft. diameter.

TELEPHONIC conversation, easily and distinctly understood, was held the other day between San Diego and Los Angeles, a distance of 145 miles of wire.

Foundry Notes.

The Pacific Iron Works report much increased activity in the demand for machinery. For a number of months the works have been running a full force, turning out a large amount of mining machinery for various localities. Among the late orders may be mentioned four sets of hoisting works for Idaho and Montana. One of these, including cages, cars, etc., is for the famous Mountain Con. Mining Co., at Butte City. It is intended to work a double compartment shaft to the depth of 1,200 ft., and is one of the best designed and most complete hoists ever constructed.

The firm has recently shipped a 20-stamp mill to Colorado, which they are erecting on the Kansas mine, near Fairplay, at an elevation of 11,000 ft. This is a new departure, and would indicate a preference for California-made machinery not heretofore shown. These works have long been regarded as headquarters for smelting machinery, and their copper and galena smelters are in great use in all parts of the country.

They have now under contract a 30-ton copper-smelting plant for the Santa Catarina Co., and one of the same capacity for the Globe Copper Co.; also a 40 ton galena-silver plant for the Pinal Co. All of these companies are operating in Arizona. The improvements recently patented through this office, add greatly to the durability and economical working of these furnaces.

A 100 H. P. Wheelock engine and boilers is also under contract for the Hollister Flouring Mills. This engine seems to be steadily gaining in favor among engineers and steam users.

POWDER EXPLOSION.—On Wednesday, an explosion of Hercules powder took place near Pinole station, Contra Costa county. It is stated that the steam chest of the engine burst and exploded 1,500 lbs. of nitro glycerine and 300 cartridges. One Chinaman was killed and several of the other employees were injured, but none seriously. The damage was only about $5,000, and the works will be running again in two weeks.

Not California Practices.

Every time there is a swindle or a failure or crookedness of any kind about a mine or mining company in which Eastern people are interested, the Eastern papers take it up and make a howl about the people "introducing the tactics into the management that paralyzed mining on the Pacific coast." All this is laid to California tactics, California practices and California customs.

This is all very well to talk about, but there is a good deal of bosh about it. There are mining frauds in the East as well as here, and in proportion to the population there are very many more of them there, for there are more rich speculators. People who buy mining stocks, if they can sell them for more than they give, are satisfied that they are shrewd business men; if they lose by the stock going down, out here they have learned not to say much about it. East they raise a great howl that they have been swindled, and then lay it to California practices.

It will probably be found that the managers and insiders never lose any money in these swindles; but that cannot be called a California invention, for this sort of result in not confined by any means to mining companies. It will also be found that glowing prospectuses have been published in the papers; and long and flattering accounts of the mine and its prospects for a dividend have also been given, with now and then notes saying the stock was bound to go up, etc. *This* is not a California method. They do not publish prospectuses here at all, not even cards saying where the offices are. Nor are those apparently respectable papers to be found here which make a practice of puffing mines for a consideration as there are in the East. That is purely an Eastern idea.

In every little mining camp out in the west there is a little mining paper, but they do not have their columns ready to sell to the highest bidder, to puff any kind of scheme that comes along. They would be killed in a month or two. It was reserved for large cities in the East to maintain half a dozen or so mining papers in a region a thousand miles or two from any mine. No Californian could do that. We acknowledge it beatsus, for it looks pretty hard to do it on any legitimate basis. A few respectable papers could live properly, but many of the publications must depend on revenues no decent journal would accept.

In fine, the reasons why frauds and swindles are carried out, cannot be laid to the door of California practices. No doubt Eastern speculators have picked up some of the bad practices in vogue here; but there is no reason for the press to lay the bad practices to our doors and take the credit for all the good ones to themselves.

When a mine is being examined, the good opinion of a "practical California miner of long experience" is much sought for, and this is heralded abroad, when favorable. Then the California experience is thought something of. After a while, when the Eastern people get hold of the mine and some rascality comes to light, it is very easy to lay it onto the shoulders of the "California practices." But if the enterprise is at all successful, all the credit is given to "the enterprising Eastern promoters, whose shrewd judgment led them to take the mine in hand."

ABOUT 18,000,000 ft. of lumber was cut in 1881 by the mills lying between Sacramento and the Summit on the Central Pacific Railroad.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

Treatment of Sulphurets.

EDITORS PRESS:—It is difficult to do justice to such an article as that on the above snbject in the PRESS of Dec. 31, 1881, from the London *Mining Journal*, and almost as difficult to pass it hy without notice.

The first impression produced by reading the article is, that the number of the London *Mining Journal* from which it is taken must have heen of rather ancient date, but a closer examination reveals the existence of internal evidence incompstible with such a supposition. The nomenclature and notation are evidently intended for those of modern chemistry, while the "chemical law" which forms the fundamental postulate of the argument, the law that simples combine only with simples, and compounds only with compounds, is totally at variance with the views now entertained by chemists, and has long since been abandoned as incorrect. In proof of this it is only necessary to refer to the compounds of cyanogen and of ammoninm, though many other instances might he cited, hut the question though interesting and important to chemical philosophy, is of no practical consequence in the consideration of the treatment of sulphurets.

The next point which attracts attention is the statement that "it is popularly helieved that gold exists in the metallic state only." Now, in this country, at least,

The Popular Belief

Is that the invisible gold existing in sulphurets is chemically combined with them, and only scientific people assert, with considerahle show of reason, that it is not so. Much of this gold, though not visible to the naked eye, is revealed by the microscope as minute grains, or films of extreme tenuity, in the metallic state. Native aurous or auric sulphide is not known, and that it does not exist in pyrites has heen pretty well proved hy the fact that none can he dissolved out of them by the proper solvents for gold snlphides. Gold *may* exist in combination with both sulphur and iron, but the question as to whether such a compound does exist in auriferons pyrites, is one which neither the writer of that article nor the writer of this can with confidence answer affirmatively on the hasis of known facts. But even this is of slight importance from a practical point of view. Quicksilver is indifferent to logic, and if the gold is not in a suitable condition, will have nothing to do with it, metallic or not.

Our writer next presents to the eye of the "scientific imagination," an interesting picture of the "contest" for the possession of the sulphur, which ensnes, when quicksilve is brought into contact with

"Auropyrites;"

A sort of free fight, in which the poor quicksilver is worsted, "sickening, flonring and frothing," (at the mouth?), which wonld he all very well if it were true; hut, nnfortunately for the picture, it is not necessarily so. Then, "evsry miner knows that roasting does not free the gold in the pyrites," we are told, and "in the bsst cases enough sulphur remains with the iron and the gold to prevent amalgamation with mercury." The trnth is that many miners know that a proper roasting does free a very large proportion of the gold, and the Australians have shown that it can in many cases be amalgamated to over 90%; the present writer has reached 80%. The principal difficulty lies, not in the retention of a small proportion of sulphur by the rossted mass, but apparently in the fact that the particles of gold are coated hy iron oxide, while the presence of lead is a more serious obstacle still. But the roasting often occupies 24, or even 30 hours, instead of "at most 18 hours;" this, however, depends upon the size of the particles, and the thickness of the bed of ore operated on, a few minutes suffic. ing, if the particles are small and the exposnre thorough. If amalgamation does not anewer with the roasted material, the chlorination process is frequently adopted with excellent results, though that process is quite ignored in the article referred to.

Saving the Pyrites.

Passing over a rather lame description of the method of concentration of the precioue metal in a matte or regulus by emelting, a method which is not by any meane universally applicahle, we come to remarks which would lead ns to suppose that the English are far behind the Americans in the art of "securing the pyrites in a fairly clean condition." Here we do not "catch the gold in mercury troughs" to any great extent, and we catch the pyrites by means of machines, which, while warranted to save 90% of them, might also be guaranteed to secure them in an almost perfectly olean condition so far as gangue is concerned at least, nor do the "two concentrating operations where one would euffice" involve the slightest inconvenience, nor appreciable increase of expense, because they both go on at the same time, without any handling of the material, while the saving of the free gold by amalgamation, in the battery and on the plates, ie very advautageoue as an immediate source of revenue, besides securing so much from the risks and losses incident to the subseqnent treatment of the ooncentrates by roasting or smelting, etc. Also, it is probable that a portion of the "float gold" which would escape the action of any concentrator, is saved hy the amalgamation.

Mr. Readwin's system of

Dry Grinding

In pans with mercnry will certainly not answer, even with medicated mercury. We have tried dry amalgamation, though we did not generally grind the quicksilver with the ore; the separation was troublesome enough without that. In Anstralia, they grind the quicksilver with moistened roasted pyrites; and although their results seem to be very good, yet they lose a good deal of quicksilver, snd, doubtless, some gold with it.

The French chemist spoken of, proposes to nse, not "calomel," which is insoluble and very difficult of reduction to metal, but corrosive sublimate, in presence of metallic iron. The method is hased on the well-known fact, thst when gold is touched by iron, in presence of even a very weak solution of corrosive sublimate, the gold is instantly amalgamated with mercury precipitated upon it hy galvanic action. The objections which present themselves are, that the iron will speedily decompose the corrosive snblimate without the contact of gold, and that it will not decompose the calomel, which is likely to he formed by the contact of the portion of mercury first reduced with the yet undecomposed portion of corrosive suhlimate. The production of calomel wonld not only cause the loss of the mercury so converted, hut would also tend to the sickening of that which might remain metallic.

Finally, the only distinction necessary to he made hetween mines of free gold in quartz, and mines carrying also anriferons sulphnrets is, that the latter mnst be furnished with concentrating machines in addition to the usual appliances for battery amalgamation, and a market or means must he found for the disposal of the concentrates. Where the latter are treated by chlorination, it wonld, in many cases, not answer to omit the amalgamation before concentration, because some of the particles of free gold may be too large to be completely dissolved hy chlorine, nnless the screens are of inconvenient fineness, cansing greater loss in the concentration, and reducing the working capacity of the mill.

C. H. AARON.

Note.—The error of describing the snlphides of mercury as oxides, in the article from the *Mining Journal*, is probably a slip of the pen, which, however, should not have hsen permitted to occur in an article of that character.

Gillis Mountain.

A correspondent of the Candelaria *True Fissure:* After a long silence I will endeavor to enlighten themsny readers of your pspei as to what is going on in this quiet community. The mines have never looked hetter than they do at present. The Burnley is taking out plenty of $4,000 ore from a point 150 ft. helow the surface. All the hoisting has been done by man power, hut the management proposes to put a whim on the mine, and the same was delivered on the dump to-day by John R. Benton. That gentleman is now on his return trip to Luning with a load of ore from the ahove mine. There are several loads sacked which Mr. Bsnton has engaged to hanl to the railroad. From all appearances, the mine is improving as depth is attained. When the whim is in position and sinking commences in earnest, some big strikes may be looked for. J. R. Benton and C. E. Kennedy had some very fine prospects in the district, with water rights which, if they were in the hands of some one of small capital to assist in developing them, could he made paying properties. I think the station, Luning, has a bright future awaiting it. There are four mining districts which wil lmake this their shipping and receiving point. These will be Garfield district on the west, Silver Stsr on the south, Santa Fe on the east, and last, but not lesst, Gillis Mountain on the north. These, together with a vast country to the east, inclnding Grantsville, Downeyville, Lodi, Ellsworth, Ione and Belmont, will all come to this railroad station for their freight. There is a tri-weekly stage running from Luning to Grantsville, connecting with the eastern lines. It is owned and operated hy the well-known firm of Gilmer, Salishury & Co., and from present appearances there will he a lively passenger travel this way. The coach comeeinloaded down. I saw six passengers get off yesterday and all hound for your town, which seeme to he the point of attraction to a numher just now.

GAS TREATMENT OF WHOOPING COUGH.—In the treatment of whooping congh in gae worke, as lately resorted to, especially in London, the purifying chamber consists of a large room with doors and windowe freely open, and each contains 24 vessels, holding 5 cubic meters of depurating snbstance—lime and sulphate of iron mixed with sawdnst—throngh whioh the gas has to pass. When the workmen are emptying and refilling these vessels, the children with whooping cough are placed around it, and inhale the vapors which escape; they are in an atmosphere containing ammonium sulphide, carbolic acid and tarry products. As to the efficiency of thie treatment, one physician reports that of 120 cases persevered with, in 20 there was entire failure, 48 showed improvement, and the rest were cures; it is thought, however, that it acts only upon one element of the malady, viz., catarrh.

Academy of Sciences.

President Davideon's Annual Addree.

The reports of the officers convey to the members the details of the business of the Academy.

We have the satisfaction of knowing that a continued interst is manifested in the work of the members, and that a more general enoouragement is extended to our efforts to increse scientific study and investigation. Yet we cannot but acknowledge that we need more workers and spscialists in many valuable fields of research.

One main drawback to enlisting investigators is our present financial inability to print the proceedings of the Academy, either promptly as hulletins, when the interest and value of a communication wonld warrant it, or at the end of the year when the regnlar volume is closed. You have been assured personally by Agassiz, Hooker, Gray, Hayden and others that to impart vitality to such an institution, its proceedings mnst be systematically printed and spread abroad. In the rivalry which naturally exists among investigators, their scientific reputation depends upon their priority, as well as their ability. The principle and sentiment involved are as praiseworthy, and, in one sense, as valnable as the clsim for originality on the part of the inventor.

I believe if we had the means to print, that we should experience a large and lively

Interest in Original Work.

We are now five full years behind, but the matter has already been prepared by the unassisted labor of the Secretary for the printer, or for the examination of the publication committee; and certainly there appears no immediate prospect for bringing up the old work, or utilizing the new. We are still in debt for former publication. I am in full accord with the trnstees, who are the custodians of the propsrty of the Academy, and who for four yesrs have been endeavoring to reduce the indehtedness of the Academy incurred during the long commercial distress which pervaded the cosst.

They have managed the financial affairs of the Academy as they would their own private husiness, and have earnestly and conscientiously studied how best to hnshand our resources, and yet grant whatever "aid and comfort" was practicable. They have heen able to obtain the moneys needed for actual dishursements throu h their personal influence at the bank; and we know that whenever it is possible, they will afford the means for publishing. I have trusted that some public-spirited member would appear as a special bensficiary in

Establishing a Publication Fund;

And I still hope that with the prosperous days of trade we may awaken such a friend to the dissemination of scientific knowledge. The title pages of many scientific publications hear evidence of this liheral spirit.

For scientific research, the munificent

Endowment of Charles Crocker

Is so fresh in our memories that I need but refer to it to excite your admiration. That fund plainly means work, and we helieve that valuahle scientific and practical results will he derived from it. Upon my application to the trnstees, they have agreed to pay for the printing of a special bulletin of the Academy, in which I propose to give the short hut suggestive history of this hequest, for circnlation among the scientific societies of America and Europe.

Our donstions from correspondents and collectors throughont the coast continne large and valuable, although wsnt of room allows us to exhihit, for the present, only the most interesting. Much time has been given to the classification of our collections by the cnrators in mammals and birds, ethnology and osteology, botany and mineralogy. There is, however, so much material on hand that we can hnt regret the lack of work which prevents some of the departments from being properly attended to. To the library constant additions are being received from scientific societies, from individuals and through our representatives in Washington. Nevertheless, we miss several foreign exchanges on account of our not publishing.

As assistiog us in a practical, tangihle manner, I wish to mention the fact that our fellow-members, Messrs. Gerstle, Goldsmith, Wormser and Niebaum, have again gone upon my honds for the pnrchase of 2,000 gallons of alcohol in such quantities and at such times as it may be needed hy our wants. By this means we are enahled hy law to ohtain the alcohol for preserving epecimens of natural history without paying the tax thereon. Although the individual bonds are large, the gentlemen named promptly acceded to my reqnest.

It is the dnty of the president to notice the deathe of members duiing the year. So far as I have learned, the only member deceased since our last annnal meeting, is Mr. Henry Chapman, for many yeare, one of our most active cnrators and most modest members, yet full of practical intereet in our progress. The academy, very properly, at once expressed its loss and its sympathy with the family.

Again, I nrge upon our younger membere to file into the ranke of the workers, and to give to the academy some part of their time in classification and identification, as well ae the results of their investigations, whether tentative or final. Every search must yield some fresh information and elicit honest commendation. They need not he afraid of having their credit misappropriated, for it has been, to me, a eource of great satisfaction to have seen, in 10 years, among so many persons, so little of jealousy, and so much of hearty willingness to commend and encourage.

Among the many subjscts which naturally occupy the minds of our members, is the

Spread of Scientific Knowledge and Scientific Methode.

Its importance is manifested to us in a thousand ways, and being satisfied of its necessity, and the ripeness of the time for its agitation, I have ventured to put together a few snggestions npon the introdution of elementary science in our public school system, and upon the formation of sohools of trade, art, and commerce.

[This address we give in another column of this number.—EDITORS PRESS.]

Hydraulic Mining in Mono County.

From the Bodie *Free Press* of recent date we take the following account of what is being done on Mill Creek canyon by the Mono Lake Hydranlic M. Co.:

The hydraulic minss on Mill creek cover 20,080 acres, secured hy pstent, of gold-bearing wash gravel, some three miles in length hy one in width, commencing a little above the mouth of Mill Creek canyon, and extending down the creek in a southeasterly direction to within a half a mile of Mono lake. Work was commenced on the 10th day of October last on the big ditch, whose proposed dimensions were 5 ft. wide on top, 3 ft. on the bottom, 4 ft. deep and having a carrying capacity of 2,500 inches. Up to date it has been completed one mile from where it taps the creek to its present point of connection with the penstock. The latter is 50 ft. long, 4 ft. wide hy 3 ft. deep. There is now in use 300 ft. of the best Norway iron pipe, 24 inches in diameter at the penstock, and tapering down to 11 inches at the giant. The largest sized monitors with patent deflectors are used. The nozzles are 4½ and 6 inches in diameter, and under an 8-foot pressure the former is capable of throwing 500 inches, tbe latter 800. There is now only about 1,500 inches of water in the channel hed, and it is all required. The flume is 700 ft. long, snd it is being extended at the rate of 14 ft. per day. Its width in the clear is 48 hy 36 inches in depth. The hottom blocks are 10 inches hy 36 inches in diameter; lining hlocks 4 hy 18, with six sets of riffles: dip, 4 inches in 12 ft., while its gravel capacity is 4,000 tons every 24 hours, with 2,000 inches of water. Seventy thousand ft. of lumher have thus far heen consnmed in its construction. The hank is 53 ft. high, and in six days' work of ten hours each, with a 4 inch nozzle under an 80-foot head, 20,000 tons of gravel have heen washed down and flumed away.

The huildings consist of a boarding-house, lodging-house, office and blacksmith shop.

The creek, on leaving the canyon, makes a sweep from east to south ahout three miles to the lake. The company is now getting ready to lay its pipes from its present workings directly south to the lake, instead of following the old creek channel and commence cutting hsck on hed rock to the extreme northern houndary of its property. This manner of procedure will give it a fine tailing off or dumping plsce, save one and one-qnarter miles of flume and pierce the center of the claims, whose highest point is 900 ft. Ample fall will thus be secured. There is now enough pine timher of the hest quality standing on the claims along the creek to furnish hlocks for two miles of flume. All the water coming from the canyon has been secured by purchase snd pre-emption. They can also increase the number of inches to 5,000 when necessary. All that is required is five more miles of ditch, which csn he easily constructed, as the soil is good picking ground. There are two to five colors—and sometimes a dozen can he found—in every pan of dirt prospected on any part of the creek, or in its vicinity.

Through the exertions of Messrs. D. E. Jones and J. D. Wilson, the company was organized and incorporated at San Francisco, on Septemher last, with a capital stock divided into 100,000 shares—par value, $10 per share—with the following named officers and Board of Trustees: President, J. D. Wilson; Vice-President, George Duncan; Secretary, John Elbert; Trustees—George Duncan, J. D. Wilson, D. E. Jones, John Elhert and —. Curtis. The company now employs 20 men with D. E. Jones as Superintendent; J. Wilson, assistant; L. Jacohs, foreman; W. Brownlee, assistant night foreman. The two latter-named gentlemen are old, experienced Dutch Flat miners, and expree themselves pleased with the outlook. The company has already expended $15,000, and is going to show to the people of Mono county that a veritable placer honanza existe in our midst, and that capital and skill will yet extract hidden millions from around the desolate shores of Mono lake.

WORK FOR ALL WHO WANT IT.—Just at present, and for the remainder of the winter, Wood River will he hlest by a demand for laborers, which is unusnal in the early history of mining camps. The husiuese of cutting ties for use in building the Oregon Short Line hranch of the Union Pacific railroad affords employment at very remunerative rates to all laborere who want work. There is therefore no need for any man to be idle on Wood River this winter, as all who are willing to work can earn from $3 to $4 a day.—*Wood River Times.*

MECHANICAL PROGRESS.

A New Motive Power for Street Cars.

The problem of finding some cheap, convenient and easily-applied motive power to take the place of horse power for street cars, is one that has engaged the attention of scientists and practical mechanics for some years, but thus far without any marked success. Now, as we understand, an entirely new departure has been taken, and it is claimed that a practical motive power has been discovered, which will meet the long-felt want. Quite recently articles of incorporation were filed by the United States Spring Car-Motor Construction Co., an organization originating in New Jersey and Philadelphia, which expects in a little while to revolutionize the existing methods of propelling single passenger cars on streets and elevated railroads. Two inventors, Samuel Anstin and Robert Steel claim to have successfully solved the problem of a cheap and easily-controlled motive force to take the place of horses in street car propulsion. They propose to do it by powerful steel springs operating upon an endless chain, and the above company has been formed to manufacture trucks containing the mechanism.

The great difficulty hitherto has been the impossibility of manufacturing the springs in this country, which it is claimed has been overcome. Springs of a similar pattern have been made in various parts of Europe, and to a considerable extent practically utilized as applied to invalid carriages and other conveyances in France and elsewhere. The inventors believe they have hit upon a process of making the springs, and have been able to so fer demonstrate their claim as to secure the capital necessary to make a practical test of the invention.

Ten of these coiled springs are to be set in an ordinary car truck, and in appearance, as well as in operation, they will resemble the main-spring of a watch of massive proportions. They will exert their power upon endless chains operating upon the wheels. Each spring will be inclosed in a hand or clamp, so arranged that by the simple movement of a lever, answering to the brake now in use, each clamp will be compressed upon the springs, closing them altogether, and not only shutting off the power, but holding the wheels at a standstill. Then when the pressure of the lever is taken off, the force exerts itself, and the car will be started. When wound up, as they will be each trip or two, at the end of the route, by a stationary engine, each spring will be about sixteen inches in circumference. By a very ingenious idea in construction, the inside end of the spring is the largest, and it tapers from nine inches to one inch in diameter. This causes the pressure to increase as the spring unwinds, and makes it greater just before it expends itself than at any other time. The length of time a spring will last probably remains to be determined, but the inventors claim that the springs will certainly preserve their elasticity for at least four or five years, providing each single spring is not kept in continuous service.

The Increasing Use of Glass.

There seems to be an impression of late that glass must soon come into a much more general use than it now obtains. It has been suggested as a suitable material for water mains, for street lamp-posts, and for many other purposes for which cast iron is now used. Mr. Siemens proposes to prepare a toughened glass for these purposes. He claims that he can prepare a glass which will be much stronger than iron castings, imperishable and incorodible. The cost per pound, allowing more profit to the maker than can be obtained from iron, is twice as much the cost of the latter, but the specific gravity is so much less that the consumer will be able to obtain glass articles about 33% cheaper than similar goods in cast iron.

Some of the Pittsburg glass makers are proposing to use it in the form of blocks, like granite or marble, for structural purposes. One writer says: "Perhaps not one builder or contractor in 10, if told that the common grades of glass have a crushing strength nearly four times as great as that credited by experienced engineers to the strongest quality of granite, would accept the statement as true. Yet it is a fact, and being so, the query as to why glass has not received more attention from architects as a structural material naturally suggests itself. A reporter had a talk with several prominent glass manufacturers on the subject, and in answer to an interrogatory as to whether blocks of glass could be made in suitable lengths and sizes and so annealed as to be utilized in the construction of a building in place of stone, they said that it could be done. Said one of these gentlemen:

"'This question has been considered by myself a number of times, and, although I do not want to advocate the absolute abolition of brick and stone, yet in the erection of art galleries, memorial buildings, etc., a structure composed of blocks of glass in prismatic colors would be alike a unique, beautiful and lasting structure. With the numerous inventions which have come into use of late years in connection with the production of glass, the cost has been gradually going down while the quality of the fabric is steadily becoming better. One objection which would be raised to the durability of a glass house, might be that the blocks would not take a bind or adhere together with common mortar. This objection can readily be set aside by the use of a good cement, and when completed the structure would stand for ages, barring extraordinary accidents, or, mayhap, cataclysm. As to the cost of a glass house, it can be kept down to but a small percentage above the price of cut granite, as there are many points where saving gains can be made. Thus, for instance, in building with stone, you have to pay the stone masons, and when it comes to elaborate examples of carving, in Corinthian pillars, collars and capitals, etc., why, the work is rather costly, as compared with glass, when the latter can be molded in any shape or form, and the work accomplished in much less time. I am convinced that the time will come when we will see such a building erected.

"'Scarcely a day passes that the sphere of glass as an article of use does not become widened. In parts of Germany and on one line in England, glass ties are being used on railroads, and thus far have given satisfaction, combining all the requisites of the wooden tie with the virtue of being susceptible to usage at least 75% longer than wood. Progress is also being made toward rendering glass ductile, and to-day threads of glass can be made that can be tied in knots and woven into cloth. Were one disposed to give play to fancy and fuse it into fact, a house entirely composed of glass could be built with walls and roof and floors fashioned from melted sand. Carpets of glass could cover the floors, the wall decorations embodying the forms and colors of the most ultra æsthete; sitting on glass chairs or reclining on glass couches, and arrayed in glass garments, eating and drinking from glass dishes, such an one could realize that the age of glass had come. Yet nearly all of this 50 years ago would have been classed with the then impossible telephone and electric light, and this statement would likely have found its place in the catalogue *Expurgatorius*."

IMPROVEMENTS IN LOCOMOTIVE BUILDING.—Inventors have shown a disposition of late to depart altogether from the old and seemingly well-established general form of locomotive engines. A great many changes have been made in the details of locomotive construction since its early days, but the machine itself still remains the same in general appearance. The Wooten dust-burning engines present a somewhat different form, and the Fontaine, with its main driving-wheels and most of the machinery above the boiler, is still more novel in the arrangement of parts, though most of its outline remains the same. Another new locomotive—Dr. Rauh's—does not at all resemble the ordinary locomotive, except that it has wheels and a cow-catcher. The boiler or boilers extend from end to end. The smoke-stack, steam dome, cylinders and driving gear are all in the center, grouped together under the cab. The purpose of this construction is to get the center of gravity in the center of the base formed by the driving-wheels, and to put the motive power also in the center. If one of Dr. Rauh's locomotives should be cut in four quarters, each quarter would be exactly like the other quarters in form and weight. Whether these new forms are practically better than the old remains to be proved by actual work, but it is a good thing for inventors to get rid of the notion that they are bound to follow closely an adopted form or system while seeking to make improvements. Habit, custom and prejudice are so many dead weights on inventive genius. They should not enslave the mechanic, however, though he, more than anyone else, needs to know what has been accomplished, and why certain forms have been adopted.—*Ex.*

IRON WIRE.—Some of the anomalies presented in the expansion and contraction of iron wire, as observed by Prof. Norris, have led him to the conclusion that in steel and iron containing free carbon, there is a contraction or shortening which is excited by heat, and which proceeds simultaneously with the dynamical expansion and marks its true amount; this is divisible into high and low temperature contraction. In cooling a strained iron wire from redness, it was found that the contraction due to cooling was, at a certain point and for a limited period, changed into action of elongation; in good iron wire this irregularity could not be detected, but in hard wire and steel was very apparent. The wire has to be raised to a very high temperature before the temporary elongation during cooling can be seen, and it does not take place if the wire is heated only just beyond the temperature at which it occurs.

A NEW VARIETY OF GLASS.—A Vienna chemist has recently devised a new variety of glass. It does not contain any silica, boric acid, potash, soda, lime or lead, and is likely to attract the attention of all professional persons on account of its peculiar composition. Externally, it is exactly similar to glass, but its luster is higher, and it has a greater refraction, of equal hardness, perfectly white, clear, transparent, can be ground and polished, completely insoluble in water, neutral, and it is only attacked by hydrochloric or nitric acid, and is not affected by hydrofluoric acid. It is easily fusible in the flame of a candle, and can be made of any color. Its most important property is, that it can be readily fused onto zinc, brass and iron. It can also be used for the glazing of articles of glass and porcelain. As hydrofluoric acid has no effect on the new glass, it is likely to find employment for many technical purposes.—*Wiener Gewerbe Zeitung.*

SCIENTIFIC PROGRESS.

No Organic Matter in Meteors.

A Louisville (Ky.) paper reports an interview with Prof. J. Lawrence Smith, of that city, in the course of which Mr. Smith gave reasons for discrediting the reported discovery of organic substances in meteors, as claimed by Prof. Hahn, of Berlin. Mr. Smith said:

"Although I have probably examined more microscopic plates of fragments of meteorites than any other person, still I have never discovered anything like organic remains in any of them. Besides, the well-known chemical composition of these bodies is averse to the existence of any such remains as spoken of by Prof. Hahn. Were these remains present, we should discern carbonate of lime on their interior. The two or three that have any carbonate of lime were discovered and analyzed by myself, and in these cases the carbonate of lime was an accidental constituent of incrustation deposited on the surface after their fall. In the microscopic examination of these polished plates of meteorites the two predominating minerals, enstatite and bronzite, will, by their fissures and forms, sometimes remind one of vegetable and other organic forms, but the merest tyro of an observer will trace here nothing but a rare resemblance. And, furthermore, the very ingenious nature of these minerals precludes the possibility of organic remains, even in terrestrial minerals of similar kind. Not knowing of any eminent German geologist named Prof. Hahn, I thought it but reasonable and logical that I should inquire something about him from my friend Prof. Hawes, now in the employ of the Smithsonian Institute, and the best lithological microscopist in this country, and who recently returned to this country after 10 years' study with Prof. Rosenbaum and others into the microscopic character of rock. In answer to my inquiries, Prof. Hawes wrote me this letter:

"'I read that paper of Prof. Hahn's. He is a kind of half-insane man, whose imagination has run wild with him. These forms which he so accurately describes and figures have long been known to exist in meteorites, and have been frequently described by mineralogists and microscopists. They are mainly composed of enstatite or bronzite in radial forms, and fractured in such a peculiar manner as to give them the appearance of structure. Some of the American meteorites which I have examined show these forms in great beauty, but Prof. Hahn is the only man who has seen anything organic in them, and his paper has excited nothing but ridicule. It reminds one of the long and laborious research of a German professor who found a whole flora and fauna, which he named with double Latin names, and which he found in his microscopic examination of basalt.'

"It is very clear to my mind," continued the professor, "that these cranky observations, viewed with the spectacles of the imagination of Prof. Hahn, have obtained more publicity than they merit."

Comets.

Mr. W. Mattieu Williams, the manager of the Royal Polytechnic Institute of London, recently delivered a very interesting lecture on "Comets." These erratic visitors, he observed, are very numerous, Arago estimating their number at 17,500,000. The lecturer explained how these figures are arrived at, and described the method of sweeping the heavens with a telescope in search of comets. He showed on the screen the appearance presented on the first observation of a comet and the gradual growth of its tail. He also exhibited the portraits of various historical comets, and described the circumstances connected with their appearance. He especially referred to the investigations of Donati on the comet bearing his name, and the manner in which the luminous matter of the nucleus is first thrust out toward the sun and afterwards repelled from it to form the tail. He indulged in some speculations as to the composition of comets' tails, and the very difficult problem which their sweeping round so rapidly presents. He then went on to touch on the probable effects of a collision between a comet and the earth, exemplified by instances of some approximate collisions that have occurred, and concluded with an account of the observations of Dr. Huggins and other astronomers on the recent comet, as to its chemical composition, as revealed by spectrum analysis. Mr. Williams is organizing an exhibition of scientific inventions of a popular character.

Stone, Bronze and Iron Ages.

Prehistoric archæology advances rapidly. It is not so very long ago since Worsaae's epoch-making book first firmly established the primitive division of the early human past into the three ages of stone, of bronze and of iron. Then came the discoveries of Boucher de Perthes and others, systematized by Lyell, which resulted in the recognition of that still earlier stone period described by Sir John Lubbock as paleolithic. Since that date the archæologists of France and England have advanced to a regular classification in order of time of the vast heterogeneous collection of human remains belonging to the elder stone age; but the result of their researches has hardly yet obtained sufficient general recognition outside the restricted scientific circle. It is probable that most cultivated people still continue mentally to divide the prehistoric period into three ages of stone, bronze and iron, and to subdivide the first-named age into a paleolithic neolithic epoch. In reality, such a division, though practically convenient, is grotesquely disproportionate. The so-called stone age is made to extend over an enormous lapse of time, and to include portions of the geological tertiary period, the whole of the quaternary, and part of the recent; while the small remainder of the recent period is handed over to the bronze and iron ages. This scheme is almost as absurd as a division of English history into the Victorian, the Georgian and the pre-Georgian epochs, the last named being subdivided once more into the Anglo-Saxon and Elizabethan periods. French Archæologists have far more correctly recognized six main divisions of prehistoric time, the first five being equivalent to what we ordinarily describe as the paleolithic age, and the sixth comprising the neolithic, bronze and iron ages of the recent period of the geologists. It is only by such a stricter and more chronologically accurate subdivision that we can properly appreciate the great slowness of human evolution in its earlier stages, and the vast lapse of time covered by the so-called paleolitheic period.—*Pall Mall Gazette.*

American Ferro-Manganese.

The amount of speigeleisen and ferro-manganese annually consumed in the United States is about 30,000 tons, by the aid of which we are enabled to produce about 150,000 tons of Bessemer and open-hearth steel. A small portion only of the metallic manganese used here is produced in the United States, and that chiefly from Spanish ores. The rest is imported from Europe.

This should not be, since it is well known that we have fuel and labor in abundance here, and plenty of a good quality of manganese ore, especially in the Southern States. In fact, we are, to some considerable extent, exporting the ore to Europe, where it is manufactured into ferro-manganese, or spiegeleisen, and returned to us again as a metal to enter into our Bessemer steel product. We ought to utilize more fully the products of nature with which we are so abundantly supplied, and employ our own labor not only in working our manganese mines, but also in reducing the ore to its metallic result.

COLORED GLASS.—Much has been said about the inability of modern glass manufacturers to make window glass imbued with the rich and beautiful colors peculiar to the windows of old cathedrals in England and on the continent. It is not generally known, however, that the secret of securing those wondrous tints has been discovered by one of our glass manufacturers. After a long series of experiments conducted in conjunction with Mr. Thos. Garfield, of Boston, a cousin of the martyr President, he has found that the rich effects in those old cathedral windows are owing to the poorness of the quality of the glass. Owing to the imperfect mixing of the ingredients by the old glass makers, the substance did not unite closely, and in consequence it became porous, and the minute particles of soda in the composition are exposed and act in the function of radiators, which give brilliancy to the colors of the window. In making window glass in colors now, the makers prefer to leave the surface rough, in order that by exposure to the elements it may go through the same beautifying process alluded to above.

EARTHQUAKES.—Dr. K. Von Fritsch, of Halle, says that the cause of earthquakes does not exist further down from the surface of the earth than 10 or 14 miles. After citing a number of instances to show how far the shock of a steam hammer or that produced by an explosive may be felt, he appears convinced that rather feeble forces produce earthquakes, which make themselves very sensibly apparent at great distances from the active center. He says that earthquakes might be and must be produced by the increase and decrease of volume of rocks under the influence of physical and chemical forces, and by concussion by the opening of crevices in rocks, and by the subsidence of masses of rock due to these agencies. Many shifts are subjected to extension stress, and when crevices occur the schists must enter into oscillations like those produced in tuning plates.

THE MILKY WAY.—Many astronomers, from Herschel downward, have spent much time in speculating upon the structure and functions of the great stellar streams known as the Galaxy or Milky Way. This part of the heavens has recently been made an object of careful study by M. Honzeau, of Brussels Observatory. He has indicated its composition by means of curves of equal luminous intensity. Looking casually at the Milky Way, one might be disposed to think it luminously nearly the same throughout. But M. Houzeau finds it in a series of luminous plates or masses, to the number of 33, each diminishing in brightness outward from the center. These are arranged almost exactly along a great circle of the celestial sphere. The solar system is nearly in the plane of this equator, and probably near its center.

THE bullion production of Utah promises to be the largest in many years, and the outlook for the coming year is more encouraging than ever.

The Mining Share Market.

There is very little of interest to say concerning the mining share market; our tables shows what slight fluctuations have occurred. The *Enterprise*, in speaking of the situation, says: As we can hear of nothing in the mines to cause any tumble, the cause must be sought for in some other direction. All work is going on favorably at the north end, and the ground that is being explored, is of a very promising character. The south drift on the 2700 level, from the main drift run between the Union shaft and the joint Union Consolidated and Sierra Nevada mine, is out but a short distance. It is finding good seams and bunches of quartz, but must go some 150 ft in order to reach the point where it is expected an ore body will be found.

The north drift of the 2700 station of the joint Mexican and Union Con. winze is beginning to cut stringers of quartz that yield promising assays. This drift is going into a very interesting section in which good assays were obtained on the level above from the several drill holes run. Indeed, there are a number of points at the north end from the 2500 down to the 2,800 level, where ore is liable to be found almost any day.

The main east drift on the 2900 level of the Ophir and Mexican is still in gronnd of a very favorable character, with no sign of an east wall.

At the old bonanza mines they will soon be in a position to make extensive explorations, not only in said mines, but also in connection with the Best & Belcher and Gould & Curry.

The Savage folks are now making it their chief business to connect their main incline with their 2400 level. Once they get a hole through at said point, it will give a circulation of air that will be of great importance to all the middle mines, and we may then expect to see work commenced in earnest in the Hale and Norcross and Chollar and Potosi mines.

The Yellow Jacket folks are now exploring ground that shows many seams and feeders of quartz that give low assays. At the same time the general appearance of the grounds is very favorable.

The Imperial folks are again fairly at work on their lower levels, and in the east drift on their 2800 level are finding streaks of quartz that promise to lead to ore.

At the Alta, Overman, Crown Point and Belcher, work is progressing favorably, and at American flat work has been resumed in the Baltimore at a point where there is already in sight a considerable streak of ore.

The Gunsight mine, Meyers district, Arizona, is claimed to be the biggest kind of a big bonanza. It is backed by Hon. Samuel P. Ely, one of the great iron manufactnrers of Marquette, Michigan, who, after an inspection of the mine, advanced the necessary money for its development and up to the time of the organization of the present company, had expended $80,000 on the mine.

Meetings and Elections.

Vulcan Powder Co.—Jan. 10. Directors—S. Heydenfeldt (President), J. Baum (Vice-President), Wm. Ashburner, F. J. Lebreton and Julius Jacobs. Shainwald was appointed Secretary. The affairs of the company were proved to be in the most prosperous condition.

South Hite M. Co.—Jan. 9. Directors—L. A. Booth (President), T. A. Mudge, S. D. Osborne (Vice-President), W. H. Widman, F. A. Beslin (Secretary).

Silver King M. Co.—Jan. 9. B. A. Barney, President; J. L. Jones, Vice-President; James M. Barney, Treasurer and General Manager; R. M. Phillips, Superintendent; Joseph Nash, Secretary. Directors—W. H. Stanley. Aarou Mason, James M. Barney, J. L. Jones.

Argenta M. Co.—Jan. 9. Directors—J. L. Browne, J. E. Dixon, Thos. Cole, George Congdon, W. H. King.

Leviathan M. Co.—Jan. 9. Directors—H. A. Deming, L. W. Boyer, R. W. Heut; C. F. Tolford, G. P Thaller. H. A. Deming, President; L. W. Boyer, Vice-President; B. B. Smith, Secretary.

Gila M. Co.—Jan. 9. Directors—G. W. Handy, Jno. Hammond, E. P. White, Mowry W. Smith, J. M. Hinkle, G W. Handy, President; Jno. Hammond, Vice-President; J. T. McGeoghegan, Secretary.

Pacific Stock Exchange.—Jan. 9. Directors—President, C. L. Weller; Vice-President, Baldwin Gardiner; Secretary, F. L. Unger; Assistant Secretary, S. F. Clough. Executive Committee—T. Whitney, F. Franks, D. Rich

S. F. Stock Exchange Co.—Jan. 9. Committee on elections: C. W. Fox, M. P. Hall, S. Dixon, C. H. Stoutenborough, O. V. Walker, J. S. Wilson, S. B. Boswell. The old officers were elected with the exception that Mr. Wakefield was elected Vice-President in place of Mr. Schmiedel, who declined to run.

Albion Con. M. Co.—Jan. 12. Directors—L. I. Robinson, Thomas Bell, S. Heydeufeldt, Henry Pichoir, Henry T. Scott, Clinton Gurnee, Sydney M. Smith. The Secretary's report shows that the company received during the year 1881 the sum of $217,086,77. Of this sum, $196,520.10 was in the shape of assessments, and $3,520.52 from the sale of ore. The amount of cash on hand to date is $4,949.58.

Town Sites and Mineral Claims.—Acting Attorney-General Phillips, on the 24th ult., submitted to the President his opinion in regard to the Tombstone, Arizona, cases, which was to-day referred to the Interior Department. The opinion is, in substance, that the location of town sites cannot deprive persons of mineral rights, who have previously acquired and previously pre-empted mineral land. They have lawfully the right to go ahead and take out the mineral in the ground of the town site, but they must not destroy any of the town improvements or streets; that its surface may be preserved for the town, but the mineral underneath the surface belongs to the parties who have pre-empted the mineral land there, but that the mineral must be taken out without detriment or injury to the town.

Adolph Sutro has sent a large lot of books to the public schools of Sutro, Nevada, recently, and has given $600 each to the Almshouse and City and County hospital in this city, for the purchase of reading matter.

The Sutro Tunnel company have built an ore dump near the mouth of the tunnel with the intention of extracting low-grade ore when their connection with the Forman shaft is completed.

About 90 tons of ore are daily extracted from the Crown Point and milled, averaging $14 per ton.

Fifty tons of low-grade ore are daily extracted from the Belcher.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

Pipe Collapsed.—Amador *Dispatch*, Jan. 7: Last Wednesday when the water was turned into the Plymouth branch of the Amador canal, a collapse of 750 it occurred in the pipe crossing Amador creek. This cast a temporary gloom over the brow of Supt Towne, but he at once sent below for more iron, and will have the pipe replaced as soon as the work can be accomplished.

Upper Rancheria.—Evans & Fitzgerald are ready to send off a few debris and sluicens as soon as water can be got through the Volcano ditch. A rich Chinese merchant from Oleta has a company of Chinamen fixing up the old Rice claim at Rancheria with the intention of working it this winter. They are putting on a hydraulic to be worked with a little giant Strickland & Co. commenced piping again last Tuesday morning, but they will have to close down again in a few days if it doesn't rain.

Loyal Lead.—*Ledger*, Jan. 7: The grading of the mill site is progressing. It is understood that arrangements have been made with the North Gover Co., for the leasing for a term of years of the suitable mill site upon which grading work is progressing. The 20-stamp mill of the Pennsylvania has been purchased and moved, ready to be erected on the new site. There is no prospecting or work of any kind going on in the Loyal Lead. The impression is, however, that the mill is being erected mainly with a view to crush the quartz which has been extracted from the various claims in the Black Hills or Lava Beds. A large quantity of rock has accumulated, which it is believed, will pay handsomely.

Pacific—Plymouth Cor. Amador *Ledger*, Jan. 7: In the 1000 level of the Pacific connection has been made with the old works from the Empire side, and in a few days rock will be hoisted. Men are now driving a tunnel at the 1100 level to strike the ledge. The mill will be ready to start as soon as the pipe is laid, and the tail-race completed. It is expected, unless some unforeseen difficulty arises, that all will be in running order in about 10 days.

Empire.—This mine is pegging away in its old path. No new developments have been made worth noting, except a small vein north of the north shaft, which it is hoped will turn out well. The mill is running 70 stamps. There is ore enough to keep the full 80 stamps going, but the belt pulleys of 10 stamps are considerably injured, the result of the late boiler explosion.

Seaton.—The new 20-stamp mill will be pounding out the precious metal in a couple of weeks. Rock is being taken out through the tunnel and placed on the dump. Rock from the Seaton paid well years ago. But few men are employed at present.

CALAVERAS.

Good Clean-up.—*Mountain Echo*, Jan. 10: Osborn & Co., the owners of the hydraulic on Smith's flat, made a clean-up after a run of 12 days, realizing therefrom $90 Only three men are employed on the mine.

Rhubarb Mine.—As a matter of mining news we would state that the Rhubarb mine, situated in Nassau valley, is now in full operation. The proprietor who has been to considerable expense to prepare the mine for work, has erected a 6-inch hurdy gurdy wheel, to which is attached a pump three-fourths of an inch in diameter, which, it is said by competent judges, will throw from 15 to 20 quarts of water per day. There is also a windlass attached to the wheel by suitable machinery, which will probably raise from 12 to 14lbs at a draft. This mine has been located for many years, and a vast amount of money has been expended in working it. The main shaft is 26 ft in length, by 2½ ft in width, and 47 inches in depth; it is well timbered to a depth of 14 inches, and has never yet yielded a color, but the venerable proprietor swears that he will live in hope if he dies in despair.

Douglas Flat.—Operations are again resumed in the Eureka; a larger pump has been put in the mine, and the water is being slowly pumped out. Work will commence in good earnest in a few days. The Old Judge mine is still in full blast, and the company is extracting more dirt than usual, and will in future clean up three times a week.

DEL NORTE.

Elk River Mine.—Del Norte *Record*, Jan. 7: The Elk river mine has closed down. The box factory will run for some time longer.

Condon.—Mr. Truett has stopped work on the Condon copper mine. Since the transfer of the mine to the present owners work has been done at several places. Below the tunnel and westward of a north and south line intersecting it, ore has been uncovered by stripping the surface. From the open cut drifts have been run westerly, northwesterly and northerly, two of which showed more or less ore. Above this open cut, further along on the lode, a little prospecting has brought to light ore of varying grades. The labor in the tunnel has been perhaps the least satisfactory, though we understand that Mr. Murray, the foreman, anticipates a gradual increase in the bulk of yellow ore, or copper sulphurets. This character of copper ore, we are informed, is usually a exponent of permanency, and that, therefore, should Mr. M.'s theory prove well founded, this one opening may establish the constant value of the mine. In addition to the production of some considerable ore, excellent fire clay has been discovered, and a little asbestos. Rumor says the company intend to erect smelting works in the spring.

EL DORADO.

More Mining Improvements.—*Mountain Democrat*, Jan. 7: J. E. Lyon, came down last Thursday from his mine at Pleasant valley, which is looking very fine, and upon which he will soon contract for putting up a mill, the machinery having been purchased. Prof. Tuck and son have contracted for a number of Huntington batteries to be put up on their Ora Fino mine, near Shingle Springs. An engine run by compressed air has been set up at the 600 level of the F. G. Q. Co.'s mine. It works to a charm.

Mill Property Burned.—Last Saturday night, at the St. Louis mine, about 5 miles above this city, the mill and hoisting works, one of the finest properties in the county, was destroyed by fire. Mr. Biveu, the manager, was absent in Amador county, where he received a dispatch announcing the calamity, and as speedily as possible came over to investigate the matter. He was expecting tidings that the water in the mine had been so far lowered as to have reached the Cornish pump, when the news of the fire reached him. The buildings were partially insured, but probably not to an amount sufficient to cover the losses.

INYO.

Death Valley.—Inyo *Independent*, Jan. 7: T. F. A. Connelly writes from Gold Mountain that he has been on an exploring expedition into Death Valley. Some relics of the parties who perished there 32 years ago were found, consisting of a pocket-knife, a wagon-spoke, some bolts and a wagon-tire. Mr. Connelly's party visited the lowest place in the valley, and found the weather quite warm, so much so that coats and vests were discarded, and the perspiration started freely, especially in walking.

Cerro Gordo.—Mr. Crapo, with 2 shifts of miners, is engaged in crosscutting the ledge in his big mine on Buena Vista hill, Cerro Gordo. The depth is 100 ft, and so far the developments are reported as extraordinary, as to good ore and a big ledge, though nothing more than expected by miners and others familiar with the property.

Ore.—Supt. Wingard yesterday sent to San Francisco some hundred and odd pounds of average ore taken from the new opening on the Green Monster mine, over in the Inyo foothills, from which is expected orders to further prosecute the work of development.

Watcoba.—Mr. W. L. Fuller, who has lately been do-

ing considerable work for New York parties on some of the mines in Waucoba district, which formerly belonged to Bierstadt, Major Egbert, Dr. White and others, was in town yesterday. Mr. F. is highly pleased with the properties, with the abundance of ore, wood and water, and says that the only convenience lacking is a road across the summit of the Inyos and from thence down to the mines. On the Summit mine a shaft has been sunk 25 ft, showing a ledge 4 ft wide and on the vein of 2 ft, which assays $125, $300 and $400 per ton. This is silver ore, free milling, and the ledge crops out for 600 ft, in a lime and slate formation. Some 10 tons of ore is on the dump. The Wyandotte is argentiferous galena, averaging 34 ounces per ton silver. It is opened by a tunnel 18 ft long, and shows 1½ feet of solid ore; there are 15 tons out on the dump. The Blanca, a silver ledge about the same as the Summit mine, has a shaft 22 ft in depth, showing ore which assays $60 and $124 per ton, with about 12 tons out. These locations are situated on the east side of the Inyo range, about 15 miles north of Beveridge, and 20 miles southwest from Deep Spring valley. Mr. Fuller is expecting orders to go on with work.

To Return.—Supt. Holt, of the Rex Montis, has made arrangements with the company to run the mill himself all through next season, and will be here in a few days to get things ready for an early start. He says: "In the spring work will be resumed in the big tunnel, with a strong hope of continuing it until the Rex Montis is reached—this is the intention at all events. The company has awaked from its lethargy to the necessities of the case." Among other items Mr. Holt adds the following concerning the company's Secretary, Mr D. H. Ward, who paid the mines here a visit some 2 years ago: "Ward is in China, having chartered 8 ships before his departure to load back with goods and coolies—not, however, for Rex Montis, but for other purposes—a contract in which he is connected of $9,000,000, and an agent is now East to increase the contract to a much larger amount."

Inyo.—The Supt. says: The mill has continued to run steadily since my last, with good results, and the ores running fully as high as I estimated. Including what I have already shipped for month of January, 1882, I expect it to be very near $40,000 for the month. Am now running through my low grade ore, reserving the rich for last of run. Our Eureka mine still continues to develop fine, with every prospect of making a large and extensive body of rich ore. At present I am milling ores from this mine which average $150 per ton. All of the other mines continue to look well at all points.

MARIPOSA.

Diltz Mine.—Mariposa *Gazette*, Jan. 7: The principal work at present upon this mine is driving a breastwork of dirt and rock, threaded with numerous stratas of quartz running at right angles from the main vein, the latter of which is left undisturbed. The breastwork alluded to will average 40 ft in depth by 100 ft in length. Giant powder is freely used to loosen up and cave the bank, from which is selected the paying ore and dirt, the refuse being thrown aside. The dirt and decomposed matter is loaded upon cars and taken to the flume, already prepared to wash, whenever there is sufficient water. There appears upon the face of the work at the present time, 30 strata veins of quartz varying in size from 1 inch to 3 ft. The casings of the stratas are rich in free gold, besides the solid quartz is considered good milling rock and is piled up for that purpose. Capt. Diltz is preparing to drive the work more extensively than has heretofore been done, by increasing his force and using more powder He starts for San Francisco to-day to lay in supplies and ammunition, with a view to prosecuting the work upon his mine with increased vigor. The Mariposa Quartz and Lumber Mills M. Co., represented by Mr. Wm. Shreve, have taken hold of this mine, and are erecting one of their rotary crushers or grinders, several of which are now in successful operation elsewhere. Mr. Shreve is confident of success in this enterprise, and that large profits will be realized therefrom, is the prevailing opinion of those best informed with the mine and the proposed method of working it. The mine is recorded and known as the "Reed Gold Bearing Talc Mine."

MONO.

Standard Con.—Bodie *Free Press*, Jan. 10: There were extracted and shipped to the mills during the past week 1310 tons of ore from the 300, 385, 500 and 550 levels. The average pulp assay for the week was $17.14. There was shipped to San Francisco $21,566 in bullion. The upraise on the Cook vein, 3-5 level, has been raised 14 ft; total length, 147 ft, showing a vein 4 ft wide. The different stopes look well and are yielding as usual.

Bodie Con.—During the past week there were 70 94 tons of ore sent to the mill, and 60 0 tons were extracted from the mine, as follows: 7.9 tons from the 5th inclins level, 62 tons from the 6th level and the workings below. The mill crushed 114.04 tons, of which the average assay value was $75.24 per ton. The average assay value of the tailings was $8.07. The bullion shipmont amounted to $7,080.34.

Union Con.—During the past week 12 ft were added to this length of the south drift on the Bonnsr vein. The rock has been firm, but several additional seams of clay and quartz have made their appearance. The ore lying next to the foot or west wall of the vein still continues the highest in grade. Its width has increased somewhat of late. The additional quartz making its appearance in the vein has divided the porphyry in the center of the vein, and considerably lessened its width. The average assay of the ore taken from the vein the past week has been: Gold. $27.53; silver, $11.05; total, $38.58. A drift north on the vein will be started next week, running north from the tunnel to the north boundary line.

Tioga.—Since last report some new developments have been made. From the 982 level the west crosscut No. 4, has been extended a distance of 90 ft; progress for the week being 21 ft. In the last report mention was made of quartz seams of value being cut. The entire distance run during the past week has been in a mixture of porphyry and quartz. The east crosscut No. 3 from the same level, is in 70 ft; progress 13 ft. There is no change to note since last report in connection with this portion of the work.

North Standard.—Supt. Harry Loryea reports as follows for the week ending Jan. 9th: During the past week the east crosscut has been advanced 0 ft. The formation passed through looks very encouraging. The north drift has been advanced 8 ft. The ledge in this drift is 4 ft wide. The drift on ledge No. 2 has been advanced 6 ft. The ledge is 3½ ft wide. The ore will assay $30.78 a ton. The stopes show an ore body 4½ ft wide and look as well as usual.

Noonday.—The usual quantity of ore is being extracted and milled from the 212, 322, 412 and 512 levels.

Con. Pacific.—The turntable is completed, and hoisting from the station goes on regularly.

Bodie Tunnel.—The upraise on ledge No. 20 made fine headway during the week The mill is being overhauled preparatory to receiving the stamps, which are en route from San Francisco.

Goodshaw.—Six ft, four inches were added to the depth of the shaft during the past week. The water has disappeared and everything is running smoothly.

NEVADA.

The Banner Mine.—*Transcript*, Jan. 7: The new steam pumping and hoisting works at the Banner mine, which were recently constructed at Lawrence & Barlow's foundry, have now been in successful operation for several days. The plant includes a 12-inch Corliss engine and very heavy machinery. The crown-wheel weighs 5,800 pounds, the fly-wheel 3 tons, and the other parts in proportion, making it one of the most powerful lots of machinery in the county. The building is 70x40 ft in dimensions. Operations are being carried on through an old incline 635 ft north, on the surface, from the deep workings of the former Banner company. The new owners are now down 280 ft, and propose to sink 420 ft further before drifting. At the 700-level it is believed the chute, which is pitching north, will be found within 40 ft of the incline, into which it will come by the time the 800 is reached. A depth of 700 ft on this inclins will open ground over 100 ft lower than the early workings reached. The incline is 5x10 ft in dimensions, has 2 compartments, and requires no timbering as the ground it passes through is very hard. It is now going down at the rate of 10 ft a week Supt J. E. Brown estimates that it will require a years' hard work to reach the required depth of 700 ft Six men are employed underground and 4 on the surface. James Donald, a first class practical miner of many years experience, is in charge of the work as foreman.

PLACER.

Big Ledge.—Placer *Herald*, Jan. 7: Mr. J. J. O'Sullivan is at present sinking on what is known as the Big Ledge, located on the ridge between Rich flat and the North Fork, a short distance south of Auburn, and he finds the rock as he goes down fully better than he had expected. The ledge is some 8 or 10 ft thick, and at a low rate per ton, could be made to pay handsomely.

Col. J. H. Brown, of Michigan Bluff, has got his new 5-stamp quartz mill, which he has been erecting in Bird's flat, near that town, completed and in operation. If the Colonel's ledge shall prove nearly as rich as the surface ground in that locality has been, then certainly he has his fortune.

SIERRA.

Work—*Mountain Messenger*, Jan. 7: Dr. Biber has just put several men to work at the St. Charles Hill mine, a few miles below Goodyear Bar.

Good Hope.—Half a dozen or more persons have filed liens against the Good Hope quartz property.

Snow.—It commenced to snow on the hills Tuesday night, and the prospects are good for a heavy fall. Five or 10 ft of snow would insure a good water season, as what snow there is, is full of water and the ground is warm and well soaked.

B. M. Ex. Co.—At the annual election of the Bald Mountain Extension Co., the following were elected directors: J. A. Vaughn, H. T. Briggs, S. B. Davidson, N. H. Meany and J. A. Blohm. H. T. Briggs, was chosen president, and J. W. Orear appointed Sec'y and Treas. The board of directors meets regularly on the 6th and 20th of each month.

SISKIYOU.

Another Cut.—Yreka *Journal*, Jan. 7: The Centennial Co. have commenced another cut. They have made a long and successful season. Their ground pays from top down. The Yreka M. Co., have a large force at work enlarging the capacity of their reservoir. The tunnel on the Empire quartz mine has just been completed, which will give drainage to the rich vein which paid so well on the upper level. Judge McConaughty has completed his ditches at French creek in Scott valley, for the purpose of working ground he has bonded, or rather leased for 25 years, with the new Plant amalgamating machine, lately patented, for saving the finest gold. The Judge prospected these mines with Senator Jones in 1857, while on a hunt in the mountains, Jones having come up from below on a hunting excursion. The Centennial Co. found richer pay than ever in bottoming up their cut, finished last week, but keep the result private, a rule adopted by the company, not being desirous of bragging.

TRINITY.

Trinity Center.—Cor. Trinity *Journal*, Jan. 7: The mines are about ready to run, and in good shape. Bloss & McClarey are putting in a new 6-ft flume, high enough to give them a good dump. When this is completed they will have one of the best rigged claims in the county.

NEVADA.

WASHOE DISTRICT.

Union Shaft.—*Enterprise*, Jan. 8: Are easing shaft timbers and repairing the drain tunnel on the 1600 level.

Utah.—Have finished up work on the bob pit at the 2250 level. The east drift on the 2500 level has been advanced 25 ft.

Mexican.—On the 2700 level the main south drift has been extended 20 ft. On the 2900 the joint Ophir east drift has been advanced 12 ft.

Con. Virginia.—Are still cleaning out and repairing the old drifts and winzes on the 1600 and 1700 levels connecting with the old Con. Virginia shaft.

Union Con.—Have resumed work in the joint Sierra Nevada east winze.

Caledonia.—Are still cleaning out and repairing drifts and winzes on the 1000 and 1700 levels connecting with the old Con. Virginia shaft.

Sierra Nevada.—On the 2500 level the winze in No. 2 crosscut has been sunk and timbered 6 ft; the station for the winze in crosscut No. 3 is now completed. Drill hole No. 5 has been extended 130 ft. The main north drift has been extended 30 ft, and the north drift 16 ft. On the 2700 level work in the joint Union Con. east winze has been resumed.

Ophir.—During the week 245 tons of ore have been extracted from the croppings, and 332 tons and 1,330 lbs. sent to the mills. Assays have not been received from the mills.

Alta.—The rock in the face of the east drift still continues very hard. Rock hoisted, 528 cars; wood burned, 75 cords; strokes made by pump, 59,800.

Yellow Jacket.—During the past week the east crosscut drift, 275 ft south of the shaft on the 2828 level, was advanced 24 ft; present length of same, 120 ft; ground porphyry and quartz, which gives low assays. On the 3000 level the east crossdrift from the switch is in 390 ft, having been extended 34 ft since last report. East crossdrift from face of south lateral was run 32 ft; whole length of same, 96 ft. Both of these drifts have passed through several quartz seams.

CANDELARIA DISTRICT.

Northern Belle.—*True Fissure*, Jan. 7: On account of the favorable prospect in the winze from the west drift on the fourth level sinking has been commenced in the main shaft. The principal work in the fourth level during the week has consisted of sinking the winze mentioned above and in running the crosscut from the upraise to connect with the winze from the third level. The winze below the fourth level is now down a distance of 25 ft, and the outlook is quite encouraging, showing 2 ft of ore which will average $80 to $90 per ton, some of the assays going as high as $400. The formation in the vicinity is also very promising. The daily yield of ore from the mine has been about 50 tons. Mill No. 2 is running steadily and doing the usual amount of work. Total bullion shipment for December, $79,040.31. Shipmeut on January account to January 4th, $4,469.02.

Mount Diablo.—The winze from the crosscut at the bottom of winze No. 1, on the third level, has reached a depth of 42 ft and shows ledge matter in the bottom. The intermediate, below the third, does not look as well as at the time of the last report, but the prospect is good for the ore to open. The east drift from winze No. 3 is in 80 ft and has small bunches of low grade ore in the face. The winze from the west drift on the second level is down 62 ft and shows a well defined vein of $45 ore. The east drift on this level does not look so well, but there is every reason to expect that the same ore body now showing in this direction on the third level will be struck by running ahead the drift.

Parkess.—The main frame of the building for the hoisting works is finished except the roof, which is delayed for the want of shingles. The engine and boiler are in place and being painted.

ESMERALDA DISTRICT.

Mines and Mills.—Esmeralda *Herald*, Jan. 7: Many men are scattered over the hills in this district doing assessment work and fixing the boundary monuments of their claims. Ball and Groth are still at work on the Centennial, and the ledge as they go down continues good. The pipes are laid to the Humboldt mill and the water is running into the tanks—one on the side of Table Mountain and the other at the mill. We learn that the last of the machinery is now at Hawthorne. In the Cortez the ore chute in the incline, to extend from the intersection drift to the drift 83 ft above, or the 150-ft drift from the upper tunnel level, is being rapidly constructed. This level is now full of very rich ore. Still running the main tunnel back to find the hanging wall of the ledge, which is expected to be encountered in the next 20 ft Work is being prosecuted all through the mine and developments are entirely satisfactory to the superintendent.

EUREKA DISTRICT.

Ore Reduction.—Eureka *Sentinel*, Jan 3: Mr R. Zeile, Assistant Supt., and W. J Stephens, foreman of the Eureka Con. reduction works, went to the Eureka tunnel yesterday, to examine the ore with a view to taking a contract to reduce it at the works where they are engaged. From the first and second-class dumps each, they took away a number of samples from which assays were made by Mr. David Lunbom, as follows: First grade, $267.56; and the second grade, $89.99 per ton. The chief purpose of their visit was to determine the per cent. of lead carried by the tunnel ores, which they were satisfied upon investigation; so that it is now fixed that these ores will not be shipped away to Salt Lake, but be reduced in Eureka This is gratifying all around. The Tunnel Co. lose nothing by the bargain, as when freight, handling and other expenses are considered, the cost of reduction in Salt Lake of ore shipped from Eureka is about the same as the cost of reduction here. The Eureka Con. makes its profit, and the work will give employment to a number of men in the camp who would otherwise be unemployed. It was the subject of general remark with reduction works at home we should have to ship ores away hundreds of miles to be reduced. It will be learned with gratification that the shipment of ore started and already at the E. & P. depot will be ordered back, and that the future destination of all Eureka Tunnel ores will be the Eureka Con. reduction works

SILVERADO DISTRICT.

Rich Ore.—Eureka *Sentinel*, Jan. 8: A piece of galena ore carrying considerable "black metal," taken from the Queen mine, Silverado district, was brought in yesterday, which is said to assay $2,500 per ton. This mine has been a good paying property, the owners of it having been able to erect out of the proceeds of their work steam hoisting works. Developments are going on all the time, which the mine pays for, and more. The main shaft is of size 6x8 ft and is down 215 ft. A drift is run off northerly from the shaft, from which a winze has been sunk 25 ft. on a vein of ore 2 ft thick, that runs clean across the shaft. This ore will work an average of $300 per ton, and the vein shows signs of permanence. About 2 years ago considerable ore was struck in this mine at a depth of 100 ft from the surface, and was followed by an incline, in which it seemed to finish. The discovery of a paying vein of ore at the present depth is hailed as a sign of a permanent paying property. The Queen mine has already produced over $100,000, and regular shipments to the Eureka furnace are again being inaugurated. The Queen is one of the many properties in this section that shows that mining pays—at least, in eastern Nevada.

SUMMIT SPRINGS DISTRICT.

New Discovery.—Cor. *Silver State*, Jan. 7: The new discovery of Smelser & Co. is about 12 miles from Stone House, on the C. P. R R., in a southerly direction from that place and on the east side of the range. The vein strikes north and dips to the west at an angle of about 50°, and crosses a low hill jutting out from the main range. The vein is about 50 ft wide on the surface, and all ore. I went down the incline shaft about 70 ft. It is sunk about the middle of the lead. The ore has improved with depth, and is much better at the bottom of the shaft than at the surface. All the rock taken from the shaft is strongly impregnated with ore, and Mr. Smith, the superintendent, has offered to pay all expenses incurred thus far for the ore on the dump. The ore is argentiferous gray copper, carrying considerable gold as well as silver. The company will start a level from the bottom of the incline and crosscut the vein, so as to find the wall and ascertain the exact width of the lode, and they do not want visitors until they have properly defined it. The ledge can be traced by croppings carrying ore, over 6,000 ft. Smelser's ranch is about a mile and a half south of the mine, and a large stream of water flows there. The range south is capped with limestone threaded with veins of galena, copper and silver, and covered with groves of juniper wood, and water is abundant. Mr. Smelser has made some expensive and permanent improvements at his place. He has built high dams and long levees which back the water on to a flat, forming a lake, from which he irrigates his extensive alfalfa and grain fields. From what I have seen I have come to the conclusion that Summit Springs will prove to be one of the most extensive mining localities in Nevada.

WILLOW CREEK DISTRICT.

Emma.—*Silver State*, Jan. 3: The Emma mine at Willow Creek, owned by A. H. Ruse, is producing some very fine-looking ore. It is opened by a tunnel to a depth of 60 ft, and the ore is quite different and much richer than it was at the surface. It is free milling ore, principally chloride, and is said to assay over $200 to the ton in silver, and $30 in gold.

ARIZONA.

Silver District.—Arizona *Sentinel*, Jan 7: Mr. A. Ragel received by last steamer a sample lot of mineral from his mine, the North Star, East Silver district. The ore is of high grade, and mostly milling. It is the same class of rock found in the Mandeville lode. Progress in the Silver Glance contract is a little slow at present, the boys having struck a stratum of very hard quartz. Foreman Walter Miller, of the Lost mine, was in town this week on a business visit. Mr. Miller reports everything flourishing at Silver district, and that the Lost and Black Rock mines are making a good showing. It is rumored that a contract is about to be let, to sink 250 ft on the Engineer mine. This property prospects well, and depth will place it at the head of the great ore producers of Silent. Reports from the Amelia, Poerman's district, are very encouraging, hoisting plenty of good ore from the main shaft, where the men are sinking night and day. The Castle Peak mine, near Antelope, is opening up in good shape. The shaft is now down 30 ft in good quartz, with a strong vein in sight. The rock carries gold, copper and silver, and runs exceedingly high in the former metal. Plenty of good copper glance is also being taken out. This promising property is owned by Chas. K. Lambie & Co.

Globe District.—*Chronicle*, Jan. 7: A gentleman who has inspected the Missouri mine, about 3 miles from the South Pioneer, says it is a large, well-defined contact ledge, over 12 ft in width, which can be traced upon the surface a long distance. At the bottom of the 40-ft shaft there shows a 2-ft vein of rich ore on one side of the ledge, about 12 inches on the other side, and a small streak of rich ore near the center, while the whole ledge matter carries mineral.

The Gen. Hooker.—The Gen. Hooker is located on Gold hill, within 1 mile of the Golden Eagle mine. A tunnel has been run 135 ft into the hill, cutting the lode 135 ft below its surface, cutting through vein matter of gold sulphurets and pyrites of copper, which will give an average assay in gold of about $20. The highest assay reached $55. The mine is in granite formation.

Old Dominion and Borva Copper Mines.—From examination made day before yesterday, we are able to state that work on both the Old Dominion and Borva copper mines is progressing rapidly and with favorable results. On the Old Dominion the tunnel is now 375 ft. The drift spoken of in our last notice, from the winze towards the main shaft, 65 ft in depth below the tunnel, now connects the two, and is in good ore the whole distance of 80 ft, increasing in quality every foot, the richest ore lying at the bottom of the drift. The exhibit shows an apparent solid cubic ore body commensurate with the workings. In the Borva the tunnel cutting the 12-ft shaft is now in 60 ft, with continuous ore from the shaft, a considerable quantity of the ore at the bottom of the tunnel beginning to resemble in appearance that of the rich ores of the Old Dominion. From the 110-ft shaft near the base of the hill the drift is now in 12 ft, and is being steadily pushed forward. Altogether both of these properties give promise of splendid results.

IDAHO.

Leesburg.—Idaho *Messenger*, Jan. 7: Mr. A. G. Clemour, Leesburg, has disposed of his interests in quartz mines in Leesburg mining district. The amount of money paid has not transpired, but is supposed to be a very handsome sum. We hope that the purchasers will put a force of men on their mines as soon as the weather will permit.

Mr. P. J. Kesley, Supt. of the Idaho G. M. Co. of Othonville, has resigned his position, and has been replaced by Mr. Chas. J. Barclay.

MONTANA.

Magna Charta.—*Inter-Mountain*, Jan. 4: Within the past few days the main shaft, upon which sinking has of late been very actively progressing, has attained a depth of 400 ft, and the station has been cut out. Yesterday a contract was let for the extension of the crosscut, and this morning work was begun. Both the north and south veins will be fully opened up. In the 300 level the middle vein is yielding fine ore and the levels on the north and south veins are also contributing liberally to the mills. The daily production of ore from the Magna Charta is about 40 tons.

Alice.—Everything is running smoothly at the Alice. The appearance of the ore body in the 700 level has undergone no change, the quartz being of good quality but very hard. In the upper workings of the mine the extraction of ore is proceeding as usual, the reserves still being immense.

Bell of Butte.—A very rich strike of ore is reported in the Bell of Butte. The ore body is said to be fully 8 ft wide, and still one of the walls has not been reached. Assays are high, as the ore shows a profusion of native and wire silver. The polite superintendent, Mr. Downs, is in excellent spirits over the new development, which he declares to be one of the most important ever made in the camp.

Stevens.—The Stevens is in much better shape than for some time past. In the east level of the west shaft, and in the west level of the middle shaft the drifts are being actively extended on good ore. A block of ore about 75 ft in length connects the workings from the two shafts.

Strike in the Legal Tender.—From Mr. Phil Saunders, agent of the Legal Tender Co., who arrived from Clancey yesterday, it is learned that one of the richest strikes ever recorded in the Territory has been made in the Legal Tender. In the main shaft, which follows the old vein in a vertical direction, a station was cut out at a depth of 188 ft, and no little surprise was occasioned when the workmen broke into a fine vein of ore, which appeared to their astonished gaze to be of fabulous richness. In all probability the ore body is but a continuation of that vein concerning the discovery of which about a month ago so much enthusiasm was expressed. The new ore body has a clear width of 12 inches, and seems to be almost solid horn silver. The strike was made on New Year's morning.

Butte District.—*Inter-Mountain*, Jan. 7: Mining operations actively and successfully continue in all parts of the Butte district, and those which are not now producing ore are being developed by vertical shafts from which cross-cuts will soon be extended to the ledges. On the Butte Original operations are confined to the sinking of the main shaft, which has now attained a depth of 320 ft. A considerable volume of water requires to be hoisted, but as the presence of a large supply of water is always a hopeful sign, and as the machinery employed is of sufficient capacity to raise all that comes into the shaft, no trouble is experienced. It is not likely that a cross-cut will be extended from the 300 station of the Butte Original, the intention being to sink the shaft 400 ft before any attempt is made to explore the ledge. At that depth some magnificent developments may by expected. On the Anaconda, cross-cutting from the bottom of the main shaft, which is 350 ft deep, continues with all possible energy, and the ledge is expected to be tapped within a short time. The Sheridan, which shows one of the richest ore bodies in the camp, is temperarily closed down on account of water, but will be started up again on the arrival of the pumping and hoisting machinery lately purchased, and which is now en route.

NEW MEXICO.

Smelter.—New Mexico *Mining News*, Jan 4: Los Cerrillos miners are complaining that the M. & R. Co. intended to fix their rates for smelting ore at unreasonable figures, and those of the mine owners who can afford to do so express the determination to wait until there is another smelter in the district and the charges are reduced by competition. If the complaints of the miners are well founded it is a stats of affairs very much to be regretted. The district is just at a point at which a little boost each as the M. & R. Co. can give it would make it boom, and anything like oppression will retard its progress very materially. It would appear that there will be enough work for the smelter to enable them to make money without asking heavy prices, in which case it will be to the interests of the owners of the works as well as the miners to be reasonable.

OREGON.

Water.—Jacksonville *Times*, Jan. 7: More rain is wanted at once. Sturgis & Co. of Jackass creek are still engaged in drifting with fair results. The water has run down again during the past week, and most of the miners are idle. Geo. Schumpf has sent a lot of fine ore from his ledge to San Francisco for assaying. Reed & Vickroy, of Forest creek, are running with reservoir heads and expect to make a good clean-up. DeLamater & Co. have their mines, on Coy flat, Josephine county, in running order, and are working night and day. Jacob Klippel and Frank Staab, of Poorman's creek, have everything in readiness and are about digging a new ditch.

Unfavorable.—Many miners fear that the present season will be an unfavorable one, owing to the lack of rain. There is time for a good run yet, however. Wimer & Simmons' locomotive lamp is at Crescent city, and as there is but little snow on the mountains, it is expected to arrive before long. Chas. Williams, of Pleasant creek called on us this week, from whom we learned that the miners of that district have plenty of water and are busy. Wm. Linville and Wm. Little have purchased a piece of ground on Poorman's creek, of L. Herling, we learn, and propose working it this winter. Thos. Carr and H. R. Boling, of Foots creek, were in town this week, from whom we learned that mining is again in *statu quo* there for lack of water, which is the case generally. The Cayote creek mines were sold last Saturday at Sheriff's sale, by virtue of an execution issued in favor of H. Kelly and against Ruhle *et al.* They were bid in by Capt. Kelly for $15,000. Another bid of $12,000 was made by D. H. Feathers in behalf of other parties.

Applegate.—Hansen & Berryman, of Applegate, are still engaged in drifting in the bank of the Applegate, near Kuhli & Bolt's store, and have struck another pay streak that promises better than the old ones. They often realize $15 a day to the hand, while washing the dirt.

Galice Creek.—F. B. Rodgers, who has been spending the holidays in the valley, returned to Galice creek Wednesday. He informs us that McElvey & Simmons' claim is being rigged up with plenty of hydraulic pipe and a "giant," which will be in operation in the course of a very few weeks.

Hogue Mt.—Skeeters & Co's mines on Hogue mountain, Josephine county, are promising very well. Recent prospecting denotes that they are rich, and of great extent. One box yielded nearly $4, after a very short run, and $1 worth of dust was realized from a single pan taken from the ground sluice. Sheriff Bybee is interested in this mine.

Bybee & Newman's claim near Waldo is paying very well, although they have not the requisite amount of water. They cleaned up their boxes after a short run, and realized $575. The ground sluice remains untouched, however, and there the best pay is supposed to exist. Mr. Bybee believes that a small ditch is all that is necessary to make it one of the best pieces of mining property in this section.

Science in the Public School System.

Schools of Art, Trade, and Commerce.

[Read before the California Academy of Sciences at the annual meeting, by Prof. George Davidson, U. S. Coast and Geodetic Survey.]

One of the subjects of deep interest that is now occupying those thoughtful men who realize the application of scientific results to practical industry, is the best means of incorporating the elements of this knowledge in the course of an ordinary education, so that it shall enter into and improve the character of our industrial products.

This idea has been quickened by a certain and formidable danger that threatens the higher manufacturing and mechanical industries of our country, in the great and commendable energy with which European nations are urging and extending their systems of special education; fitting the young to be better adepts in their several handicrafts; educating those who combine theoretical acuteness with practical application, to be foremen, masters and teachers; giving every reasonable assistance to the higher class of thought and aptitude.

It is no ordinary question of mere choice of routine; it comprehends the struggle for national supremacy in manufactures.

As our present system of public school instruction is utterly unprepared to meet the demands necessitated by such foreign competition, any change to remedy its defects must be vital and perhaps radical, and will meet with much illogical opposition.

We have always expressed the need of scientific methods in the higher and more thorough system of education, and certainly there must be a necessity for the introduction and application of such knowledge in all elementary education. Hence it seems to me that this Academy, both in its corporate and individual capacity, should not only maintain but express consistent views upon the subject.

One of the means of expressing the necessity for universal scientific education has been in the temporary establishment in different countries of the

Industrial Exhibitions

Of the manufactures and appliances of industry, and especially of those products which have mainly added to the wealth and prosperity of the nation.

Whilst this lacks depth and universality each exhibition has given impetus to individual efforts which have expanded and influenced the modes of production and the quality of the commodities.

It is deficient in generality because only a comparatively few persons can profit by consulting any special class of machinery or production. These few persons must already be fairly well skilled in order to judge of the relative merits of any process, because the time for examination is limited, and the opportunity for detailed instruction restricted and frequently forbidden.

Whilst these expensive national exhibitions have demonstrated their own inherent weakness as educational factors, they have suggested the better method of

"Beginning at the Beginning,"

And thence logically developing some system of education suited to the environment of each people and each country.

The very limited and tentative experimentation in Europe in the establishment of trade schools and art schools, has demonstrated their paramount necessity to the nation whose prosperity is mainly dependent upon the productions of handicraft.

Our acknowledged aptness and acuteness in invention has given us a certain position in the world-market of manufacture and trade, but we must yield to others the higher attribute of adding pleasure to the eye by combining beauty and gracefulness with usefulness. It is this combination which gives to France her superiority in the production of textile fabrics and works of art, and we unconsciously but assuredly help to support her factories and her schools of industrial teaching by purchasing at such high rates the output of her workshops.

England

Has already taken the alarm. Exhibition after exhibition confirmed the statement that in every department of manufacturing industry Continental Europe was abreast and even ahead of her in the make, style and finish of their goods. In the exhibition of 1851 no Englishman received a premium for design. Competition sharpened the inquiries of business men and manufacturers as to the cause. England's cruder products, made and fashioned almost by rule of thumb, were being supplanted by the more eye-satisfying products of Belgium, Switzerland, Germany, Austria and France. Her citizens, made rich through the great opportunities which her coal and iron had made possible, now begin to build and endow colleges for scientific and technological learning, even to the exclusion of classics.

Her far-seeing statesmen, her well-informed manufacturers and her scientific leaders have collectively given the warning, and are endeavoring to mold the educational system to meet the inevitable struggle for commercial and national supremacy.

Among ourselves, we unconsciously appreciate this situation, and tacitly acknowledge the

Need of Higher Finishing Skill,

By securing the services of technologists. In nearly all other countries, these specialists are native and to the manner born. In England this is partially so; but in the United States, we do not hesitate to scour other countries when we need some specially qualified workman. So true is this, that I know I am safe in saying, that within a very recent period, nine-tenths of the foremen in the workshops of this city were educated in the trade schools, or learned their deftness under a master of the trade in a foreign country; and certainly not more than one-tenth of the skilled workmen among our higher-grade industries have acquired their aptitude from home teaching and experience. I could enumerate many instances which have come within my professional ken and experience, but the enumeration would be invidious, as well as mortifying to our pride.

If, then, success is rapidly rewarding the

Systematic Teaching of Handicraft and Art

To the youth of other countries so that they control the best places in our workshops; if we acknowledge the superiority of many foreign productions, as is proved by the immense importations thereof; if we propose to increase our national prosperity, and acquire manufacturing, commercial and agricultural superiority; if we are met at the very threshold of our social fabric by the pertinent and penetrating question, "What shall we do with our boys?"—does it not strike you that we should learn more minutely what has been done at those industrial centers whence we call for skilled workmen, and whose workshop products are preferred to ours?—that we should profit by their experience?

The natural advantages are with the youth of America, as is shown by our inventive skill, by daring and successful engineering, by the restless mental activity of young life.

It would seem, therefore, that the youth of to day, who are to lead to-morrow,

Need a Different System

For guiding, developing and applying their faculties, from what now exists. This conclusion is fortified by the establishment of a limited number of special schools of technology in the Atlantic States, and the forced, tardy, and yet wholly insufficient introduction of science in the curriculum of some of our colleges. These advances have only made a start in the great centers of industry and population, and the public mind seems unfortunately to have accepted the long unchallenged assertion that a common school education is amply sufficient for the young American; and that his quickness and aptness will in some "royal way" fit him for any position he names. This is simply a monstrous mistake.

I earnestly believe in

Universal Education,

And in carrying it to its legitimate conclusions. It is a necessity of the age; it cannot be set aside if we would. But I believe in its being so construed that the blacksmith shall understand the character of the material and tools he is using; that he shall have skill to use neither too much nor too little metal; and that his productions shall have the best shape for strength and beauty combined. That the joiner shall know the peculiarities of the woods and tools he is working with, and that he shall be shall use them to the best advantage. That the weaver shall know how to produce the best goods for wear, as well as those wonderful creations of textile fabrics which are a marvel to the eye of taste. That the wood turner, the metal worker, the instrument maker, shall, by deftness of hand and accuracy of eye, more than rival the artisans of other countries.

The present school system has

Spoiled Tens of Thousands of Artisans;

But it has in a measure only repeated the experience of other countries. To state its results mildly, it may be said to create a disposition in the pupils to avoid those occupations which demand manual labor, and to seek those easy berths where somebody else does the work. It creates a false standard of manliness. It covers a multitude of incongruous subjects, and lacks completeness and thoroughness in any one of them.

To those who have the capacity and the support to follow its higher courses, it does offer a more apparent completeness and thoroughness. But I contend that from the standpoint of availability to meet the exigencies of daily life, from the standpoint of national superiority in manufactures, mining, commerce, engineering and agriculture, it is absolutely necessary that the system should be fitted to the needs and wants which the sharp competition for such supremacy demands. It is not the struggle of one man, or of one city, or of one State against a friendly neighbor; it is the battle of industrial life of 50,000,000 people—of 100,000,000 within a generation—against the experience and more readily molded compact populations of Europe, guided by keen manufacturers, special technologists, trained educators, and broad-viewed statesmen.

I do not deprecate the wisdom of our really great men in education, in statesmanship, in science, in manufactures—on the contrary, I hope to see their wishes and efforts come to fruition. You have but to consult the reports of our Commissioners to the Paris Exposition of 1878 to be satisfied of their thorough knowledge of the situation, and of the earnestness of their awakening call. If I were, however, to reproduce their criticisms you would pronounce them cynics; nevertheless they were the representatives men in education, in art, in manufactures; they were alive to the progress around them; they were lifted above provincialism to the higher plane of nationality. They gauged the active and the passive nations—the one colonizing the earth through ship, machine and free speech—the other enjoying the delicous listlessness of drifting down stream.

I may but refer to

What Other Countries are Doing

To afford such practical education to their youth as will give them pre-eminence in their different handicrafts.

France has her school workshops, which are established upon the proposition that whatever be the actual fixed calling of the youth, there is a certain number of leading subjects of education common to all, and to which the instruction intended for artisans should conform; and this course is combined with a continuance of regular school instruction, and perhaps it may not be imposing upon your patience to enumerate the subject matters included in

The General Programme

Of one of the most successful workshop schools in Paris.

1. The continuance of school instruction, somewhat modified from its present type; the maintenance of examinations which shall give the right to the certificate of primary education.

2. Study and management of raw materials.

3. Drawing from patterns in relief, modeling, molding, sculpture upon soft stone, marble and wood, graphic drawing and ink shadings.

4. The practice of general processes and tools; work at the bench, at the forge, at the lathe, at the vise; elementary specialization when the pupil has in view a particular industry.

5. General technical education and specialization of that part which bears on the chosen trade; book-keeping; industrial and commercial geography; first elements of economy.

6. Delineation with scale and dividers of a piece of finished work or a machine; working plan on a given scale; sketch or free-hand drawing; reciprocally, execution after a working plan on a given scale, or after a rough draught.

7. Invention, plotting, execution of simple plans.

8. Morals, duties of men, the child, the laboring man, the man of property, men in mutual relations, the head of a family, the citizen, and the country.

9. Habits, personal order, order in tools, order in labor, order in the shop, order in accounts, order in thought, spirit, and hence in conduct.

Upon this basis are planned the different workshops for different trades; the allotment of practice and study; and all the minutia of detail which a systematic organization demands.

Combined with this system are the

Journeys of Instruction,

Which embrace the visiting of workshops, collections and works of construction, upon which reports are made by the pupil visitors. In these journeys a specified number of pupils are selected from certain schools on account of their diligence and proficiency, to visit the great centers of industry—extending even to adjacent countries. The details of all such excursions made out as reports by the pupils, are exceedingly interesting and instructive.

There are numerous technological schools throughout the republic; a national school of Horology at Cluses, and commercial schools and schools of navigation at Havre, Marseilles and other cities.

Moreover, the adult population is not forgotten; and besides the encouragement given to public adult instruction, there are special free schools for adults, particularly for the teaching of drawing, and evening schools to meet the cases of those who appreciate the need, and now first find the opportunity for education.

The results of

These Different Classes of Schools

Has been remarkably instructive and encouraging, and will gradually lead to a thorough and more homogeneous system throughout the country. At present, the plan of education is but emerging from the control of the clerical party, and coming in contact with the realities of active business life.

In Russia,

The great technological schools of Moscow and St. Petersburg have shown their capacity and their influence, and the workmanship of the pupils created astonishment and admiration among our instructors and mechanicians who examined their exhibits. They rival our best efforts.

In Germany,

In Austria-Hungary, in Switzerland, the Netherlands, Belgium, and other countries, we find that the trade and art schools are gradually but assuredly raising the character of the artisans' work, and necessarily adding to the mercantile value of their productions.

England

Has awakened to the necessity for a better and more adaptable education to her artisan classes, and for a more cultivated taste and execution among her skilled workmen. For years she rightly considered herself at the head and front of manufactures, but little by little the truth dawned upon the minds and pockets of her manufacturers that the progress of foreign workmanship could not be attributed altogether to the greater industry and lower wages of the workmen, but that the cultivated intelligence derived from attendance and study at trade and workshop schools, and technological institutions was the secret of successful competition. Those immediately interested saw that the same character of education must be imparted to the British workman; but in a country so conservative of old customs the greatest tact was necessary to introduce new methods.

But that most sensitive of all nerves, the pocket nerve, has quickened the commercial and manufacturing instinct, and to-day the mystery has become a conviction.

The first outcome was the establishment of the

Leeds Textile School,

Founded by the munificence of the Clothworkers' Company of London, but owing its existence to the pressure of the Leeds manufacturers. Then followed the Glasgow Technological school, profiting in its organization by the experience of the Leeds school. Later, the example was enthusiastically adopted by Bradford; and elsewhere the idea has germinated, and classes and schools have been formed. In no direction is there any indication of aught but success; the advantages of these schools are earnestly and even enthusiastically embraced by workmen.

And so might the story be continued. I have only made the matter suggestive for action.

But I cannot refrain from quoting the warning of others. The

U. S. Commissioner of Education to Paris In 1878, says:

"We are behind Europe in the education of the powers of observation and manipulation. The sharp competition of the different countries of Europe demand the cultivation of the eye and the hand, and long practice has given an aptitude and ability transmitted perhaps as an inheritance, and so become a second nature. But we certainly need to do a great deal more in this direction, and we cannot begin it too soon. If the brain of man conceives the strategy by which we master nature, it is by the eye and the hand that the real victory is to be achieved. A large amount of the educational effort of this country is directed to sharpen the wits and quicken the inventive genius of our people, but our lack in bodily training will before long make itself painfully evident."

Of course we have not forgotten the existence of the few higher

Technological Institutions of the United States,

Nor their high rank and efficiency, but my especial object has been to insist that in our ordinary public schools we have not professed to reach that point of necessary useful knowledge, much less its application, which our status as a manufacturing and commercial nation demands.

You will ask how our youth are to receive that instruction which shall fit them for successful competition in the struggle for national superiority in manufactures and commerce.

The answer cannot be given impromptu; we must, to a certain extent, be guided by the experience of other countries, and must comprehend their political and social organizations for comparison with our own, to understand what we shall adopt and what modify. All their systems of trade, workshop, and commercial schools have grown up with local constrictions, and yet have a national object in view. They had many serious obstacles to overcome, perhaps more than we have, for they had less freedom of personal action and thought. We have more of individual independence, which may aid in developing special schools for trade and art, more particularly in those centers demanding them.

Nevertheless, whatever be the ultimate character of our common education, there are certain

Fundamental Branches of Knowledge Underlying all Trades

And productions. These come under the general designation of science; and the elementary laws thereof, and their practical application to the manufactures, agriculture and mining of this country are not beyond the scope of our present public school system; nor beyond the readily assimilative power of our pupils. Whoever has come into contact with our youth will fully bear me out in that conclusion. And whoever has had a varied experience with young men, grown up from the ordinary public schools, will be astonished at their lack of knowledge of the fundamental principles which underlie their workmanship. They have in general an amount of undigested and incoherent material which their teachers have christened knowledge, and which their inexperience considers applicable for any and every pursuit. For example, one of the commonest wants of pupils throughout the country is their inability to draw upon paper any plan of roads with which they are familiar, any sketch of the plainest machine of every day use, much less to convey any idea which looks to an improvement or an invention in machinery or construction. I feel perfectly safe in saying, from my experience, that not one person in a hundred from our public schools can give you an off-hand drawing of any plain object, with any approachable degree of accuracy as to relative dimensions or perspective.

This is not the fault of the pupils who, as a rule, are naturally quicker and brighter than the youth of Europe; but it is the inherent weakness of the system, and a painful evidence that we are not doing our duty to our boys.

Again, you ask,

Can these Deficiencies be Corrected in our Present System?

I answer, yes; in a measure. Time is required to mold and develop the proper system of trade and art schools, of evening and navigation schools suitable for this side of the continent at least; and pending this, we can certainly engraft upon our methods the proper study of elementary sciences, and especially connect

therswith the free hand drawing which is the *sine qua non* in every school of the active nations of Europe. Our youth who are to build up the industrial supremacy of this country need not be crammed with foreign languages, which in a few years must be pressed aside before the irresistible progress of the English-speaking races; and it is a thousand times better that the boy who is to honestly earn his livelihood as an artisan, shall be a fair draughtsman than a fair fiddler. If his special talents point to music, then let that faculty be thoroughly cultivated; but do not waste means in spoiling a good carpenter, or in endeavoring to misdirect special aptitude. The classics, music, and the fine arts have their high places and their humanizing functions in modern civilization. So has the bridge-builder, the miner, the engineer and the contractor.

Life is too short for us to repair the errors of early education; the State loses by the misapplication of talent. We need not wilfully throw our wealth into the depths of the Pacific.

There are many

Important Conditions Attached to this Subject

Of science-teaching, and of trade and art schools, especially when we contemplate how extensively great corporate bodies are gathering into their hands the manufacturing processes of the country, and apparently swallowing up individual efforts; but each year the demand for skilled labor increases, and we must meet the difficulties of the problem as the number of factors is increased. We may never see very far ahead into the unknown—we should never be one step behind the requirements of the present.

I cannot, however, enter upon the consideration of the many actual and speculative phases involved and which are intensely interesting. I have simply endeavored to do a part of my duty as a citizen, and as a member of this Academy, in calling attention to the absolute necessity which exists for properly educating and fitting our youth for the duties which will be demanded of them in the struggle for national supremacy in material wealth.

A New Furnace.

The Santa Catarina Copper Co. is a corporation recently organized among the strong capitalists of New York and Boston by Dr. S. K. Kane, who purchased a group of copper mines in the Santa Catarina mountains, Old Hat district, which are said to equal the best mines yet discovered in the Territory, both in the quantity of the ore and its percentage of metal. Three thousand tons of ore is now in sight and on the dump ready for the furnace, that will give over 25% in copper, besides considerable silver. Enough has been developed to warrant the erection of a furnace, and the Superintendent, Mr. Walter B. Scott, formerly with the Huachuca M. and M. Co., is now in San Francisco selecting furnaces and the necessary machinery to work the mine and reduce the ore.

The furnaces will be erected at the mines, where a good supply of water has been obtained and plenty of wood secured to supply the furnaces for years to come.

From the mines to the San Pedro river, 15 miles, the work of constructing a road has commenced. Ninety men are now engaged in the work, and 50 additional men started this morning to build the road. When the San Pedro is reached the company have not yet decided whether to ascend the river to Benson or build a road down the stream eight miles to connect with the existing road to Tucson. In determining this question, much will depend upon the encouragement given by the business men of this city in securing an improvement in the condition of the road. Benson is the nearer railroad station of the two, yet Tucson possesses other advantages. A little exertion and united action by the business men of the city can secure for Tucson the benefits arising from the very large business of this company and of others which will soon begin operations in that vicinity.

It is expected that the furnace will begin its work of smelting in less than two months, and from the capacity of the mine and the quality of ore, a steady stream of bullion may be expected to flow and monthly dividends follow with gratifying regularity.—*Arizona Miner.*

History of a Mill.—Most of the early residents of this part of the State will remember the old Metropolitan mill, formely located at Shermantown, White Pine county, in which, during the early excitement of that district, a large portion of the rich ore taken from the Eberhardt mine was worked. This was during the years 1868 and 1869. Some time in 1871 or 1872 this mill was taken down and removed to Eureka, and called the Lemmon mill. It has been here ever since, and it should be said, for the sake of accuracy, that the mill was not new at Shermantown. It had been transplanted there from Hot Creek, whither it will now return. This completes the circle. The mills of the gods grind slow—there are other mills that grind fast—and there are still other mills that don't grind at all. The Lemmon mill may be capable of some good grinding yet; but, if so, it will probably need plenty of time as the mills of the gods.—*Eureka Sentinel.*

The San Francisco Mining and Scientific Press, in its issue of the 17th inst., contains cuts of several points in Arizona, and a vast amount of information relative to our Territory.—*Arizona Gazette.*

Useful Information.

A Station Indicator.—Many inventions have been devised to announce to passengers the successive stations on a railroad by some simple act of the engineer or conductor, but hitherto with very little success. It is now, however, stated, on what appears to be very good authority, that practical success has been reached in this direction. This new indicator is the invention of Mr. E. S. Boynton, and is made by the Wheeler & Wilson Sewing Machine Co., of Bridgeport, Conn. At each end of the car is an oblong box containing the names of all the stations on a ribbon. Over the top of the box is printed "next stop," and the name of the station at which the next stop is to be made shows through an opening in the door of the box. The shifting of the names is controlled by the engineer on the locomotive. There is a small rubber bellows on each box which is contracted when the engineer makes a vacuum; this works a lever that raises a platform on which the band containing the names of the stations rests. An ingenious catch prevents the hand from slipping backward, so when the platform falls again by the bellows filling with air, the hand must fall to the front, thus shifting the name of the station passed to the next one above it. The engineer has a small indicator in the locomotive cab, bearing the names of the stations, and he thus knows whether the apparatus is set right. The indicator can also be worked by the Westinghouse automatic brake cylinders, or by a bell cord. The device does away with the train hands calling the names of the stations, and the names being printed in legible letters are more easily made out—by a person who can read—than some of the almost unintelligible ejaculations of a brakeman. The cost of the apparatus is about 1% of the cost of the car, and the inventor says the cost of maintenance will be very small.

Reversing the Wheels. — Experiments lately made at Blackburn with a train made up in imitation of that of the express which ran into the train standing in Blackburn station, to test the statement of the driver that he reversed his engine as soon as he found the brakes did not check his train, are of some interest, though they elicited the fact that the reversal of the engine of a train running at a high velocity has but a very small effect in reducing the speed. A high speed was attained, and the engine was reversed a quarter of a mile before reaching the station, but the train ran through the station at about 20 miles an hour, and had to be stopped by the brakes. Locomotive driving wheels, when running the reverse way, are not effective in stopping a train. The experiment shows how little can be gained by reversing an engine under such circumstances.

Bullet Making.—The manufacture of bullets is not so simple as it used to be. At Woolwich, the melted metal is poured into a receiver, and as soon as it solidifies, but before it is cold, it is forced by hydraulic pressure through cylindrical holes in the form of long strings. This process is to prevent the formation of air bubbles in the bullet, which would cause it, when fired, to swerve from its course. The leaden strings are thence carried to the bullet-molding department, where they are cut into lengths and rounded, then shaped in one machine and finished in another. They were formerly plugged with wood, but now plugs are prepared from a special powder, which solidifies after being pressed into form. For sharpshooting, great care is observed to obtain bullets of uniform size, shape and weight, and to use powder of a known explosive force.

To remove caustic stains—or such as will not yield to ordinary appliances—1st, take of chloride of mercury two drams; hydrochloric acid, two drams; dissolve. This must be applied to the stain with a camel's-hair pencil, and the linen, paper, etc., immediately plunged into water, when the stain will be removed. 1st it be afterwards dried in the sun. 2d, if a small piece of the iodide of potassium is rubbed on the part (which must be previously wet), it will immediately decompose the blackened oxide and convert it into the iodide of silver, which is soluble in water, and consequently may be discharged by washing. The above process will answer equally as well for linen, muslin, etc. Hot water dissolves the iodide much quicker than cold.

Cold Storage.—The increasing use of cold storage for perishable food stuffs, which are apt to be scarce at certain seasons, is one of the characteristics of the time. Last summer, when fresh eggs were plentiful and cheap, a gentleman in Chenango county, N. Y., stored in a mammoth cooler some 5,000 barrels of eggs. Now they sell in New York as "fresh laid" eggs, at a large profit. As the eggs are removed, the cooler is filled up with ducks and other fowls to be sold next spring.

Recovering Soap from Soapsuds.—At Ivry-sur-Seine, a manufactory of toilet soaps has prospered for a considerable time. The soap, which is perfumed with oil of roses, is obtained from the treatment of washing water in Paris, which, instead of being run into the sewers, is now collected in casks.—*Druggists and Chemists' Circular.*

The Action of Solder.—A correspondent of the *Scientific American* asks: "Why does solder melt under the soldering 'iron,' when it will not under real iron, and why is it necessary to have the tool coated with tin? Does it act as a flux?" The reply is given as follows: "Solder will melt under any hot iron, but unless the iron (or other metal) is perfectly free from oxide, perfect contact between the melted solders and the 'iron,' which is essential, cannot occur. When properly cleaned and coated with tin (or solder) the coating prevents re-oxidation of the metal while heating, and the fluid metal follows and can be directed by the tool.

A New Source for Glucose.—A company has been formed in Philadelphia to manufacture glucose from cassava, the plant from which tapioca is derived. Taking the average yield of corn—from which glucose is now made—at 35 bushels to the acre, the glucose product is only about 1,000 lbs. to the acre, while the average product from cassava, which yields 10 tons to the acre, would give a return of more than 5 tons of glucose. It is said that sometimes fully 20 tons of cassava is obtained from an acre of ground in Florida, which would double the above named yield, or give the large amount of 10 tons to the acre.

For Microscopists.—To produce animalcules for microscopic examination and study the *Scientific American* suggests the following process: Mix wheat flour into thin paste with a little yeast and cabbage water, and let it stand in a warm place until it becomes quite putrid. Mix this with water (or a little common vinegar) and examine. The time required to prepare such a paste under favorable conditions need not exceed three days.

To Clean Marble.—Mix one quarter of a pound of soft soap with the same of pounded whiting, one ounce of soda and a piece of stone blue the size of a walnut; boil these together for 15 minutes, and then, while hot, rub it over the marble with a piece of flannel, and leave it on for 24 hours; then wash it off with clean water, and polish the marble with a piece of coarse flannel, or, what is better, a piece of an old hat.

Good Health.

The Tape Worm.

Most readers know that the domestic pig is subject to a disease known as "measles," in which the muscles are more or less filled with *cysts*, which render the pork unfit for food; but I think few are acquainted with its cause.

Man, it is well known, is occasionally infested by a parasite—the so-called "tape-worm" (*Tænia solium*)—which may be described as having a tape-like body of varying length, with a differentiated "head" or *scolex* at one extremity.

This apparently single animal is in reality a colony of mothers and daughters, the scolex being the parent of all.

This "head" is provided with a *rostellum*, or, as it might be called, proboscis, encircled by a crown of hoods, below which are the suckers; each segment added to the scolex is a complete individual containing a complicated and perfect reproductive system.

The last segment—*proglottides*—which are filled with eggs, break off at intervals, and either the eggs are set free within the intestines of their host, when they are passed out with the fæces, or the segments themselves are evacuated.

The tape worm feeds on the juices of the bowel by absorbing the nutriment through its skin, and does not appear to seriously inconvenience its host in any way. In Abyssinia *tænia helminthosis* is constant and general; indeed the animal is there regarded as a sort of hygienic agent and cultivated rather than discouraged, yet the people are healthy; certain it is also that wild animals, almost without exception, harbor at least one species of tape worm as a natural condition.

But what has this to do with "measles?" Now to the point. Let us suppose one of the before-mentioned eggs taken into the stomach of a pig, either by its eating the excrement of a person affected or through the water or air; here it hatches, not into a tape-worm, but into an animal of oval form, transparent, contractile, in the middle of which are six stylets arranged in pairs; with these it cuts its way through the tissues until the muscles are reached, when, having arrived at its destination, it stops burrowing and surrounds itself with a sheath.

Here the stylets atrophy, a new and quite different crown of hooks is produced, and the parasite becomes a *cysticercus* or vesicular worm, the cyst being about the size of a hazel nut. This constitutes "measles;" the exhaustion or even death attendant on the disease is caused by the scores, hundreds, or even thousands of animals boring through the tissues; once encysted there is no further suffering or danger.

The cysticercus remains encysted for months or years, or until the piece of flesh enveloping it *is introduced into the stomach of man*, in which case it instantly quits its torpid condition, leaves its sheath, makes its way to the intestine, where, attaching itself by its suckers and hooks, it grows—or rather reproduces—so rapidly that in a few weeks a tape worm of several yards in length is formed, which reproduces eggs, and so *ad infinitum*—from pig to man, from man to pig.

Should the eggs be introduced into man himself or animal other than the hog, the cysticercus penetrates the tissues in the same manner, but it is "not at home," and instead of resting in the muscles it makes its way to other organs, such as the brain, heart, or eye, where its presence has caused in man several instances of insanity and death. Should a piece of meat containing a vesicular worm be eaten by a pig or animal other than man a *tænia* is developed, but it also is "not at home," and does not attain its full development.

Both eggs and cysticerci are killed by a temperature of 200° Fah., so there is no danger in eating well-cooked pork, even if it contains cysticerci.

To prevent hogs contracting "measles" it is only necessary to prevent them having access, either through their food or water, to the secretions of man, and they will not suffer.

Throughout the genus *Tænia* we find this duel life; for instance, the cat has a tape worm, the cysticercus of which she gets from the mouse, and the dog one which he obtains from the sheep.—*Scientific American.*

Sex Development in Nature.

The sentimental pretensions put forward by a political school which holds that woman is intellectually the equal of man, give a character of actuality to the question of the comparison of the sexes. This question, which it has been the custom to treat from a metaphysical point of view, is to us purely anthropological, or rather zoological; for we propose to show by characteristic examples borrowed from the whole animal kingdom that sexuality undergoes the same evolution in all species, including the human species. The female surpasses the male in certain inferior species. The males are smaller than the females among many cephalopods, and among some cirripeds. With a few exceptions the superiority of the females prevails among the annelids, and among certain articulates, as bees, hornets, wasps; and female butterflies are larger and heavier than males, a difference being observable even among the larvæ. A like superiority of females may be observed in many fishes, as in the cyprinoids, and in reptiles. This is, however, no longer the case among the superior vertebrates. The males of birds and mammals are nearly always superior to the females.

To sum up, the two sexes, at first unequal in consequence of the superiority of the female over the male characterizing the lowest species, become equal among species a little more elevated in the animal scale, and become unequal again in consequence of the pre-eminence of the male over the female, which is observed in all the higher species. The supremacy of the female is, then, the first term of the evolution which sexuality undergoes, while the supremacy of the male is the last term.—*Popular Science Monthly.*

People Who Whine.

There is a class of persons in this world, by no means small, whose prominent peculiarity is whining. They whine because they are poor, or if rich because they have no health to enjoy their riches; they whine because they have no luck, and other's prosperity exceeds theirs; they whine because some friends have died and they are living; they whine because they have aches and pains, and they have aches and pains because they whine; they whine, no one can tell why. Now, a word to these whining persons: First, stop whining—it is of no use complaining, fretting, fault-finding and whining. Why, you are the most deluded set of creatures that ever lived! Do you know that it is a well-settled principle of physiology and common sense that these habits are more exhausting to nervous vitality than almost any other violation of physiological law? And do you know that life is pretty much as you make it? You can make it bright and sunshiny, or you can make it dark and shadowy. This life is meant only to discipline us—to fit us for a higher and purer state of being. Then stop whining and fretting, and go on your way rejoicing.

Salt in Diphtheria.—In a paper read at the Medical Society of Victoria, Australia, Dr. Day stated that, having for many years regarded diphtheria, in its early stage, as a purely local affection, characterized by a marked tendency to take on putrefactive decomposition, he has trusted most to the free and constant application of antiseptics, and, when their employment has been adopted from the first, and been combined with judicious alimentation, he has seldom seen blood poisoning ensue. In consequence of the great power which salt possesses in preventing the putrefactive decomposition of meat and other organic matter, Dr. Day has often prescribed for diphtheritic patients living far away from medical aid, the frequent use of a gargle composed of a tablespoonful or more of salt dissolved in a tumbler of water, giving children who cannot gargle a teaspoonful or two to drink occasionally. Adults to use the gargle as a prophylactic or preventive, three or four times a day.

It is now thought probable that Iroquois and Foxhall will try conclusions in the spring over the Newmarket course, Eng.

Passing Events.

In this issue of the PRESS we give considerable space to the subject of technical education, publishing the very full address of the President of the Academy of Sciences, and also an abstract of Mr. Jno. Richards' lecture, both kindred subjects. We are glad to note the interest which is awakening in this direction, feeling sure that it will beer fruit before long.

The weather for the past few days has been clear, cold and dry—just the opposite of what we want at this season. Even up in Oregon they complain of lack of water.

The Gold Run suit still continues, testimony being taken daily. We give in another column an abstract of the most important testimony elicited recently.

A glance over the mining situation on the coast shows it to be more highly prosperous elsewhere than in California. This, however, is due entirely to the litigation on the debris question. When this shall be definately settled we cannot, of course, say. The Government is moving in the matter, however, and there will be a solution before long.

ANOTHER EASTERN "PROCESS."—The New York *Sun* of the 1st inst., in a long and amusing article on the debris question in this State, apprehends that "the business of extracting gold by hydraulic pressure, which is now prosecuted on a vast scale, might result in serious injury to the farming lands and natural waterways of the State." This new process of "extracting gold by hydranlic pressure" should not be confounded with the lead-bath process about which the Eastern papers were lately so enthusiastic; for, after carefully studying the minute description given of it by the *Sun*, it becomes almost certain that something analogous to the piping system is meant.

Drift Mining.

Prospecting.

Surface indications of the presence of an old channel are not always to be found. Many of the best drift mines at present worked, and nearly all of those now worked out and abandoned, were found by following the surface placers in the ravines and on the hillsides, up to what may be termed the line of disappearance of river-washed gravels and gold. This line is the line of separation of the country rock and the overlaying lava or cement, and is often a seam of this same river gravel of varying thickness. Where this seam of gravel is of considerable thickness (and in hydranlic mines it often forms banks 200 or 300 ft. deep), it is usually a channel entrance; that is, the place where a buried channel crossing the divide comes to the surface and is broken off and washed away by erosion. Sometimes a depression in the line or upper edge of the country rock still further indicates the presence of an entrance, but this is not general or to be relied on. It often happens that indications can be found on the opposite side of the ravine or canyon of an entrance, and continuation of the same channel. Not considering the deep and extensive banks of gravel which are more particularly the province of hydraulic mining, those comparatively thin seams of gravel, deeply covered by cement and lava, are peculiar to drift mines.

These Gravel Seams

Are not of necessity confined to a definite channel, as the old streems left or overflowed their beds, carrying drift gravels and sands wherever their waters washed. They nearly always contain gold, but rarely enough to pay for the working, except in a channel or at a channel entrance, where they are generally extremely rich.

Where a channel runs parallel to and within a divide, no entrances or signs of entrances can be found. In such instances they are either discovered by accident in working other channels, or their existence first guessed at, and tunnels or shafts made, exploring their supposed location. The pitch of the bedrock is some guidance, but is not necessarily conclusive, as will be further explained. A channel is often found in one mine by aid of data from its occurrence in an adjoining mine; the course of the channel, its grade, width, and character of the gravel being the principal factors employed.

The possible

Location of a Channel Being Determined.

Exploration, to ascertain whether or not it contains pay gravel, and the location and quantity of it, is made, either by tunneling or by a shaft. If what is supposed to be the entrance to a channel is found, a tunnel is commenced some distence below the seam of rim gravel, as it is termed, and run on a light, natural drainage grade, either till it comes into gravel or is supposed to be beyond the rim rock, at which point an upraise or winze is made to the surface of the bedrock and overlying gravel. This upraise is usually at right angles to the line of the tunnel, and inclined at considerable pitch. From it, drifts are run on the bedrock in several directions, and gravel taken out and prospected. The course, width and grade of the channel are determined as near as can be from the little work done.

The So-called Rim Rock

Is a peculiar feature of all the fragmentary buried river beds. If the surface of the bedrock he followed inward at the entrance to a channel, it will be found to rise for some distance, and then to descend till the bed of the channel, in its undisturbed position, is reached, thus forming a natural rock wall across the bed of the old stream. This wall or rim must of necessity have been formed subsequent to the covering up of the channel with lava and the diversion of its waters, and was, in all probability, coincident with the erosion of the present streams.

The inciting cause was doubtless the swelling and expansion of the bedrock, relieved of the weight of the greater portion of the gravel and cement overlying by erosion, and assisted by atmospheric influences. Many of the prevailing country rocks, principally various forms and kinds of metamorphic slate, have great tendency to swell and rise. In some of the drift mines, considerable difficulty is experienced in keeping tunnels and drifts open, owing to this swelling of the rock. Not only is there a rim to the channels, but the bedrock of almost every lava-capped mountain shows the same peculiarity, in greater or less degree, the surface sloping inward from every side. The effect of these rims is to give the sections of old channels a basin-like form, this peculiarity being so marked and general, that the miners of a quarter of a century since, and before the advancement of the channel theory, prospected for "basins," not channels. Single mountains containing a fragment of a buried channel have been worked, and the rim found to extend entirely around, with no opening; thus forming a quite regular and perfect natural basin.

Tunnel Running

Is quite expensive, and where the depth of cement and gravel is not supposed to exceed 150 ft., a vertical prospect shaft is often sunk. Such a shaft can be made circular and only large enough for one man to work at a time, requires little or no timbering, needs no hoisting machinery but a windlass, and costs, according to the hardness of the cement and gravel, from $2.50 to $12 per foot. Drifts are run from the bottom of this shaft on the bedrock, and the necessary facts regarding the gravel and channel determined. Prospecting by shaft has the advantage of comparative cheapness, exploring much more ground with the same expenditure and in less time, but is uncertain in that the influx of water may be so great as to be beyond control, thus preventing the bedrock being reached.

In Prospecting for a Channel,

The location of which is suppositious, a shaft is generally preferred, as several may have to be sunk before it is found or the work abandoned. The cost of one or more tunnels exploring the same ground would usually be much greater. Shafts sunk for this purpose are constructed somewhat more thoroughly, and usually provided with hoisting and pumping machinery.

Permanent Working.

A drift mine is invariably worked through a tunnel wherever practicable, and the proper location and construction of this tunnel is of the first importance. On it often depends success in the working of the mine. The previous prospecting should furnish the necessary data for running this tunnel correctly. The entrance is usually in one of the small ravines cutting into the divide or mountain, two advantages being thus secured; the tunnel is made as short as possible, and the most favorable natural facilities for washing are obtained. The tunnel should be entirely in the bedrock, and its first direction so as to bring it under the nearest point of the channel; from thence it is run in the line of the channel as rapidly as developments are made indicating the course. To keep the tunnel in the bedrock, its entrance must be much lower than the channel bed. How much lower, is dependent on the grade of the channel and its flow, as regards the direction of the tunnel, the grade of the tunnel, and the length of the ground it is intended to work. All of these factors, excepting, of course, the grade of the tunnel, are at the commencement of the work only approximately determined. It is better to have the tunnel much too low than a little too high, so a very liberal allowance is usually made to cover possible errors of calculation from uncertain information. If the first tunnel is too high, it often necessitates the running of a second and even a third tunnel lower down.

The usual dimensions of this main tunnel are: Height, 6½ ft. clear; width, where untimbered, 5½ ft. at the bottom, narrowing and arching at the top; if timbered, it is between timbers at the bottom 5½ ft., and at the top 3 or 3½ ft. Variations from these dimensions occur, but they are, nevertheless, the most general that can be given.

The tunnel is run into the mountain on an ascending grade so as to secure natural drainage and the assistance of the force of gravity to run the loaded cars out. Much variation is to be found in the grades of different tunnels; ½ inch and ½ inch to a rod, being among the least employed, and from these up to grades of three inches, four inches and even more are used. In general, the lighter the grade the better. The kind of car track employed can be allowed to control the grade within certain limits.

Wherever the rock in the tunnel has a tendency to cave, slide or swell, it must be timbered, and, if necessary, lagging put in on top and at the sides. Timber roughly squared with the axe is generally employed. All of it required in the mine is usually cut, dressed and delivered by contract; 8, 10, 12 cents, or thereabout, being the cost of a single timber, and lagging costing all the way from $20 to $40 per thousand. Pine, spruce, fir and cedar from the forests which cover the mountains, furnish the supply, and enough can usually be obtained from the surface ground of a mine to supply it.

(TO BE CONTINUED.)

Men Engaged in Hydraulic Mining.

In the Gold Run debris suit G. G. Blanchard was examined as to the number of persons engaged in mining along the American and its tributaries, the quantity of material displaced by their operations, etc., and testified: They all tailed into the most convenient places; each miner displaced about 10 cubic yards of material per day; think there were from 15,000 to 20,000 miners at work in Placer county in 1851-52-53; the displacement by each miner would be about 15 cubic yards per day; there is considerable seem mining now done in El Dorado county; in 1861 there were about 15,000 persons depending on mining in that county; there are now perhaps 10,000; prior to 1862 there was probably 50 times as much material removed as since then; the earth removed between 1848 and 1862 was light and of vegetable mold; most of the heavy material mined in later years is still in the vicinity of the mines; no man can tell how far any particular kind of material would be carried in suspension in the South Fork; 10% of the material at present mined in El Dorado county would not go 30 miles from the mine; some of the lighter vegetable mold might reach Sacramento; the natural wash in the river in El Dorado county is now more than 25 times as much as from all the mines; the tailings from the mines are saved wherever possible; it makes the best land in the county; about 1,000 acres of land have been thus made, from 2 to 10 ft. deep; it will raise what the natural land will not; the blue cement rock makes the very best sort of land after it decomposes and crumbles.

The Debris Suit.

The Gold Run suit still progresses at Sacramento, many new witnesses being examined. James Marshall, the discoverer of gold in California, was one of them, and said that the whole Sacramento valley was flooded in the winter of 1845-46. He was told at that time by the Indians and those who had resided here in 1830, that during the winter of that year the entire valley was deeply submerged, the only land visible in the valley being the Buttes. The highest water he ever saw in the American river, at Coloma, was in the winter of 1861-62. Evidence along the banks, near that town, shows that prior to 1848 the river at some time had been two or three ft. higher that it has been since that time.

Hon. Niles Searle, among other things, said: The great bulk of litigation brought before me while I was District Judge, was what is termed mining litigation. The habit of the miners of Plumas, Placer, Nevada, Yuba and El Dorado counties, where I have lived, is to wash the earth in order to separate the gold, and then dump the water and debris into the most convenient canyon or ravine. This has been the universal practice in those counties, except where the miners have impounded their own debris in order to wash it a second time. After impounded tailings were washed, they were then allowed to escape through the most convenient and available natural channels. I have been through the mining counties from Amador to Siskiyou. This custom of discharging from the mines the debris into the most convenient canyons or ravines, has been the universal custom among all the miners of California, as far as my observation goes, from 1849 up to the present time. This mode of mining is the only way in which the mines could be worked profitably. Gold mining cannot be prosecuted except with the use of water. I am familiar with all the streams in Nevada and some adjoining counties, and all, or nearly all, of the canals in those counties. [Witness described the Eureka Lake, South Yuba, Rock Creek, Bloomfield, Milton and other canals, giving their locations, source of supply, and the mines they furnish with water. He also described the large reservoirs that held back large amounts of the winter's water for use in summer mining.] The canal companies I have mentioned all have large reservoirs at their sources, and some of them have a great many. Some of these are natural lakes dammed at their outlet, three or four miles in length, and varying in depth from nothing to 100 ft. The North Bloomfield reservoir, with which I am very familiar, having boated upon and fished in it for eat many times, is about four miles in length, and has an average depth of from 50 to 60 ft. The water from these reservoirs is not discharged until the waters in the creeks, ravines and natural channels fail. The amount of water discharged from the Excelsior, South Yuba, North Bloomfield and Milton mines is at least double the quantity of water flowing in the Yuba during the dry season. During the dry season, those mines discharge of this stored water, at least 20,000 miners' inches. This amount of water would make a stream 100 ft. wide and 3 ft. deep. This volume of water confined in a canal, would float most any of our up-river steamers. During the winter of 1850 and 1851, within an area of three miles of Nevada City, there was an estimated population of 20,000. At least 15,000 of this population were engaged in mining. There are not 100 men engaged in hydraulic mining within this same area at the present time. There were several thousand men mining in Sierra county in 1850. Nearly all the early mining was in light soil and shallow surface diggings.

The reservoirs supplying the canals for these mines are mostly situated near the summit. The Bowman reservoir occupies the whole of a valley. It was dammed up in a narrow gorge, and the whole valley, several miles in length and a mile wide, was thus flooded. I consider that the storing of water in the winter, and sending it down during the dry season, greatly assists in the navigation of the rivers of California.

Witness was examined minutely regarding the flow of water from the reservoirs referred to in his direct examination; the quantity of water used by miners daily along the Yuba must have been more than 17,000 inches. [The report of the County Assessor showed the quantity to be about 17,000 inches, supposing the miners to have worked 300 days per year.] The mining population in Nevada county has been largely reduced within late years.

Resuming, witness stated that when he testified that the practice among miners was to dump their tailings in the most convenient places, he simply stated a fact; there was no compulsion in the matter—they were not obliged to do so; sometimes the nearest canyon was not the most convenient one; monitors did not come into use in hydraulic mining until 1865; before that the ordinary goose-neck was used; powder was first used largely in 1853 or 1854, but in the gravel banks it was not generally used until 1865; the Excelsior, the Milton, the Eureka Lake and North Bloomfield companies do, perhaps, on an average, sometimes three-fourths and sometimes one-third of the mining now done along the Yuba; they use perhaps more than one-half of the water brought in by artificial means, but there is a great deal of mining done by aid of the natural water-channels; during the flood season, the water in most of the ravines is used for mining.

Lectures to Young Mechanics and Apprentices.

Schools of Machinery.

The last lecture given before the young mechanics and apprentices of this city, at Capt. McNavins' hall, by John Richards, Superintendent of the San Francisco Tool Co., was on the subject "Standards of Measurement as Applied to Industrial Processes." In introducing his subject, Mr. Richards said:

Before commencing the regular paper of the evening, I desire to make some preliminary remarks, and to offer an explanation.

In the first place, I desire to call your attention to the fact that we have in the United States what may be called two schools of machinery. One of these may be called the New England, and the other the Philadelphia school.

Down to a short time ago, and, indeed, now, to a great extent, the distinction between these schools was, that in Philadelphia and Western places where Philadelphia methods were adopted, the purpose was to see how well things could be made. While in New England, the first purpose was to see how cheap they could be made.

This remark I have quoted from one of the most distinguished mechanicians in New England, Mr. Brown, of Brown & Sharp, Providence.

There is also another distinction, that of ornamentation and chromatic painting.

In New England, and there alone in the whole world, was ornament made a part of machine construction.

By ornament I do not mean graceful framing with pleasing outlines, but fillegree work, beads, curves, cornices, panels, variegated colors, and of all things, varnish, that will make even the best castings look hideous.

The rivalry between these schools has grown less during ten years past. Public opinion would not support the New England methods, and most makers of machine tools and like machinery there have been compelled to adopt the Philadelphia method of casting the frames of machines in one piece, placing the metal in the line of strains, scraping surfaces to fit, and painting machines to represent what they are, iron.

The Type of Machine Tools

Made in Philadelphia, and let me remark, that type is not different from any other country, tools being made the same in nearly all parts of the world, began with Messrs. William Sellers & Co., of that city. This firm, in founding their business, very wisely examined the machine tool practice of Europe, and imitated many of Whitworth's designs, or as I should say, his fitting. Some of these original designs, notably, shaping and slotting machines, have not been much changed down to this time.

Messrs. Sellers & Co. made many important inventions, some of which have been employed all over the world and are copied by the best makers in this country.

These remarks are preliminary to calling your attention to a paper read before the late meeting of the Mechanical Engineers' Society, at Hartford in Connecticut. This paper is a commercial bid for business on behalf of an Eastern firm, and its principal feature is the manner in which it ignores all that has been done by myself and others in the construction of accurate gauging machines and implements in this country.

Prof. Rodgers, of Cambridge University, was sent to England to hunt up standards, and after procuring various kinds, Messrs. Pratt & Whitney constructed two machines for *visual* divisions of these standards—the old idea of microscopes, hair lines, etc., that will no doubt fail, as all future experiments of the kind must. No scientific man has ever divided a lineal standard in this way. It is the expedient of a scientific man, not a mechanic. Fifteen thousand dollers, we are told, has been expended in this hunting for a standard, and no implements have been made. Everything done has been paraded before the engineers of this country, in a manner that too plainly indicates what I will call "huncombe." The divisions made at Philadelphia were mechanical; so were those of the Whitworth company, and I incline to the opinion, that in a common machine shop in Cincinnati 20 years ago, was made a set of divisions for a foot that were more true than we will ever have from the Cambridge visual machines, or any other constructed on that plan. The divisions referred to were made at the Niles Tool Works.

The animus shown at this meeting revives the old

Controversy Between the two Machinery Schools

I have named. It is the old paint and fillagree school again; ignoring all that has been done, and quietly assuming they are about to begin a *new* business in making gauges. The difference between saying and doing is very great. They will find two things out before they have done. One, that no visual division of the yard or meter will be perfect, and that in making gauges, a standard is by no means the greater part. This brings me to the explanation.

It was my intention to have prepared for this society a paper on the various processes of making exact implements, including various phenomena that arise in such processes, both as to the nature of material and the cutting or abrading operations employed to attain precision. This I cannot do at this time; it would be of too much use to those people who have commenced to work at Hartford.

Instead, I will speak of standards; leaving to some other time the processes of preparing implements.

In a late number of the "American Machinist" some one has told us all about

"Gauge Making,"

And claims to be himself a practical maker of such implements. As many of you as have read this learned essay have, no doubt, been astonished at some of its propositions, especially if there are any here who know the processes for making cylindrical gauges in Europe.

He informs us how the Whitworth Co. test their gauges, a matter, I am afraid, he knows nothing about, especially as I am able to controvert his statement fully. We are also informed of the wonderful swelling and shrinking of steel gauge pins in two directions—first one way, then another. This alone will, I think, furnish a true measure for most of the dogmatic statements the article contains.

Away out here, where we do not know much of mechanics, and only make quartz mills and the like, there are no doubt several, if not many, who know something of the change that may, not does, take place in such pins when made from rolled bars.

Such change is due to what may be called lamination; it is exceptional and infinitessimal, not constant and marked, as the writer in the *Machinist* would have us think.

In respect to the remarks made in the same article about "snap gauges," if the writer means calipers, I do not know what a snap gauge is. He is very far wrong in mentioning these as less difficult to make than pins or collars. I will, however, have something to say of this in a future place, and will now proceed with the regular paper of the evening.

This paper, I may explain, is a revision of one read before the Academy of Sciences some months since.

[Having published the original extended paper in the MINING AND SCIENTIFIC PRESS of Oct. 15th, 22d and 29th, 1881, with illustrations, it is not necessary to give the abstract.—EDS. PRESS.]

Detection of Copper.

The green color which most copper compounds give to the blow-pipe flame, and the reactions of its oxides with the fluxes, render its presence easily detected. The production of a red heat with salt of phosphorus in the reducing flame of the blow-pipe, is rendered more certain by the treatment of the heat or charcoal with a small amount of tin.

Copper may also be detected by saturating a salt of phosphorus heat with the substance containing it, and adding chloride of sodium, when the heat will color the flame beautifully blue, owing to the formation of chloride of copper.

Many minerals give this reaction by simply moistening in hydrochloric acid, and exposing in the platinum forceps to the flame. Silicates should be first pulverized, moistened with hydrochloric acid, and evaporated to dryness in a porcelain; then made into paste with water.

Brush, in his "Determinative Mineralogy," adds to the above that, in case the copper is combined with nickel, cobalt, iron and arsenic, the greater part of the cobalt and iron may be separated by treating with borax or charcoal. The remaining metallic globule is fused with a small quantity of pure lead, and then boric acid is added; this last dissolves the lead and the rest of the cobalt and iron, while most of the arsenic is volatilized. The cupriferous nickel globule, which still may contain a little arsenic, is treated with salt of phosphorus in the oxidizing flame; the heat obtained will be dark green while hot, and clear green when cold. The last green is caused by a mixture of the yellow of oxide of nickel and the blue of oxide of copper.

According to Guericke, a very delicate test for copper is to mix the substance under examination intimately with chloride of silver, and fuse on iron wire. In this manner the smallest quantity of copper may be detected by the blue color imparted to the flame.

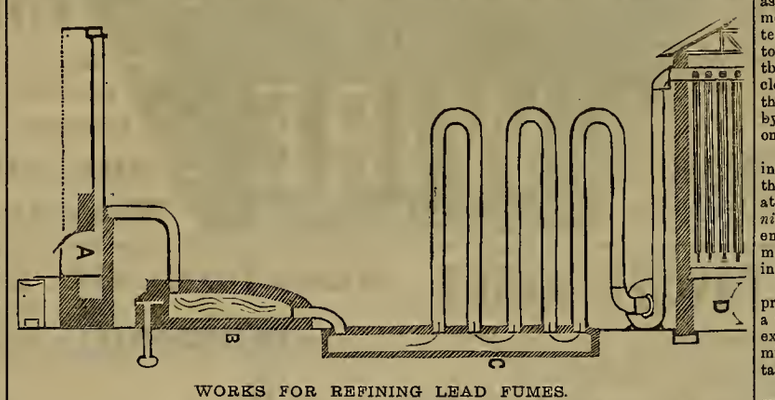
THE Alexander mine, at Grantsville, Nye county, Nev., has been sold to Ferdinand Van Zant, for an Eastern company, for the sum of $676,000. The money was paid down in one check.

Process of Refining Lead Fumes.

Generally white lead pigments have been manufactured from galena, or other lead ores in raw or roasted state, by subjecting them to the joint action of heat and air, according to the quality of the lead ores used; or it has been manufactured from waste lead fumes from lead smelting and refining by passing them through externally-heated tubes, retorts, or muffles before catching the fumes, or by returning the crude fumes after first collecting them in bags or screens of textile fabric and then again collecting the refined lead fumes.

By these processes the refined fumes are dissolved by particles of carbon or sulphurets of lead, or both, if the greatest care is not taken in keeping a bright fire in the furnace, and in the selection of the fuel. In the case of waste fumes these are nearly always gray, and sometimes almost black.

Two inventors, C. T. Lewis, of Philadelphia, and E. A. Bartlett, of Pemberton, N. J., have found that by passing the fumes, after leaving the furnace where they are formed, over or onto a bright or clear fire, or by passing them through a furnace in which generated gas is burned, the dark and black particles are all burned out, and the fumes are refined; and after passing through the cooling pipes, they can be caught in the bags of textile fabric, and will be in the form of a white powder. The accompanying drawing shows works constructed on this principle. *A* is a Scotch hearth, where the fumes are produced. From there they pass into the furnace, *B*, which is heated by a flame of generated gas, which burns out all the impurities contained in the incoming fumes, which it purifies, and the purified white lead fumes then pass through the cooling pipes, *C*, and are blown into the catching or screening apparatus, *D*.



WORKS FOR REFINING LEAD FUMES.

The inventors prefer to use a generated gas flame, on account of uniformity of composition and easy management. This process will probably work well in all cases, except where they have to deal with waste fumes from smelting raw and unroasted sulphuret of lead. In this case they will find a great deal of sulphuric acid is produced, and the process will not work well, except when the fumes are passed into the coal fire.

INDIAN PEAK MINES.—Charles Brunson writes us from Indian peak, Fresno county, as follows: The work in the mines, around and in the vicinity of the Indian peak, is progressing in real earnest. The Surprise mine has a shaft down 115 ft., and prospects well. Parties owning the Eagle mine have started work again. The rich cross lead, Gambetta, which runs across the Eagle location, is turning out very rich ore. Some of the ore has worked up in the thousands to the ton. The shaft is down 140 ft. Mr. L. Voyle and Mr. Chas. Burt, of Knight's Ferry, have bought the controlling interest in the Hancock mine, and are preparing to go to work. The vein prospects well, and lies in a talc formation and prospects from wall to wall. The Red Rover is also a very promising mine, and has a shaft of 60 ft. There are also other locations that look well and give promise of being rich in gold. Fresno river is only 1½ miles from these mines, where there is plenty of water for milling purposes. There is plenty of timber and one of the best climates in the State. The great Madeira lumber flume, that is 60 miles long, passes 1½ miles from the mines, so that all sorts of lumber can be delivered.

THE 40 stamp mill at the Providence mine, Nevada City, is in operation night and day, crushing 100 tons of ore every 24 hours. The new arrangement by which water is brought from the Snow Mountain ditch through 1,600 ft. of 22-inch pipe, works to a charm. It is believed that 90 inches of water, or 10 inches less than is now being used, will furnish sufficient motive power, the fall being nearly 400 ft.

A GENTLEMAN in from Ward informs the White Pine *News*, on what he considers good authority, that between 1,500 and 2,000 tons of good ore has already been stoped out in the Paymaster mine at that place. The mill will be started up in the spring.

An Address from the Miners' Association.

The Miners' Association of this State has addressed to the mine owners of California and members of the association the following appeal:

Gentlemen:—We desire to call your attention to the pecuniary necessities of this association arising from the protracted and vexatious litigation now pending and in progress in the courts, which involves the very existence of the mining industry in California.

In addition to the cause now on trial in Sacramento (State of California vs. Gold Run Mining Company), we are defending in the Superior Court of Yuba county 32 suits, wherein the city of Marysville is the plaintiff; and also, in the Circuit Court of the United States, the case of State of California vs. Miocene Mining Company, of Butte county. Any of these said actions, if finally decided in favor of the plaintiffs, will seriously injure the value of all classes of mining property in our State.

The case now on trial at Sacramento has assumed a broad scope, and may be considered a test case of most of the important issues in the conflict of the miners with the anti miners. Realizing the magnitude of the interests involved, the association, as is well known, has engaged the services of the most eminent counsel, and the best engineering skill in the State, and it has spared no expense in presenting the miners' side of the case in such a manner, that, if appealed to the highest Court in the country—as it will be by one or the other parties in interest—we shall have a complete record.

It is in contemplation, as soon as the trial of the "Gold Run case" has been closed, to call a convention of miners, under the auspices of this association, of which due and timely notice will be given in the newspapers and otherwise, as to the time and place, to consider ways and means for the common defense of the mining interests and rights. All miners will be invited to attend, irrespective of their connection with this association, and without reference to the class of mining in which they are engaged, as the mining interest at large is placed in jeopardy by these continued and persistent attacks upon it.

In the defense of the common property and interest, as well as the rights of the miners, the burden has fallen heavily upon this association, and unless it has the moral and *pecuniary* aid of the mine owners at large, so as to enable it to meet all these issues, the result may be equivalent to a confiscation of all mining property.

The association suggests to its members the propriety of co-operation in this measure, with a view to the formation of a more perfect and extended organization, so as to defend the mining interests whenever and wherever attacked in our State.

In conclusion, this association urges all active members to use their influence to induce mine owners, who are not members, to become such; for it is quite certain, in this grave struggle to protect the rights of the miners, that this association will require the united support, both moral and financial, of the entire mining interest of our State.

HAMILTON SMITH, JR., President.
L. L. ROBINSON, Vice President.

Board of Council:—Egbert Judson, L. L. Robinson, Thos. Price, Hamilton Smith, Jr., Wm. Ashburner, R. E. Brewster, M. A. Sheppard, Thos. Bell, Alvinza Hayward, J. B. Haggin, J. P. Pierce, A. A. Sargent; W. A. Skidmore, Secretary.

Debris Dams.

United States engineers, under Colonel Mendell, acting in the interest of the Federal Government, have been making very careful surveys of the Yuba, American, Feather, Calaveras, Mokelumne and Cosumnee rivers, seeking for the best localities where dams may be constructed, and reservoirs for mud wherein slickens may be retained. The topography of the country has been carefully examined and mapped, and possible storage places noted. One party of engineers under Marsden Manson, surveyed the upper rivers—that is, the Calaveras and Mokelumne and Cosumnes. Another party, under Lieutenant Payson examined the Yube, American and Feather. The result of their explorations is that they have selected locations for the construction of reservoirs that will hold the sediment for five years to come. In all, six lakes will probably be constructed. One, the largest, will be on the Yuba, just below the Smartsville dumps. Another will go upon the American, just where, is not yet decided—probably near its exit from the hills. There are about a dozen other localities where reservoirs may be put in, and it will depend upon the amount of the appropriation which will be selected. Mr. L. J. Le Conte, Assistant United States Engineer, is of the opinion that by the time the five years have elapsed, when new reservoirs must be constructed, the Sacramento will be cleared of its deposits. The slope of the stream bed has been gradually increased by filling up of the hollow at the middle of the stream, allowing the round howlders to be rolled down by the freshets. The sediment in the reservoirs will sink, allowing comparatively clear water to overflow, and this water, particularly in freshet times, will scour out the river bede, restoring navigation.

Col. Mendell is of the opinion that the miners will materially aid the government it its work.

PACIFIC MACHINERY DEPOT.

The Korting's Injector is the simplest, cheapest and best in use. Will draft its own water, hot or cold, and feed under varying pressure. Send for Circular.

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

—o—

No. 1 XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

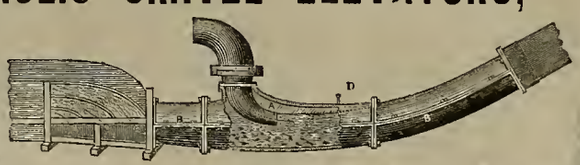
HYDRAULIC GRAVEL ELEVATORS,



For working flat gravel mines that have no dump.

Sluices gravel and water up hill on an angle of 45°, and will run any kind of gravel that will run in a flume. Handles rocks as easy as fine dirt, and will raise as much material as the water will carry off in a flume on 6 inches grade to 12 feet.

No bedrock cuts, tunnels or drains required. Machine a sufficient drain itself, and the process of mining the same as any other hydraulic mine. Is now a practical success in various places in California and Oregon. Send for descriptive circular to

JOSHUA HENDY.

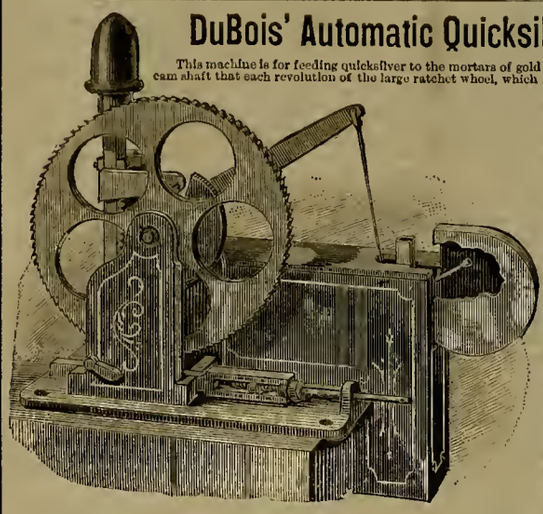
Office and Manufactory, 130 Beale Street, San Francisco.

SHEET IRON PIPE.

DuBois' Automatic Quicksilver Feeder.



This machine is for feeding quicksilver to the mortars of gold mills. It is so connected to the cam shaft that each revolution of the large ratchet wheel, which can be regulated to revolve once in one, two, three or four minutes, as desired, dips a small cup into a reservoir of quicksilver, and by a trip of the cam, empties the contents into a pipe leading down to the mortar, supplying an exact quantity at regular intervals, superseding the ordinary hand feeding, which is of necessity subject to great irregularity, and liable to neglect. It renders the amalgamation of all the gold in the pulp equally certain and perfect.
The mechanism to produce this depression and elevation of the cup, is driven by the cam shaft, similarly to the self-feeders, over which so much ingenuity has been expended to regulate the delivery of ore to the mortar. As it is to be desired to have the ore go in constantly and regularly, so it is equally desirable to have the mercury fed constantly and regularly.
A chief point of excellence of this machine is, that it allows the quantity of mercury which would be otherwise fed in mass, in one hour, to be subdivided into a number of small portions, and fed almost continuously; *i. e.*, from every one to four minutes.
Price, complete, $100.

For Sale by **WHITNEY & MARSHALL,** Sole Agents
22 & 24 Fremont St., San Francisco.
Dealers in Iron, Steel, Hardware and Mining Supplies, Wrought Iron Pipe and Fittings, Pump Columns, Wire Rope, etc. A large stock of Boiler, Plate and Sheet Iron of every description.

MOREY & SPERRY,
MANUFACTURERS OF
Gold and Silver Grinding and Amalgamating Machinery

HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.
It weighs complete, 7,000 pounds. It costs $1,500 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.
Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver ores, Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies. Iron Work complete for Wood Frames, also

SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.

☞Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores, Wet or Dry Crushing Mortars.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, No. 252 Market St., S. F.

FOR THE WEEK ENDING DECEMBER 27, 1881.

251,402.—PAPER BAG MACHINE—A. Beyer, Oakland.
251,408.—FRUIT DRIER—R. E. Burns, S. F.
251,577.—RECEPTACLE FOR PACKING SOAP—N. W. Griswold, S. F.
251,361.—MAIL POUCH FASTENER—R. H. Hewitt, Los Angeles, Cal.
251,442.—GRINDING AND AMALGAMATING PAN—F. A. Huntington, S. F.
251,595.—HARVESTER FINGER—C. J. Johnson, Lone Pine, Cal.
251,443.—SPRAY NOZZLE—Long, Vestal & Merigot, San Jose, Cal.
251,373.—COMPRESSING PUMP—S. D. Lount, Arizona Ter.
251,449.—BOX FASTENER—Chas. Martell, Vacaville, Cal.
251,615.—SHACKLE FOR HORSES—J. C. McCollum, Los Angeles, Cal.
251,617.—EGG AND FRUIT CARRIER—John J. McIntire, Oakland, Cal.
251,464.—SHACKLE—Jas. T. Rogers, Westport, Cal.
251,480.—CARPET BEATER—John Spaulding, S. F.
9,990.—POWER STEERING APPARATUS FOR VESSELS—A. J. Stevens, Sacramento, Cal. (re-issue.)
251,435.—FURNACE—Henry R. Taylor, S. F.
251,488.—PORTABLE HAMMOCK—N. Vizelich, Stockton.
251,417.—RAILWAY SWITCH—M. R. Dahlgreu, Oakland.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

SHACKLE.—James T. Rogers, Westport, Mendocino county, Cal. No. 251,464. Dated Dec. 27, 1881. This invention relates to a new and useful device for uniting cables; and it consists of an open link, the shanks of which are perforated, and have extended slots connecting therewith, through which a bolt passes, said bolt bearing a tug or projection at the end opposite the head and a rib to fit between the shanks at the link. The bolt passes through the adjacent closed link, so that the bolt after being introduced through it, will be turned by it so that its tug and rib will turn away from the slots in the shanks of the open link, whereby it will be locked in place and retained. The object is to provide a convenient and easy connection for chains or cables which are fastened to buoys. In the ordinary method the bolt is fastened with a key, which is separate therefrom and is liable to be lost or misplaced at a critical moment. In this invention this is obviated by having the bolt fastened by the extended rib, which, being connected therewith, cannot be lost and is operated by the cable itself.

HYDROCARBON BURNERS.—Evan A. Edwards, San Buenaventura, Ventura Co., Cal. Dated, Jan. 3d, 1882. No. 251,849. This hydrocarbon burner is in the class adapted to burn liquid fuels and to be attached to steam boilers. It consists in a peculiar and novel construction of parts, whereby the steam, oil and air open out separately from the end of the burner. The steam is conducted in a separate passage around the oil passage, and allowed to mix with and atomize the oil only after said oil has passed its valve and is beyond the end of the burner—a point of advantage being herein considered. The air is drawn in through a passage made through the valve stem, so that the oil, steam and air come together beyond the mouth of the burner, and within the combustion chamber of the furnace.

SELF-CLOSING STOPPER FOR BOTTLES.—David Berry, Bolinas, Marin Co., Cal. Dated Jan. 3, 1881. No. 251,819. This invention relates to a novel means for closing the mouths of bottles without the use of corks or other stoppers; and it consists in the employment of a supplemental cap, which may be fitted to the mouth or neck of any bottle by suitable means, and is provided with transversely moving slides, which close across the mouth and are operated by closing springs and levers, by which they may be opened. The device may easily be placed upon any bottle or transferred from one bottle to another.

GRAIN CLEANER.—Wm. Williamson, Rio Vista, Solano Co., Cal. Dated Jan. 3, 1882. No. 251,994. This invention relates to that class of agricultural implements known as grain cleaners, in which the grain is received upon shaking screens and subjected to the action of a blast of air from a revolving fan. It consists in such a construction of the screen-containing shoe and the means for operating it as will impart to the screen a peculiar movement, very effective for the purpose.

THE funeral of the late George Daly, the well-known mining man, who was killed by the Apaches in New Mexico on the 18th of last August, took place on Thursday, from Grace Church, in this city.

Aliens and Relocations of Mining Claims.

The following decision of the Supreme Court of Nevada is of interest to locators of mines and to alien citizens:

The decision is in the case of S. Sever and John Chiatovich, respondents, vs. E. Gregovich, appellant:

This is an action to recover the possession of an undivided one-half interest in a mining claim.

Plaintiffs obtained judgment and defendant appeals.

The facts are, that on the 1st of August, 1867, S. Sever and E. Gregovich located the mining ground in controversy, viz.: 600 ft. in length of the Georgs Washington lode, 200 ft. thereof being for a discovery claim; that on the 15th of February, 1873, Sever conveyed his interest therein, by deed, to B. Evanovich; that on the 10th of May, 1874, Evanovich conveyed the same interest to the plaintiffs; that on the 24th day of September, 1872, Evanovich declared his intention to become a citizen of the United States, and received his naturalization papers on the 8th of September, 1873; that on the 6th of June, 1876, Sever declared his intention of becoming a citizen, and afterwards, and before the relocation of the premises by the defendant Gregovich, he was duly naturalized, and became a citizen of the United States; that on the 18th of February, 1880, the defendant, Gregovich relocated the mining ground in controversy in his own name, without the consent of plaintiffs, or either of them; that during all the time from the first location of the claim by Sever and Gregovich until the relocation of the premises as above stated, the work and labor as required by the Statutes of the United States and the laws of Columbus mining district, where said claim is located, were performed by said parties, and that during all of said time said Evanovich, or said plaintiffs, with the consent and assistance of said defendant, and jointly with him, had the said work and labor performed, and that during said time the said Sever and Chiatovich have paid to the said Gregovich various sums of money for his doing their proportionate part of said work and labor.

Upon the trial, the defendant offered to prove that the Victor mining claim was discovered and located for several years prior to the 1st of August, 1867, and was upon the same lode as the Georgs Washington claim. The object and purpose of this evidence was to show that the locators of the George Washington claim were not the discoverers of the lode.

Appellant, Gregovich, claims that the Court erred in refusing to admit this testimony, and that Sever, being an alien at the time of the first location of the claim, had no right to hold or claim an interest therein, and for these reasons the relocation of the claim by himself was valid, and the respondents have no valid interest or claim to any portion of said mining ground. We are, however, of the opinion that the judgment of the District Court is correct.

Appellant in not in a position to take advantage of the defects, if any exist, in plaintiff's title to the ground in dispute. He joined with Sever in claiming 200 ft. of the ground as a discovery claim, and afterwards recognized the claims of Sever, Evanovich and Chiatovich to the mining ground, including the discovery claim of 200 ft., as being valid. He accepted from them their proportionate share of the money expended for work and labor done upon the entire claim, and for these reasons he was and is estopped, by his conduct and acts, from denying the rights claimed by Sever and Chiatovich as owners therein. (1 Green on Ev., Sections 207, 208; Herman on Estoppel, Section 336; Lessee of Merritt vs. Horne, 5 Ohio St., 318.)

The judgment of the District Court is affirmed.

THE RAILROAD COMMISSION.—At the meeting of the California Railroad Commission this week, Gen. Stoneman called up his resolutions, introduced last November (which we published at the time), requiring the companies to furnish second-class accommodations to holders of second-class tickets, at rates not exceeding 60% of the first-class fare. The resolutions also contained clauses to the effect that second-class passengers should not be obliged to ride in the smoking cars, and that they be entitled to the same privilege of "lay-over" tickets as the first-class passengers. A warm debate ensued, and the resolutions were finally laid aside for want of a second. To say the least, this is unfortunate. Second-class passengers have rights which ought to be protected, and they are generally less able to "stand up" for them than first-class ones.

REPORTS from Magdalena are to the effect that the State Congress of Sonora has abolished all tax on mines, mining machinery and capital invested, and proposes to make a light tax only on the net proceeds of the mines.

Two mills in Six-mile canyon are running on ore from Lady Bryan croppings. Thos. Holley is running two mills on Monte Cristo ore. There is now sufficient water for all of the canyon mills.

THE total assessment of San Bernardino county for 1881, outside of the town, is $63,126.96, and $43,312 was collected.

News in Brief.

RICHARD H. DANA, JR., died in Rome, Italy, Saturday.

THE best feminine help in Sweden receives $4 a month.

SMALL-POX caused 450 deaths in New York city in 1881, against 31 in 1880.

THE East river bridge needs $600,000 more to complete the structure, which has already cost $13,377,000.

ASHCROFT, Colorado, is to have two smelters. The town trustees have donated a tract of land for that purpose.

A GENERAL arrest of saloon-keepers was made at Willows on Monday for disregarding the Sunday law on the previous day.

ADDITIONAL copper discoveries are reported from the Santa Catalinas, Arizona. The bodies of ore are reported to be very large.

THE annual copper product of the United States is now given in a supplement to the census at 50,655,140 lbs, worth $8,842,961.

THE gallows to hang Garcia on next Wednesday is already erected at San Buenaventura, but an appeal will be taken to stay the execution.

THE profits of the Richmond M. Co. (Eureka) during the past six months, after paying all expenses, have been over a quarter of a million of dollars.

THE contract awarded to Lynde & Co., on the mountain division of the Northern Pacific, W. T., calls for 500,000 ties and 10,000,000 ft. of lumber.

IT is said that 7,000 negroes in South Carolina have agreed to join the present "exodus" to Arkansas, and whole neighborhoods are being depopulated.

THE Postoffice Department issued stamps to the value of $640,000 last Saturday, the largest ever known, being 20,000,000 stamps and 6,000,000 postal cards.

THE total cost of the St. Gothard tunnel, which was opened last Sunday for the regular passage of trains, is 56,808,620 francs, something over $11,000,000.

THE fact that the present year of grace, 1882, is to have one Sunday more than most years, is regarded by many good people as a cheerful omen for the advance of the gospel.

IT is reported that the new steamer Walla Walla will be sent from Portland to Hongkong with flour, and return with 1,000 Chinese to work on the North Pacific railroad.

NEWS from El Paso, Tex., is to the effect that small-pox has broken out there to an alarming extent. There are nine cases in New York, and it is spreading in Jersey City. It is increasing rapidly at Pittsburg.

SPECIAL dispatches from points in Ireland show a great development of the latest form of lawlessness, namely, Land League hunts. A number organized Friday. In rare cases, where the authorities had not had time to interfere, quantities of game were destroyed and preserves damaged.

ORDERS have been received at New Orleans from San Francisco to provide freight room in March and April for 180,000 bushels of wheat for Great Britain. This wheat is to be shipped from California to New Orleans by the Southern Pacific railroad, thence by steamer to its destination.

Business Offices and Sunny Rooms to Let.

We have some desirable rooms to let adjoining the offices of this paper which will be rented on favorable terms. Stair entrance, No. 252 Market St. Elevator, No. 12 Front St. Parties wishing offices, etc., will do well to call and see them. DEWEY & CO.

Mining and Scientific Press.

THE MINING AND SCIENTIFIC PRESS is the leading mining journal in America, and enjoys a larger circulation among the more intelligent operators and workers in the gold fields of the world.

Established in 1860, it has firmly maintained its position as a reliable, progressive journal. The information given in its columns has saved millions of dollars to the practical miners, metallurgists, mill men, mine and shareholders on the Western side of our continent.

Among its contributors are the ablest and most experienced mining engineers, superintendents and practical miners in this country.

The PRESS gives a condensed summary of Mining News from the most important mining districts of the country.

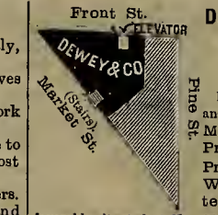
New processes and methods of mining are described in its weekly issues. New mining machinery and improvements are frequently illustrated and explained in a manner to be of great value to all interested in mining.

As a scientific and mechanical representative of the Pacific coast it is decidedly popular, and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivalled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer, will find profit by its reading.

Subscription, $4 a year in advance. Sample copies, postpaid, 10 cents.

DEWEY & CO., Publishers.
No. 252 Market St., San Francisco, Cal.



Dewey & Co.'s Patent Agency and Newspaper Offices.

Dewey & Co.'s Patent Agency and the business offices of the Mining and Scientific Press, Pacific Rural Press, Pacific States Watchman and the Fraternal Record are now favorably situated at No. 252 Market Street. Elevator entrance, *No. 12 Front St., S. F.*

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

G. W. MCGREW—Santa Clara county.
M. P OWEN—Santa Cruz county.
J. W. A. WRIGHT—Merced, Tulare and Kern counties.
JARAN C. HOAG—California.
B. W. CROWELL—Humboldt and Trinity counties.
D. W. KELLENER—Merced, Fresno and San Benito.
A. C. KNOX—State of Nevada.
EDWARD A. WEEN—San Francisco.

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct, or if the paper should ever come beyond the time desired, be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omission of agents.

Sewing Machines.

Several first-class styles, good as new, will be sold at a bargain. Call on or address H. F. D., at this office.

BOOKSELLERS, STATIONERS, ETC.—Messrs. Payot, Upham & Co., No. 204 Sansome Street, are one of the oldest, most enterprising and reliable firms in the book and stationery trade in San Francisco. Scientific, industrial and foreign publications are a specialty with them. They are also noted for their first quality of blank book and fine stationery line of goods.

PERSONS receiving a sample copy of the MINING AND SCIENTIFIC PRESS *with this notice marked*, are requested to examine the merits of the same, and consider fairly its claims for support, and if consistent, subscribe for the paper through the P. M. or agent delivering it, or otherwise. We shall send it, on trial, at the rate of $4 per annum for any period the reader may wish. Please notice our terms elsewhere, and if desired, send for further samples and information. Those who can circulate this No. further to our advantage are invited to do so.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $3 per (half-yearly) volume. In cloth and leather binding, $5. These volumes, complete, are scarce and valuable for future reference and library use.

THE State Mining Bureau, No. 212 Sutter street, is open to the public from 10 o'clock A. M., to 5 o'clock P. M. daily, (Sundays excepted). Henry G. Hanks, State Mineralogist.

BY TELEPHONE.—Subscribers, advertisers and other patrons of this office can address orders, or make appointments with the proprietors or agents by telephone, as we are connected with the central system in San Francisco.

CORRESPONDENCE on mining and other subjects represented by this journal is solicited from all reliable sources. Send us information, early and often, if ever so brief.

COPP'S "U. S. MINERAL LANDS, LAWS, FORMS, INSTRUCTIONS AND DECISIONS."—1881. 570 pp. In full law binding, $4.50; half law binding, $3, at this office.

ANNUAL STATISTICIAN of 1881.—"It is the most complete and accurate work of its kind in the world."—*S. F. Call.* Address L. P. McCarty, 816 California st. Price, $4

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36 3; BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful All Rivets Hand Driven.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. R. Haggin for Giant and Old Abe Co., Black Hills; also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. McCaskell's Patent Car Wheels and Axles—Best in Use.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

VULCAN BLASTING POWDER.

—THE MOST ECONOMICAL AND BEST—

Nitro-Glycerine Explosive in the Market.

In the suit of the Giant Powder Co. against the Vulcan Powder Co. for *alleged* infringement of Patent, it was held that the Giant Powder Patent was INVALID.

Nos. 1, 2 and 3 Vulcan,

Each grade superior to like numbers of any other Nitro-Glycerine Powder in the market.

VULCAN B. B.,

Superior to Black, Judson or any low grade Powder for Bank Blasts, Railroad work, or any work where Black Powder has been heretofore employed.

TRIPLE FORCE CAPS AND ALL GRADES OF FUSE.

The CONSUMER'S COMPANY sell the best Powder at the lowest rates.

Office—218 California St., San Francisco.

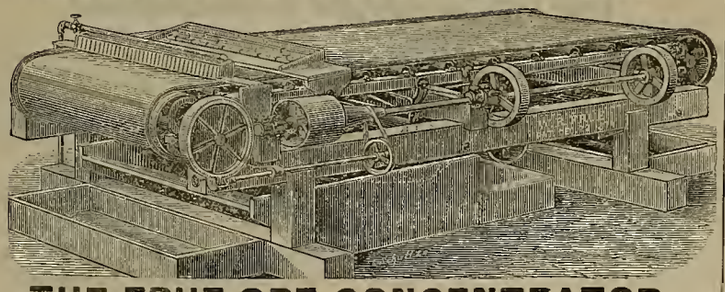
$1,000 CHALLENCE!



THE FRUE ORE CONCENTRATOR.

Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.

Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.

We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.

☞A machine with all improvements can be seen in working order and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont street.

ADAMS & CARTER, Agents, Room 7 No. 109 California Street, S. F.

DEWEY & CO.'S

Scientific Press Patent Agency.

[ESTABLISHED 1860.]

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other Agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

VOLUME XLIV. Number 3.

Process of Treating Copper Ores.

A process specially applicabls for copper pyrites bas rscently been inventsd by C. Tessie dn Motay. Thess orss have hitherto been very difficult to rednce, the expense of ths process being gensrally more than ths valne of the re-snlt. This nsw process, bowsver, is simpls, rs-quiiing comparatively littls fuel, and reducing the pyrites, in one opsration, to the state of metallic copper. Tbs manner of treating tbe pyrites is by forcing tbrough them, while in a melted condition, air, steam and a combustible gas.

Fig. 1 of ths accompanying engraving, reprs-sents a vertical section through the reducing furnace used in this process. Fig. 2 represents a vertical section of a modified form of the apparatus.

The apparatus consiete generally in a chamber or furnace eo constructed as to contain the melted ores to he treated, and to facilitate the forcing tbrough the oree in a molten condition of the various gases before referred to. In the form sbown in Fig. 1, it consists generally of a U-sbaped chamber or furnace, one end being closed and the other being open for the escape of the gases, aud connected with the chimney, *G*, as ehown. The chimney is divided by a partiton, *R*, as shown, provided with an opening, *O*, at its bottom. In other words, the partition does not entirely divide tbe ohamber. Arranged to communicate with tbe closed portion of the cbamber are tbree reservoirs containing the gas, eteam and air respectively. Tbese reservoirs nre not sbown in Fig. 1, but are represented in the modified form in Fig. 2.

Tbese cbambers commnnicate with the furnaces by pipes, *a*, *b*, c, each provided with valves, *V*. The first one of these chambers or vessels, *A*, contains a combustible gas, preferably that known as "water gas," at a suitable pressure, say of three or four atmospborss. The vessel, *B*, contains steam, preferably superheated, and at abont the same pressure.

The steam used in the vessel, *B*, may he prodnced by tbe same apparatus which makes the water gas contained in the vessel, *A*; or the veesel, *B*, may represent a boiler preferably provided with a suitable snperbeating apparatus. Tbe furnace, *F*, is also supplied with a snitable supply aperture, *P*, and a delivery aperture, *D*. These are arranged to be properly closed by plnge or valves.

Tbe coppsr pyrites having bsen first melted in an apparatus suitably arranged, are cansed to flow into tbe furnace, *F*, through tbe supply opening, *P*. The vessel containing compressed air, wbich air may also he heated, ie put in communication by meane of the tube, *C*, with tbe closed portion of tbe furnace cbamber. The pressnre exieting in tbis portion forces the air downward and through the melted pyrites beneath. The resnlt of tbis operation is that the snlpbnr oxidizss, burning with great heat, eerving to still further liqnify the mass, and leaves it in tbe condition of mingled oxide and protoxide of iron, and oxide and protoxide of copper.

The communication with the reservoir of steam is then opened, whicb canses the mingled air and steam to pase tbrongb the molten mass. Tbe resnlt of thie is tbe conversion of the oxide and protoxide of copper into the protoxide of coppsr, and tbe protoxide of coppsr being heavier, falls to tbe bottom, and tbe protoxide of iron floats on its surface.

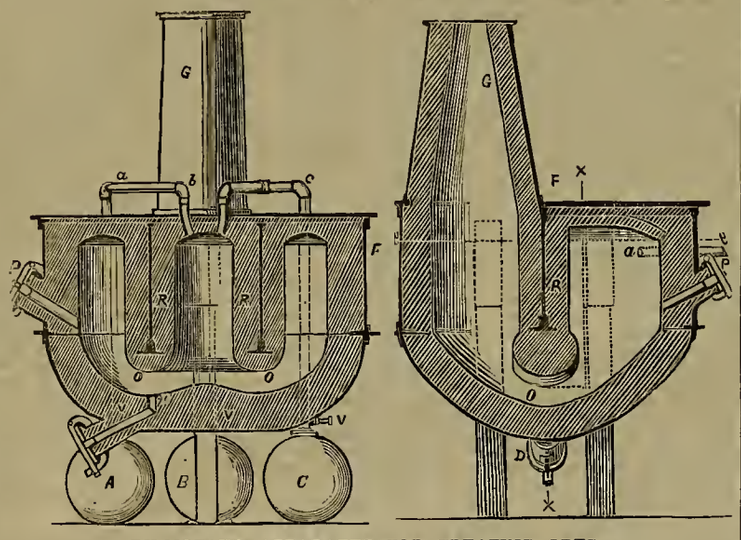
As soon as all tbe sulpbur has been oxidized, which ie known by tbe circnmetance tbat sulpburous acid ie no longsr formed, the supply of steam is cut off, and the third reservoir, containing the combustible gas, is put in communication with the closed end of the furnace. Tbis gas mingling with the air, which is bsing supplied through the pipe *C*, burns with great inteneity and tboroughly liquifies tbe iron and copper contained in the furnace.

The gas used should be one containing a certain amount of hydrogen, eitber free or in combination with a gas, and a certain amount of water in the condition of steam. Tbe supplies of ore and of combuetible gas are so regnlated that the resulting flame is a reducing-flame, the gae being in excese of tbe quantity which can be burned witb the air.

Tbe result of this operation is that tbe protoxide of copper is reduced to ths condition of metallic copper, bnt tbe protoxide of iron is not rsdnced, owing to tbe prssence of tbs water of combnstion. Whsn tbis bas besn thoroughly accomplished, the dslivery aperture is opened, and tbe mslted coppsr is allowed to flow ont through the aperture, *D*. The mslted protoxids of iron follows, and may bs recsived in a sspsrate receptacle, or may be allowed to fall upon the top of tbs coppsr, from wbicb, wbsn cool, it is easily separated by a blow.

Figure 2 rspresents a modification in wbich an annnlar partition divides a cylindrical retort into two portions, the innsr one bsing clossd for the reception of gas, steam or air, hsfors referred to, and the outer, or annnlar chamber being in commnnication with the atmosphere by the cbimney, *G*. The gas escapes from the inner cbamber through the annular ohamber, *O*, and so into tbe atmospbere. Tbe operation is precisely similar.

Good Mine and Mill.—The Mayflower mine,



DU MOTAY'S APPARATUS FOR TREATING ORES.

belonging to tbe Bristol S. M. Co., Bristol dis. trict, Nev., is shipping ore to the mill tbat is running from $300 to $1,000 per tou. Tbe *Times* says: The clean-up made at the mill two daye ago for the last six days' run amounted to $26,000, the silver bars being stacked up like so much cord wood, reminding one of tbe palmy days of Pioche, when fine bullion could be eeen piled up by tbe tou. The mill bas been steadily rnnning for tbe past two montbs, and will this January show an output of over $120,000, something unprecedented in tbe annals of milling for a ten-stamp mill. If the crushing capacity was adeqnate for the amount of ore that could he extracted per day, the returns would foot np over $500,000 per month.

A Leak.—Last Saturday afternoon, says the *Enterprise*, a small leak occurred in the 12-incb pipe leading to tbe hydraulic pump at tbe Chollar-Norcross-Savage shaft from the big tank on the side of Mount Davidson. The water was turned off and the hole plugged. While the water was shut off, the engines were started up and tbe hydraulic pump kept going. The leak was so emall that it required a plug but half an incb in diameter to fill it. However, had it not been promptly filled, thie hole would have rapidly grown. Sand passing out through such a hole under great pressnre fast eats away the snrrounding iron.

The Pacific Coast Mechanics' Educational Association, a society whose objects will be the diffusion of ussful knowledge pertaining to meohanics, by means of coursss of lectures and the formation of classes for instruction, bas been organized at the University at Berkeley.

Miners' Wages.

Periodically tbs question of tbe reduction of wages on the Comstock comes up for discnssion, tbs plea being eacb time that wages of common minsrs must be reduced in order to make tbe mines pay. In looking nver tbe reports of companiss, it usually strikes us tbat snch items as lsgal expsnses, sundriss, salaries, stc., go to swell ths expenses moro than tbey sbould. If sxpensss are to be reduced—and tbsy should be—ths top-heavy systsm of mining too much in vogue will be best rsmedied by taking off tbe weight from above. A trimming of salaries and rigid inspection of general expenses will serve a bstter purpose than cutting down tbe wages of the men who do the real work. Underground miners get none too much pay for the dangerous and laborious work they do.

Tbere are serious differences of opinion on tbis subject, it is trne; but most psrsons will agree that every effort ought first to he made to prune off the useless or superfluous dependents, and spend tbe money mainly witb tbe producers, before cutting down the bard-earned wages of these men. The Reno *Gazette* brings rather a curious argument to sbow that the mining kings do not care much about the matter. It says: "The situation on the Comstock is becoming snch that a reduction of wages is very londly and gensrally called for. It is usually held that the bonanza firm must make the fight against tbe Union, but we doubt if they care whether wages are high or low, as all the miners deal in etocks, and all their money comes into the bank sooner or later. If wages are high, the men engaged in all the mines on tbe lead have mooey to spend in stocks, and only a part of tbis would be saved to the firm if wages were lower, as they have only balf the mines. The pressure against higb wages must come from the people. They must refuse to pay assessments until they see the mines being run with eome chance for profit. As long as they pour money into the market at tbe top, Mackey and Fair can afford to hold the sack open and catch it as it drops out at tbe bottom."

Miners' State Convention.—Tbe State Miners' Association contemplates, as soon as tbe trial of tbe Gold Rnn case is concluded, to call a convention of the miners of California, to consider ways and msans for the common defense of tbe mining interests and rights. All miners will bs invited to attend, irrespective of tbe character of the mining they are engaged in, as tbe continued and pereistent attacke make upon hydranlic mining are coneidered as placing tbe whole mining iudustry in jeopardy in this State.

Academy of Sciences.

The North Winds.

Tbs regular ssmi-montbly meeting of ths California Acadsmy of Sciences was held on Monday evening, Dr. Behr in the chair. The following were proposed for life membsrs: Walter E. Dsan, John G. Kellogg, A. W. Manning. For resident members, Charles E. Apponyi, Robert G. Hooker and Hsnry Farrar, M. D.

The donations to tbe museum were as follows: From J. H. C. Bonte, cast of a stone implement unsartbed on the University grounds at Berkeley; from Carl Purdy, an Indian pips from Modoc county; also, tusk of n wild boar killed near Ukiah, Mendocino county, Cal.; from Ignatius E. Thayer, pectoral fin or wing of a flying-fish, which flew aboard bark *Annie Johnson;* from T. S. Williams, large bone of a wbale, partially decomposed, and encrusted witb barnacles; from J. A. Richardson, Indian bonee from a cave on McCloud river; from Edward Holland, sea urcbins, found on the mud flats at Wilmington, Cal., or a kind not before observed along the California coast; C. P. Converse, amber from Visalia, Tulare county; Dr. Wm. P. Gibbons, earth or fibrous gypsum spar; Gov. S. Purdy, four specimens of silver ores.

Dr. H. W. Harkness read a paper "On tbe Vegetable Cell, with Some Remarks on its Life History." Tbis paper we sball shortly publish.

In the course of his remarks Dr. Harknsss stated that it was bie opinion that the damage to plsnts done by our northerly winds, was not due to actual desiccation in drying up tbe sap, but to some peculiar electrical condition, wbich arrested the cell growth. Before such nortbers plants sbrivel, curl and show signs of great distress, but with the return of soft, moist magnetic breezes from the equator, they soon resume their fresh and vigorous appearance. Tbese cbanges are far too sudden to bs due to eitber desiccation or absorptioo, but are attributable to a temporary cessation of cell rotation, indnced by electrical disturbances, which we know take place during tbe continuance of our nortberly winds.

Mr. C. D. Gibbes, C. E., remarked tbat when surveying during our north winds, in tbe San Joaquiu valley, the eleotrical distnrbance was eo great as to cause the needle of his compass to fly up against the glass and become nseless during the first part of the day, when in the field; but that if he took the same compass into a warm, moist room, it again acted normally. Engineers in Santa Clara and Calaveras counties report the same action and dip of the magnetic needle during the prevalence of our dry nortbers.

Dr. Harkness said the nortbers affected tbe human ekin. They caused an uneasiness, wbicb results in dog fights, runaway borses, cross dispositions, pallid faces, etc. Dry atmosphere is a perfect non-conductor, but all moist plants and animals, as well as men, then become so many miniature lightning rods. Tbe nervss are at snob times continually irritated by a constant succession of tiny blows, like telegraphic ticks, against the nerve centers. Tbey contract and produce a congestion of the organs; the blood becomes turbid, while kidneys, liver and lungs all suffer.

Dr. Henry Gibbons, Sr., thongbt this electric action more subtle than from any apparent mecbanical evolution of electricity from friction of the passing wind over the surface of the earth. He said all persons felt cold, for it drove the circulation from the surface to the ioterior of tbe body, as Dr. Harkness so beautifully described 20 years ago. Its affect on certain diseases has been marked. The death-rate bas been claimed to increase at such times. He bad a patient whose eyes always blinked and snapped during a north wind, even in a warm, moist room, entirely protected from direct contact with the wind.

Dr. Harkness said we were always surrounded by electricity, but did not perceive it until its equilibrium was destroyed, when it became manifest. In some parts of India silk uoderclothing is necessary to comfort, at certain altitudes, during dry north winds, and in other parts no relief is found in this clothing.

Dr. Kellogg read descriptions of two new plants.

The Effects of Pent-up Gases in Mines.

The peculiar results arising from the liberation of large quantities of gases in mines are amongst the most singular phenomena met with in mining. But whilst we are frequently made acquainted with some of their effects, there are no reliable data as to the cause of the many heavy and sudden issues that take place. It is known that the movement of the column of the barometer was the effect of a cause which must precede such movements, that cause being an increase or decrease of pressure in the atmosphere; and upon the pent-up gas in our coal seams we are taught to believe the pressure plays an all-important part, so that, when the barometer is high, the gas is forced back into the pores and fissures of the coal, and, when the barometer is low, the gas issues in large quantities. But the depression or rise of an inch rarely takes place in a short space of time. Yet, without the slightest indication, a vast volume of gas will escape, filling the working places for a considerable length with gas, which, mixing with the air, however large the quantity, renders it in the highest degree explosive. But what we would more particularly draw attention to is the vagaries of the gas under great pressure, in some instances more than 150 ft. to the square inch. When a sudden discharge takes place, it is sometimes preceded with little noise; at other times there will be a trembling of the floor; it will then heave up; there will be a loud report—probably the rock breaking above. The men, greatly alarmed, rush to the bottom, and the place is entered carefully and examined, and the probability is that the gas will continue to issue—it may be for many days, or even weeks, even when the place it is believed to come from is sunk down to and opened out. In nearly all cases there is a heaving of the floor and a swaying of the roof, so that the two sometimes meet. At one mine in Derbyshire, 1,000 yards of the bank face were lifted up to such an extent that a person could not put his hand between the roof and floor, although the bank face was six feet in hight. The heaving up of the floor, however, shows how great is the force of the gas, coming as it does from a considerable depth, and by which props and iron work are ripped up and twisted. At the Benwell's colliery, in the north of England, at one time, it was not an uncommon thing for the gas to burst from the floor, and throw up vast quantities of stone, the gas having to be piped away.

In a recent case where gas was suddenly given off, a fissure was found both in the floor and roof at an angle of 25°, and for a considerable distance. At the Ryhope collieries in the north of England, a gentleman connected with them has stated, that it was not at all an uncommon thing for him to be thrown off his feet when walking along the face of the coal from the sudden heaving up of the floor, owing to the gas below. At the Pelaw colliery, many years ago, four yards of coal were worked and four yards were left. After a lapse of many years the owners were working the remaining four yards where the coal was considered ungettable when it was originally worked. They found that the floors had been pressed up, and that it was as solid as it possibly could be; that the roof was good and uniform, and that the whole space which had been occupied by the four yards of coal taken away had been filled up by the floor pressing as close as if it had been naturally found so. The probability, however, is that the floor in the case just alluded to was a sort of clay. In many cases the floor has upheaved when the roof has not given away. At one place, where there was an outburst, the staple sunk with the floor to a depth of 14 ft., and about three yards of hard stone had been passed through. Again, water is sometimes found to accompany the gas, and at a colliery in South Yorkshire, the floor was found to rise gradually to the top, and immediately the water got into it, it swelled like lime. In one instance, the level, after an outburst of gas, was flooded with water to a depth of from 18 inches to 2 ft., and the gas and water continued to flow for four days, although no gas or water had been in the place previously.

Perhaps the most singular explosion that has been recorded, is one that took place not very long since in Belgium, in the sinking of a shaft, before the men had reached the coal measures. The men were engaged in sinking, there being a platform for them to work on. They were working in permian strata, when some shots were fired, followed by an explosion, the result causing great displacement of timbering up to 90 yards; and above this point, quantities of stone and sand were thrown open. Upon clearing the debris at the bottom, an unconsumed dynamite cartridge was found. Three out of four men were killed, owing to rupture of the capillary vessels of the lungs through a sudden and violent increase of air pressure. The gas, on analysis, was found to contain no less than 93.47% of nitrogen, and 5.79% of carbonic acid. The probable cause of the explosion seems to be that hollows in the strata immediately above the coal measures were filled with gas given off by the coal, where it was stored up under great pressure, until, in the course of the sinking, the walls of a principal reservoir were sufficiently attenuated as to give way explosively, and after this burst the gas continued to escape for several months through the ground loosened by the first blast. Here the gas was not inflammable, and consequently incapable of causing an explosive mixture, but was comparable to the bursting of a boiler or air receiver under excessive strain.—*London Mining Journal.*

The Ventilation of Long Tunnels.

Herr Wilhelm Pressel has circulated a lithographed paper on this subject among his friends and colleagues; and as it is a question of daily increasing importance, we reproduce his most important suggestions. He begins by pointing out that the direction and intensity of the current of air in a tunnel are the product of numerous factors; that is, the length and dimensions of the tunnel, difference in level of the two mouths, average temperature in the tunnel, temperature of the external air at the mouths, pressure and moisture of the same, direction and strength of the prevailing wind. The effect of the latter group of factors may be either to intensify or to neutralize the natural action of ventilation set up by a difference between the level of the two mouths. The interior of a tunnel situated in a high mountain district, and passing under a vast mass of rock, will always be warmer than the outside air, especially at night, when in the Alps the temperature always falls. The warm internal air will, therefore, ascend the slope, and issue at whichever mouth is highest, and the cool air be drawn in from without to supply its place. Evidently this natural ventilation will be stronger in proportion to the difference of level of the two mouths. But the increase of this difference means increased steepness in the tunnel, and consequently increased production of smoke, and an intensifying of the evil to be cured. Moreover, as was before said, an unfavorable combination of external circumstances may destroy all the benefit to be derived from a steep gradient, and leave only the ill effects. This is the case at the Mont Cenis, where the difference is so great as 140 meters (nearly 460 ft.), but where the natural current is from these causes extremely weak, and often fails to produce any through draft at all, the smoke merely shifting backward and forward, than which nothing can be worse. Nor has the mechanical ventilation succeeded in supplying the deficiencies of the natural. Herr Pressel states that the loss of power in the air-compressing machines is so great that, instead of sweeping out the tunnel, they barely succeed in sending their current sufficiently far into the interior to keep the refuge chambers for the employees clear of smoke; and the apparatus more lately erected for pumping out the vitiated air is very ineffectual. He therefore concludes that natural means are insufficient for the ventilation of long tunnels, and that mechanical means have failed, and proposes instead a system not hitherto tried. It is obvious that a current is caused by varying specific densities of air at various places, the heavier air being drawn along (popularly speaking) to take the place out of which the lighter has arisen. If, then, a distinct difference can be established and maintained between the specific gravities of the air at the two ends of the tunnel, a steady current can be relied upon. This may be done by condensing the air at one end or rarefying it at the other, or doing both together. The second plan has often been adopted. Shafts have been sunk into the tunnel at each end, and the air in one has been kept heated by fires, so that there was a continual indraught of outside air through the other. The objections to this method for long Alpine tunnels are, first, the expense of the apparatus and fuel when used on such a large scale; and, secondly, the radiation of heat from the walls of the tunnel itself, when this is pierced through an immense mass of rock, which makes it necessary that the air brought in should be not only pure but cold. The author proposes therefore to adopt the reverse process, and cool the air in one of the shafts by means of falling water. Railways always approach Alpine tunnels along high valleys, which invariably contain mountain streams of very low temperature. The means of refrigeration are therefore at hand. Herr Pressel considers that a stream of about 100 gallons per second falling through the shaft would cool the air sufficiently and establish the current, for which he believes that a difference of temperature of 10° Cent. between the two shafts would be all that would be necessary. The upper openings of the shaft should be protected by revolving iron shields from the disturbing effects of wind on the ventilation. The mouths of the tunnel should be closed to allow this system to work properly, but need not be absolutely shut. Arrangements should be made for closing the shafts, and either wholly or partially shutting off the water supply, and there should be a special system of telegraphic signals for the purpose, so as to keep the whole system under control and enable it to be worked according to the varying conditions of the atmosphere. In very cold weather the supply shaft should be closed altogether, and the corresponding mouth of the tunnel opened, when the cold air will flow in of its own accord.—*Engineering.*

What is known as the Burgess Ranch Placer case, involving the title to about 23 acres of mining land situated in Shasta county, Cal., has been decided in favor of the applicant, Geo. Simmons. The decision takes the ground that as Simmons had occupied and worked the claim since 1869, he should receive a patent under the statute of limitations of the California mining laws.

All the mines of South America and Mexico, in the palmy days of Potosi, Cerro de Pasco, Cartorce, El Doctor and Pachuca, never furnished as much silver annually as was produced last year by the mines within the United States.

Furnaces vs. Stamps.

The Leadville *Chronicle* says: "The question of the future supply of lead ores is becoming a very serious one for the smelters. At the present time, it is only by increasing the number of furnaces, and thus increasing the proportion of work done to that of fixed expenses, that the smelters manage to make a profit, so sharp is the competition among the six smelters for ore carrying a suitable proportion of lead. If the owners of the Iron mine and the Morning Star should at any time take an idea into their heads to curtail their production, the consequence would be very grave indeed. There was a time in Utah when the smelters worked for nearly three years without making any profit, each expecting to wear out the others, and to secure a monopoly of the market. The indications all around us are that the ores of the future will be more generally milling than smelting ores, and the milling processes possess advantages over the smelting process which all will recognize. A properly constructed mill, managed by a competent man, is less likely to lose money than a smelter, and it ought to be able to handle almost every variety of ore except those which carry so much lead as to be especially adapted to smelting. With the exception of the ores of Red Cliff, most of the ores which are now being discovered in the outlying camps are better adapted to milling than to smelting. It ought to be possible to reduce them in a mill at a moderate expense and with only a moderate loss in the tailings. So many mills, some of them of larger capacity, are now being constructed that improvements in the machinery ought to be of weekly occurrence. If a sufficient number of stamps were set up in and around Leadville, the product of the camp would be much increased, and ores now practically worthless would acquire a mercantile value.

Our Alaska Territory.—Paymaster Kiog and Master Hames, of the United States Navy, published in the Washington *Post* an article taking issue with Prof. Elliott, of the Smithsonian Institute, in regard to the population and resources of Alaska. They say they have been stationed in Alaska for 26 months ending last August, and have personally traversed the whole of the southeastern section, and instead of the total number of white inhabitants of Alaska being only 392, as Elliott asserts, they confidently declare that there are about 500 whites at Harrishurg, 250 at Wrangel, 200 more at Sitka, not including the 250 Russians creoles there who are entitled to be classed as whites, and numbers of others at more than half a dozen smaller settlements where whites are found in companies ranging from 3 to 4 up to 15 and 20. They also say it is the greatest mistake to assert that nothing of value in minerals has been discovered in southeastern Alaska, and add that from Harrisburg settlement, not yet a year old, over $50,000 in gold dust has been sent below, and sales of quartz veins have been made at high figures, with a view of working them next season. Enough has been done to show the great value of the placer ground and exceeding richness of mining of the ledges, and it is certain there will be a large addition to the population next spring. They add: "Further, we know that the agricultural prosperity of that section is rapidly developing, and that the climatic difficulties in the way of it are far from insuperable. Further still, there are now measures on foot to develop the timber interests in one kind, of which the yellow cedar is so valuable and so abundant in Alaska. Neither Washington Ter., Oregon nor British Columbia can compete with Alaska."

South Yuba Tunnel Co.—The tunnel being run by this company at Hoyt's Crossing, on the South Yuba river, is now in some 240 ft. under cover. Work is being pushed rapidly ahead, under the efficient superintendence of Geo. T. Emery, general manager for the company. The tunnel, when completed, will be 900 ft. in length. It is of large size, the dimensions being 14x9 ft. A shaft is being sunk at the upper end, so as to permit of working both ways, and thus hasten its completion. The company contemplate putting in Burleigh drills, but not at present. The object of this tunnel is to divert the channel of the river so as to work out the rich tailings in the river bed. A large flume will connect with the tunnel, and can be extended along the bank for a long distance, thus enabling the company to work out a large portion of the river. It is only about three months since work was commenced, and when it is taken into consideration that much hard granite has been encountered, the company have made good progress. This scheme marks a new era in mining enterprises in this section, and upon its success will perhaps depend the inauguration of others similar to it. It is believed that the project will prove successful, and that the Yuba Tunnel company will be well paid for the investment. All work is being performed systematically and economically, and no money spent needlessly.—*Nevada City Herald.*

Mining is not very brisk in Syskiyou county just at present, the river miners having nearly all pulled out for fear of freshets, and the placer miners unable to work by reason of the cold nights stopping the flow of water for good sluice heads.

Henry A. Jones, brother of Senator John P. Jones, and a resident of the Comstock for many years, died at Virginia City last week.

An Experience for Smelters.

The Leadville *Index* says: People who propose to erect new smelters to treat ores in the outlying camps, can learn a useful lesson in studying the history of the Robinson smelter. These works were erected by the late Lieutenant-Governor Robinson, who devoted considerable time to studying smelters here and elsewhere before he decided on his plan. He consulted everyone whose advice seemed likely to be of use, and it was his hope and calculation that he would have a model smelter. After his death George Daly contributed to the works the knowledge of smelting he had acquired in Nevada and California, and his plans were again improved upon by Thomas Ewing. When the works were complete, the best available talent was secured to run them. Any amount of capital was furnished to secure their success. At the time they passed into the hands of the Robinson company, they had cost $78,000, at which figure they appear as charged in the company's balance sheet. Mr. Ewing, however, had not run them many weeks before he became satisfied that they were a failure and blew out the furnaces. Why? If the Argo works can treat Robinson ore, why could not the Robinson smelter do the like, and save all expense of freight? The answer to this conundrum must be this: Large smelters, buying large quantities of different ores, and accustomed to treat mixtures, can handle ores, which separately are almost too refractory to be reduced. If the additional question be put, why couldn't the Robinson company buy ores to mix with theirs as well as Argo and La Plata, the reader must furnish a reply. As a general rule smart men do one business well, and when they embark in another, they are very apt to make a failure. Local smelters, built to reduce one kind of ore, will generally land where the Robinson smelter is—in silence, dullness and gloom.

Ventilating Tunnels and Mines.—The invention of Mr. A. J. Gonlstone of Tottenham-road consists in constructing a shaft through the arch of the tunnel, and inserting therein a wrought or cast iron pipe or tube, varying in length from 4 ft. to 20 ft. or upwards, of the dimension of 12 inches, or more if necessary, in diameter; the placing of a gas-pipe of small size at the bottom of the aforesaid pipe or tube, from which a constant and continual flow of gas will ascend through the aforesaid pipe or tube, amalgamating with the noxious gases passing through a perforated copper or other metal gauze, or asbestos, or other suitable material, into a funnel or other shaped receptacle, from which it will pass through a coiled cone or other suitable means of transit, above which will be placed two small gas jets continually alight, thus setting fire to and consuming the foul air and gases, burning the same, and rendering them utterly non-deleterious to health. The whole of the upper part of the apparatus to be covered in and hidden from view by a shield of cast iron or other metal in an ornamental style; also the construction of a funnel-shaped zinc or tin collector at the bottom of the aforesaid pipe or tube to facilitate the draft from the tunnel through the pipe or tube before mentioned; likewise, the placing of a wrought or cast iron, or copper or other metal pipe along and immediately underneath the arch of the funnel of such diameter and of such a length as may be necessary to convey the foul air and gases to the aforesaid pipe or tube.—*London Mining Journal.*

Perils of the Lower Levels.—Last Sunday Russell Lamb, brother of Hugh Lamb, of the Bonanza mines, became overheated while at work in the Union Consolidated, and was brought to the surface and taken home suffering from cramps and in quite a dangerous condition. He was still very sick yesterday, but it is thought he will recover. Yesterday morning Philip Horton, working in the Sierra Nevada mine, was brought up from the 2500 level in an insensible condition and taken to his room at the Tahoe House. He was coming out all right at last accounts. It was also reported that a miner was brought out of the Bullion yesterday, who was suffering greatly from having become overheated. Men who have become overheated in the mines not only have terrible cramps, but also had shivering spells, shaking as though with a severe fit of ague. As there are at most of the leading mines bath-rooms well provided with both hot and cold water, about the best thing that could be done with a man who had been overheated would be to put him into a bath-tub filled with water as hot as his skin would bear, and thus at once rid him of his cramps and shiverings.—*Virginia Enterprise.*

The Flagstaff mine, which is on the same mineral belt, and supposed to be on the same vein as the Indiana, Swansea district, Inyo, is now being worked by sinking from the bottom of the old shaft, which is 140 ft. deep. About 20 tons of ore were taken out in sinking the shaft, which averaged 300 ounces of silver per ton.

A Big Nugget.—The Lyon County *Times* of last Saturday says: "Considerable excitement was created in and around Big Pine last week by the finding of a 21-ounce nugget. The fortunate man is a Mr. Cornell. He will give no particulars further than to say that he picked it up in the hills near Fish springs."

MECHANICAL PROGRESS.

American Manganese Ores.

In our last issue, a brief reference was made in this column, in regard to the small attention paid by the American metallurgists, toward utilizing our own rich manganese ores, in the production, at home, of ferro-manganese, which enters so largely into the composition of Bessemer and open-hearth steel. About 30,000 tons of ferro manganese are annually used in this country, of which amount only a very small portion is produced in the United States, while, especially in the Southern States, we have large quantities of the richest of manganese ore. So rich is this ore that it is shipped in large quantities to Europe, where it is worked and returned to this country in a metallic form, to be used in our Bessemer steel works.

Interesting Experiments.

That we can utilize this important item of industry, is fully shown by Willard P. Ward, who communicates to the *American Manufacturer*, the details of some experiments which he has conducted in this direction. The experiments were undertaken in a small charcoal furnace, and under many technical disadvantages, such as inability to heat the blast high enough, lack of sufficient volume and pressure of blast, and, finally, when the difficulties were in a measure overcome, the cracking of the inner and outer walls of the furnace, permitting the escape of the gases which should serve for heating the blast and generating steam. In other words, when a high enough temperature was obtained, the stack itself was not capable of standing it. Before the giving way of the stack the furnace produced about two tons per day of from 50% to 67% ferro-manganese, at a cost of about $50 per ton.

A furnace for the most economical production of ferro-manganese, says Mr. Ward, should be very much larger than the one in which the original experiments were made, and should be provided with all the modern appliances for working a very refractory ore. The amount of fuel required to reduce and smelt one ton of ferro-manganese, of say 60%, would make nearly or quite three tons of foundry iron. Hence the necessity for the best appliances to work with.

In three months' running of my furnace, 58 and a fraction of a per cent. of all the manganese that went into the top of the furnace in the shape of ore, came out at the bottom in the shape of metal. At Terre Noire, 60% of the manganese in the ore is said to be utilized, and 40% lost in the cinder. This seems to be a large loss; but when the very great affinity of the metal for oxygen is considered, it is not excessive. At any rate, if we can do at the start as well as Terré Noire, we may be satisfied. There they employ large furnaces, very hot blast, and coke as fuel. Adopting the same plan and using the same ore, I am satisfied that I can get as good results. In a small furnace, and under the difficulties mentioned, my work did not fall far short of theirs. The ores I employed contain about 45% of metallic manganese, and were smelted with the addition of some iron ore. Nearly three tons of manganese ore would be required to make a ton of 75% ferro-mangenese, utilizing 60% of the contents of manganeee.

The following is an estimate of the cost of producing a ton of 75% ferro-manganese under favorable conditions, such as I have mentioned. It is a very liberal one, and can probably be improved on in practice. At all events, it is large enough to cover everything:

3 tons manganese ore, at $5	$15.00
3 tons coke, at 8 cents per bushel	12.00
1½ tons limestone, at $1	1.50
Labor and superintendence	6.00
Interest at 6% on investment, and repairs	5.00
Total	$39.50

It will be observed that the ore is reckoned to cost $5 per ton; a price at which it can certainly be delivered at the furnace. At the present time ore is exported in large quantities from the Georgia mines to Liverpool and Marseillee, where it commands from $18 to $20 per ton; and as they would not pay us more than they could purchase for from other quarters, we may rest assured that an American company can put into its furnace for $15 what costs from $55 to $60 in England or France. With this advantage, and an import duty of $7 per ton on foreign ferro-manganese, we certainly ought to be able to pay a little more than they for fuel and labor, and still make large profits at present prices. They certainly can not sell much lower, while we would have a large margin.

American ferro-manganese can, without doubt, be made and sold at a fair profit at a price per unit of manganese below that of speigeleisen. When that time comes it will be to the interest of all steel manufacturers, including those working the Bessemer process, to add manganese to their charge in concentrated form, and to recarbonize with some other material than speigeleisen; a plan which is universally admitted by steel men to be perfectly feasible.

THE MOST SERVICEABLE WIND.—A German manufacturer has figured out, mathematically, that in windmills, the most serviceable wind is one that blows at a velocity of 23 ft. a second. The fans of the windmill revolve with nearly double the velocity of the wind. The lowest number of days in the year that the wind is serviceable is 180, in that vicinity, and the greatest number is 280.

Belting Facts and Figures.

Rubber belts drive better than leather, and leather better than unprepared canvas. Wooden pulley faces and those covered with rubber or leather drive better than cast iron. Large pulleys drive better than small ones having same rim speed, because they have longer belt wrap, hence more area of contact. This increase of driving power is not directly proportional to the increase of pulley diameter. Wide belts drive better than narrow ones, because they have wider contact, hence more gripping area. This increase in driving power is not in all cases proportional to the width of belt. The greater the arc of contact the better the drive, because of the increased gripping area. The driving power is not directly proportional to the arc of contact. Double belts will carry more power without being strained than single ones of the same width, but *not* twice as much. The larger the pulley, the greater the proportional increase of driving power of double over single belts. The greater the tension, the greater the driving power, but the driving power is not in direct proportion to the tension. When belt is too slack it flaps and loses driving power by slipping, but the loss of motive power—that is, the fuel or water used—is not as great as the loss of driving power.

Beyond a certain tension it is not desirable to go. Excessive tension, while increasing the power of the belt, causes wear of the journals and bearings, waste of oil and loss of power. The best average practice seems to be 45 lbs. of tension per inch of width of single leather belts. Where there is too little bearing surface, there can be less tension than where there is ample bearing surface of proper character. No kind of oil should be allowed to touch rubber belts. Leather belts are best greased with castor oil.—*United States Miller.*

MALLEABLE IRON, ETC.—M. Forquignon has published an extensive series of researches upon malleable iron and the reheating of steel. Among other conclusions he attaches special importance to the following: 1, Malleable iron always contains amorphous graphite; 2, a casting may lose carbon and yet remain brittle if the original quantity of graphite is not increased; 3, a casting may become malleable without losing any sensible portion of its carbon; 4, if silicium is added to manganesian castings, they are improved by reheating; 5, hydrogen and nitrogen may unite with the carbon of a casting so as to make it malleable without the production of graphite; 6, the breaking load is always more than doubled, sometimes more than quadrupled, by annealing. It increases with the duration of the heating, very rapidly at first, and then very slowly; 7, ductility generally increases with the resistance to breaking, but after a certain limit it has a slight tendency to diminish.—*Ann. de Chim.*

FOR THE PRESERVATION OF BELTS.—*Wood and Iron* gives its readers a recipe for the preservation of belts: Resin oil and 10% of mica. Resin oil will make a belt grip for a little while, and then put a glaze on it, making it necessary for another dose of oil, etc. If it is a leather belt, resin oil will make it stiff and harsh, and cause it to slip and crack. Resin oil is not a "grease," as stated by *Wood and Iron*. It is more of a varnish. It is used to make cheap grades of printers' ink; being ground up with lamp-black in roller mills. Mica is recommended as a lubricant for heavy journals, and has no place on a belt. *Wood and Iron* says that a belt coated with resin oil and mica is not affected by "corrosion," whatever that is. Our Eastern belts never "corrode." Boilers sometimes do. We have known belts to *rot*, but never to "corrode."—*United States Miller.*

WATER IN STEAM.—Herr Stoupler, of Lucerne, Switzerland, by adding fluorescence to the water of a steam boiler, which, by calorometric tests, enables him to detect the presence of one-half of 1% of water carried mechanically out of the boiler by the steam, found that from ¾% to 4% was actually true present in the steam. The deep green color of the water in the boiler was retained in it for weeks, and yet no trace of coloring could be detected in the water condensed in the steam cylinder, a proof that the water which gathers there is entirely due to condensation caused by the expansion of steam, and very little water is actually mechanically carried away by the steam from boilers.

NEW USE FOR SHEET IRON.—An inquiry has been started as to the possibility of using sheet iron as a covering for cotton bales. The present hemp or flax covering is used solely on account of its cheapness; but as it admits moisture and sand, it causes a considerable waste of cotton in the course of transportation. A number of heavy cotton dealers of Memphis, Ky., have written North for quotations on No. 30 sheet iron. If the change should be generally made, it will produce an enormously increased demand for that material. Each bale will require a sheet 76x44 inches, with a weight of 22 lbs. The annual crop of cotton would absorb 66,000 tons of sheet iron.

A NEW AND IMPORTANT CEMENT.—It is said that Dr. Gehring, of Landebut, in Bavaria, by means of an enameling liquid, renders any species of stone or cement harder than granite. The process, it is further reported, admits of being applied to metal, which is completely protected from rust.

SCIENTIFIC PROGRESS.

Wind Pressures.

The wind pressures experienced in India are remarkable. On October 5th, 1864, on the Eastern Bengal railway, two trains were upset during a violent storm. One of these was a train of eight passenger vehicles, and was upset near Echapore. The other was a train of twelve passenger vehicles, and was upset near Arrunghatta. In both cases all the passenger vehicles were blown over on their sides. Besides these carriages, four wagons were blown from a siding at Buggoolelo, and capsized about half a mile north of that station on the same day, from collisions caused by wagons which were started from sidings from the force of the wind. On Sept. 21, 1878, a long train of wagons traveling at about eight miles an hour, on the Eastern Bengal railway, was brought to a standstill by a heavy storm, and was then forced back about a mile with full steam and brake against it; 18 wagons were then detached, but even with half the train it was found difficult to continue the journey. On Nov. 20, 1880, at Negapatano, on the South Indian railway, an empty covered goods wagon was upset by the wind while standing at rest in a siding. Numerous instances have occurred on the Indian railways of trains being stopped, or nearly so, by the force of the wind.

The wind pressures above alluded to are certainly very remarkable for continuous pressures; but in the exceptional cases of tornadoes, such as those which passed over portions of Kansas and other States in that vicinity during the two last seasons, the pressures were far in excess of anything related of India. If the accounts are reliable large animals, such as horses, were lifted completely from the ground and carried long distances in the air; human beings were lifted in the same way and dashed to death. Houses were utterly destroyed to their foundations and their timbers and boards scattered far and wide over the adjacent fields. Electricity doubtless has much to do with the violence of such tornadoes.

USES OF CHLORIDE OF MAGNESIUM.—A German polytechnic journal gives an interesting account of the uses of chloride of magnesium, for which body a patent has been lately obtained as a non-solidifying liquid when subjected to the action of freezing agents. Among several examples, this journal mentions its application in increasing the weight of yarn, this material absorbing large quantities of the liquid. Legal measures have, however, been adopted for the prevention of this proceeding, which, it is hoped, will be successfully suppressed. In Starsfurt the chloride of magnesium, which constitutes the greater part of the waste material of factories, and which formerly was allowed to flow into the passing river, has for a number of years past been used in the preparation of magnesium blocks for the lining of puddling furnaces in the process of dephosphorizing iron. On account of its fireproof qualities it is a much-prized material for this purpose.

PARABOLIC REFLECTING SURFACES.—M. Catchinoff has introduced a very ingenious method of constructing perabolic reflecting surfaces, by applying the principle according to which the surfaces of liquids when revolving about a vertical axis assume a parabolic shape. If a liquid is taken which after some time solidifies, a permanent paraboloid may be obtained. The inventor fixes a semi-spherical basin on a vertical axis capable of being revolved, and pours into the former a sufficient quantity of plaster of paris mixed with water. One of the essential requisites in the process is perfect uniformity of motion, for which reason the use of the steam engine as a source of motive power must be discarded. A small Gramme machine, or a Siemens dynamo-electrical machine will, however, answer the purpose admirably. The liquid used should possess slow solidifying and little contracting properties. Parabolic surfaces constructed in this way may be coated with silver or any other reflecting material, and will be found to yield satisfactory results.

THE PENETRATING POWER OF LIGHT IN WATER.—The limiting depth to which light penetrates in water was some time ago stated to be 40 metres for Lake Leman, by Prof. Forel, who used albumenized paper in his experiments. M. Aeper has recently made similar experiments on the Lake of Zurich by a slightly different method. He used the photographic plates called *emulsion plates* (more sensitive than albumenized paper), and immersed them during the night of August 3d, to depths of 40, 50, 60, 70, 80 and 90 meters. They were brought up after remaining 24 hours in the water, and treated with oxalate of iron. All the plates, without exception, were distinctly affected by the light. Thus the chemical rays penetrate in clear water to at least 90 meters deep.

A DELICATE TEST.—Griess' test for nitrous acid in water is so delicate as to detect one part in 1,000,000,000 of water. The water is acidified, and some anilphanilic acid with some hydrochlorate of naphthylamine added. If nitrous acid is present a rose-red tint is developed.

Tracing the Storms.

The matter of a Signal Service system for the Pacific coast, by which we may be enabled to fix their entrance on this coast and trace their direction, has long been talked of and desired. The prospects are now that the system will soon be inaugurated. Lieut. C. H. Kilbourne has recently returned from a trip north, where he went to select sites for the establishment of the new Service stations, which it is thought that Congress will this winter appropriate funds for. He reports as the result of his observations that the general path of storms upon the Pacific coast is from the west eastward, with a southeasterly trend. The storm center strikes about Victoria, and the southern outer circle of the storm usually strikes Cape Flattery, the most northwestern point on our territory, first. The full force of the storms is felt in British Columbia, where the winds work great ravage. Therefore, a station upon Cape Flattery would give the first indications of approaching storms. For this reason Flattery is chosen as one of the proposed posts. Another station will be established at the mouth of the Columbia or on Tillamook rock.

Another point that the lieutenant is specially instructed to investigate is at Cape Mendocino. The benefit arising from taking observations at those points can hardly be estimated, as the whole system of calculations must be based mainly upon them. There are now but two coast stations—that in this city and the San Diego station. It is thought that in addition to these stations, another will be established at Cape Disappointment. In the event of an appropriation being passed for these stations this winter, an independent coast weather service will be inaugurated here, the observations of which will eventually add much to the general knowledge of the meteorology of the Pacific coast.

EFFECT OF COLORED GLASS ON LIQUIDS.—A German scientific journal recently published an article on the effect of the color of glass bottles on the liquors contained therein, in which the following interesting statements were made: Liquors contained in colorless bottles, when exposed for some time to the light, acquire a disagreeable taste, notwithstanding the fact that they may have been of superior quality before being so treated; liquors contained in brown or green bottles, however, remain unchanged in quality, even if exposed to direct sunlight. This phenomenon has not received proper attention heretofore, and quality has often been sacrificed for the sake of outward appearance. Since the results of the above treatment are due to the chemical action of light, it is advisable to use red, orange, yellow, green or opaque bottles for the preservation of liquors, while colorless, blue and violet ones should be entirely discarded.

SEPARATE SOUNDS ON ONE WIRE.—M. Maiche has found by experiment that sounds of different characters produced from two separate sources can be sent simultaneously on one wire and received seperately. He used at the receiving station two telephones of different resistances, and at the transmitting station caused a musical box to be set going on a microphone of small resistance, while an induction telephone transmitter was spoken into at the same time. The musical sounds were reproduced in the telephone which had the least resistance, and the vocal sounds in the other, so that with the two telephones to the ears the music could be heard by one ear and the speech by the other.

A GREEN METEOR.—The Griffin, Geo., *News*, of a late issue, says: "Some evenings since we saw one of the most wonderful meteors that ever brightened the surrounding hills. It was some time between the hours of 11 and 12 o'clock; we were quietly meandering home from the sanctum, when suddenly a bright rosy light loomed up directly from the southern horizon, and shot with a flash toward the northeast, at an angle of about 70°. When about midway of the heavens the color suddenly changed to a rich green."

WHY GRASS WILL NOT GROW UNDER TREES. M. Paul Bert has shown that green light hinders the development of plants. Plants inclosed in a green glass frame wither and die as though they were in darkness. M. Regnard finds that plants specially require the red rays. If sunlight is deprived of the red rays, the plants soon cease to thrive.

INTERESTING DISCOVERY.—Some fine carvings in ivory, discovered at Nineveh, showed signs of crumbling on arriving in England. Prof. Owen concluded that the decay was caused by loss of albumen in the ivory, and therefore boiled the articles in a solution of albumen. The experiment was a success, and the ivory became as firm and solid as when first entombed.

FREEZING ALCOHOL.—The question has been asked whether it is possible to freeze alcohol, or pure whiskey. Alcohol could doubtless be solidified, but it would require a temperature lower than any yet attained by artificial means.

THE report of the Secretary of the Bald Mountain Mining Company (drift mine), for the month of November shows that the yield of the mine for that month was $6,014.25, while the expenditures were $5,714.75, thus leaving a balance for the stockholders. This is a good start towards declaring a dividend.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Horn Silver, Jan. 8th, $15,500; Pascoe, 8th, $1,500; Jay Gonld, 8th, $2,200; Mayflower, 8th, $2,300; Hanauer, 10th, $4 570; Leonore, 8th, $460; Germania, 8th, $1,400; Germania, 11th, $6 400; Pascoe, 11th, $1,450; Horn Silver, 10th, $80,000; Horn Silver, 13th, $27,500; Germania, 13th, $6,500; Hanauer, 13th, $4,550; Germania, 14th, $3,550; Northern Belle, 9th, $4,276; Standard Con., 9th, $35,020; Contention, 9th, $19,556; Star 9th, $2,335; Day, 10th, $6,000; Northern Belle, 11th, $4,308; Bodie, 16th, $6 784; Leeds, 16th, $1,563; Eureka, 9th, $9,826; Silver King, 14th, $17,000; Manhattan, 13th, $41,450.

RICH mineral discoveries have been made eight miles southeast of Wilcox, A. T. The ledge runs nearly east and west, and is reported from 6 to 12 ft. wide. Specimens of ore from this ledge assay from $600 to $12,000. Prospectors are daily arriving at the new district in large numbers. The district has been named Cochise.

MINING SHAREHOLDERS' DIRECTORY.

Compited every Thursday from Advertisements in Mining and Scientific Press and other S. F. Journals

Mining Share Market.

There is very little of interest in the "Mining Share Market." In fact, the San Francisco Stock Exchange has so little to do that it is considering the feasibility of adding the business of wheat buying and selling to its regular business. Mr. A. H. Lissak, one of the committee appointed by the brokers, on being interviewed by a reporter, says of the scheme: "There is no reason why we should not successfully annex to our business the business of speculating in wheat on the Chicago plan of operation. We are in close business relationship to the speculative element in the city which would take advantage of the opportunities of buying and selling any quantity of wheat, as the probabilities of a decline or fall in the market. It would be a great advantage to the wheat growers, as the business is now conducted by a small number of shippers, who really set their own prices on wheat and buy through agents distributed over the wheat districts. If a properly-organized Wheat Exchange was to be conducted by our Exchange Board, the farmer and grower would have the advantage of open and constant competition. Take the present time, for instance. During the prevalence of this dry weather there are many speculators who would gladly invest on the prospects of a rise on the strength of a dry season and short crop this year. It is too early for me to express an opinion on our probable line of action. But, possibly, if we should report favorably on the proposition of annexing the wheat business to our list, we might devote the morning sessions to mining stocks, and the afternoons to the wheat business. If there is anything in the business, we will, as a Board, probably be able to take care of it. I do not mean to say that there is not ability enough on the Produce Exchange to manage the wheat business, but we have the advantage of experience, the patronage of the speculative element, and possibly the required capital."

Mr. Lissak is a member of the San Francisco Stock Exchange, and also has, through his business associate, Mr. White, a seat and privilege in the Produce Exchange; and, as he has paid some special attention to the business of wheat speculation in this city, his opinion that the Mining Exchange is capable of controlling the wheat business is of special interest.

All work is progressing well at the north end of the Comstock, but the drifts are kept well to the west of the vein, for fear of running into water. Until crosscuts are started into the vein, it is not likely that any move in stocks will be seen.

At the Savage, about the only work being done is on the raise which is being made from the 2400 level to connect with the bottom of the main incline. Upon this work, the whole force of miners is now concentrated. It will not only be a very important connection for the Savage, but also for the Hale & Norcross, and all the other middle mines. Already the work that is being done below is draining off the water that had accumulated in the incline.

The hydraulic pump at the Chollar-Norcross-Savage shaft is now being run by natural flow and pressure of water. It operates so well that no fear is entertained that it will not take care of all the water likely to be sent to it.

The Yellow Jacket folks are drifting into fertile and very promising ground. All the seams and stringers of quartz cut are found to be mineral-bearing, though of low grade. They now have opened up, ready for exploration, a large amount of very interesting ground.

At the Imperial, they are again in shape to do prospecting work, and in crosscutting on the 2300 level have found numerous seams of quartz giving low assays.

THE COPPER REGION.—Henry Praeter, who has been prospecting in the Walker river region for some two months, has returned to this city for supplies. He says he has found a vein of copper ore some eighteen miles north of Wadsworth, on which he is willing to risk more money and more grub. Associated with him is John Harrison, a prospector of experience. Both Mr. Harrison and Mr. Praeter say they have a vein that is perfectly satisfactory and is as rich as they could expect as far down as they have gone upon it. Their vein differs from most of the copper deposits in that region in that it shows native copper from the surface down. They have not met with any heavy masses of native copper, but in going down on the vein they have constantly met with thin sheets of native copper in the seams of the rock. Some of these are very beautiful. Mr. Praeter shows some that are in the shape of oak leaves, others that resemble ferns, and some that have no particular shape. In a seam about six inches in width that follows the footwall they got excellent prospects in free gold. They have panned out as high as four bits to the pound in gold, but this gold does not appear to reach over into the copper part of the vein. In a thin seam against the hanging wall they get good assays in nickel.—*Virginia Enterprise.*

SPEAKING of Mint Director Burchard's report, the Trinity *Journal* says: The total production of Trinity county mines for the year is placed at $326,835, while the amount shipped from Weaverville by Wells, Fargo & Co.'s Express was alone $490,573.84, and which is generally conceded does not represent more than 50% of the actual production of the county.

THE amount of gold dust shipped through the office of Wells, Fargo & Co., at Auburn, for the year 1881, aggregates $281,379.

THE Rye Patch mill, Nevada, a 10-stamp outfit, was burned last week.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

ZEILE.—Amador *Dispatch*, Jan. 14: Most of the workmen at the Zeile mine had a day's rest last Thursday, owing to a break in the Amador canal, which necessitated the shutting down of the mill for the day. Work was resumed as usual in the evening.

KELLY.—We understand that rich rock has recently been struck in the Kelly mine, at Murphy's ridge, and that the indications for a rich mine appear more flattering than ever before. The mill for the mine is being pushed toward completion as fast as the weather and other circumstances will permit.

KENNEDY.—*Ledger*, Jan 14: At this mine there is a little prospecting going on. The mill is running on ore from the old dump-pile.

AROUND VOLCANO.—The Grass Valley hydraulic claim is running full blast, and has been so running for several weeks. The Golden Gate mill has not yet started up. The Downs mine is looking well, as rich in fact as it ever did. The twenty-stamp mill is kept running constantly. The Volcano tunnel company are all ready for active mining, but the water supply is yet too scant to start them going. The Modoc in Pioneer district is taking out rock. The last crushing paid handsomely, and the ore now being extracted looks quite as rich.

SUTTER CREEK.—Amador *Sentinel*, Jan. 11: The Sutter Creek sulphuret works suspended operations on Tuesday last, leaving only two in the county that are working.

CALAVERAS.

LEWIS AND FAIRCHILD MINE.—Calaveras *Chronicle*, Jan. 14th: This mine is one of the finest pieces of mining property in the State. It still continues to yield specimen rock of extraordinary richness, as it has done all along for the past year. In conversation with Mr. E. A. Lewis, one of the owners of the mine, we were informed by that gentleman that from rock crushed in a hand mortar alone, $1,800 had been obtained during the past year. The shafts sunk upon the vein have been carried down to a depth of between 80 and 90 ft and at that depth the developments are of the very best kind. It is the intention, we are informed, to run a tunnel from the gulch, which will not exceed 700 ft in length, and tap the vein at a depth of about 250 ft. By this means the rock can be extracted much more easily and the mine worked to better advantage. A considerable quantity of quartz is on the dump, soon to be milled, all of which will pay handsomely.

EL DORADO.

THE GOPHER-BOWLDER MINE.—*Mountain Democrat*, Jan. 14: They made another clean-up at the Gopher-Bowlder on the 4th instant, and will soon have 10 additional stamps and a rock-breaker in place. The mine is in fine condition for profitable operation. Good connection with the surface at the north end has been made between the new Gopher tunnel and the old incline. A branch from this tunnel makes a semi-circular sweep to the westward, curving to the northward, under the large mass of good ore that was prospected in the old-time workings. This tunnel also has been extended to the extreme northern line of the ledge, securing a large mass of good ore "backing" in that direction. It is safe to say that in the Gopher mine they have opened a body of ore that will keep the 20 stamps going for fully a year without doing any more "dead work." As all of this ore is extracted much more easily and the mine worked to better advantage. A considerable quantity of quartz is on the dump, soon to be milled, all of which will pay handsomely.

SALE.—Georgetown *Gazette*, Jan. 14: "The sale of the "consolidated" mine at Fraser flat for $50,000, and the Wildwood, a few miles east of town, for $7,000, as reported in this paper a few weeks ago, was no sale at all, as we have since learned. Mr. Bilty, of Greenwood, the person who assumed to have brought about the supposed sale, stated to us that such was the case. Our readers at a distance were thus deceived. The *Gazette* had actually lied to them. One party had written to a trusty friend inquiring into the truthfulness of our report. We are endeavoring to confine our reports of mines to facts, and hope hereafter that parties having an ax to grind will not thus impose upon us.

THE Cal. W. & M. Co. have now a force of men at work under Supt. Wolf, putting in a new dam at the head of Bear creek ditch and cleaning out and repairing the ditch from the dam down to Pegleg ranch, a distance of about 8 miles. The increased mining interest of that district demands this improvement.

SNEDER & FORNI have gone to work on their quartz claim, about a mile east of town. Last fall they took out pay until they closed down on account of too much water. They have just put in a water wheel and a pump, and are sinking on the lode. Success to the boys, for they deserve it.

MR. W. C. BAIRD, of the Eureka, arrived Tuesday from San Francisco, where he has been attending to the shipping of the mill, machinery, etc., for the Eureka mine, of this place. One load has arrived, and all will be on the ground this week.

MARIPOSA.

COULTERVILLE.—*Gazette*, Jan. 14: Our mining interests seem to be looking up of late, and as the Marble Spring mill has started up, we expect to hear of good results from that point soon. Mr. Piper, the "bosa" millwright in the southern mines, with a troop of carpenters is now putting up the buildings and machinery at the Black Hill, about 1 mile from this place, and as the machinery was all fitted up before leaving the machine shop, it will require but a few days to complete the job, when we will hear the sound of a steam whistle nearly in sight of our little town. Mr. G. Douglass is still prosecuting the work on the Maxwell creek, or Cook brothers' property, with flattering prospects. The work above here on the Martin & Walling and Bandarita mines is still moving along smoothly and favorably as I understand. There has been quite a number of re-locations since the first of the year, which comprises about all the mining news of this side.

MONO.

BODIE.—*Free Press*, Jan. 14: Without being called upon to record anything of exciting interest this week, it may be said that there is a steady and cheerful activity prevailing throughout the district, and that there is no diminution in the steady output of bullion. At the Red Cloud shaft there was during the last week a very strong flow of water, which is now considerably reduced in volume. The opening of these underground reservoirs of water are incidents to be anticipated at any time in the deeper shafts, and the draining of them is soon accomplished when such splendid facilities as the pumping machinery of the Red Cloud are brought to bear on them. Sinking will be resumed at the Standard shaft, the interruption having been caused by the breaking of the wine bore, which was being replaced by the Bodie foundry when it unfortunately burned down. The station at the 800 level of the Lent shaft has not yet been quite completed, but crosscutting will soon be commenced at that point. An ore dump is being erected at the Lent, which is a matter of some significance. Some very interesting ground is being crosscut at the Tioga mine, in the 982 level.

NEVADA.

HOMEWARD BOUND MINE.—Grass Valley *Union*, Jan. 10: The water in the Homeward Bound shaft was pumped out to a depth of 140 ft in the incline on Saturday last, but in

lowering the column the water gained 12 ft. There was a great deal of water in the flat through which the vein runs, and besides there is considerable ground opened by drifts and stopes, all of which have to be drained, and of course, some time will be necessary for the work. The 11-inch pump is doing its duty well and in due time the mine will be drained to the bottom.

THE NEW YORK.—*Tidings*, Jan. 14: The New York ledge, located on Katu Hayes hill, just west of and adjoining the Pennsylvania, is now being worked with diligence by Jas. Feeny and Jas. Burke, both old and experienced miners. A 20 ft shaft has been sunk on the ledge and a drift has been run 10 ft to the northeast. The ledge in this is from 7 inches to 1 ft in width, and it is estimated that the rock taken out will go about $55 per load, some experienced miners estimating it at $80 per load. There is about 6 tons of ore taken from the ledge, and about the first of next month this will be crushed. Gold is plainly visible in nearly all the rock taken and many of the small pieces are very rich. The location is an old one, having been bought about 12 years ago for $5, and by a New York man by the name of Hopkins. The necessary work had not been done on this mine for some years past and in consequence thereof it was relocated by Jas. Feeny, and work commenced by the above-named parties with the good results. The ledge of the New York is running parallel with the Pennsylvania, now being operated on by the Menlo Co.

PLACER.

IRON FURNACE.—Grass Valley *Union*, Jan. 14: The iron furnace, near Clipper Gap, remains closed down, owing to the bad condition of the roads preventing the hauling of an adequate supply of charcoal to keep the furnace in blast. It is rumored that the company will, in the future, burn coal under its own direction and not by contract as heretofore. It is also again reported that the establishment of a rolling mill near the furnace is contemplated.

PILE-DRIVER.—Placer *Times*, Jan. 14: The Bear river tunnel company have brought up a pile-driver with a hammer of 500 pounds weight, with which to replace the wing-dam across Bear river just above their new tunnel. The support posts put in by hand would not stand, necessitating the present course being taken. The driver was hauled out from Colfax yesterday.

PLUMAS.

GRANITE BASIN.—Plumas *National*, Jan. 14: There are but few men in the Basin now, except those at work for Mr. Mintzel, but the company are hard at it, and will soon be on a paying basis. They have recently finished a raise from the main tunnel and have a house over the shaft. The raise passed through some very rich rock in going up 75 ft, the vein being 5 ft wide in one place, and the free gold showing plainly in the quartz. They have been waiting for some machinery from below, but have concluded to start the mill as soon as they get a furnace done, to heat water for the batteries. The rock-breaker has been running for a few days, so as to fill up the feed-room, and make more room above. Tro Ward, who is in charge of operations, says he has got all the available space filled up and considerable rock broken in the mine which will have to stay there until room is made at the mill. Sec & Jolly have been building a blacksmith shop and timber house, and now they are ready to commence running their tunnel. They have some good rock, about 175 tons at the mill and a large lot on their dump that they did not get hauled this fall. They have a good property.

SIERRA.

FOREST QUEEN.—Work on the Forest Queen ledge has been commenced. They are sinking on the rich ore streak encountered in the tunnel last summer. This ore lies against the hanging wall, and it is hoped that it will widen out as they go down. The gold and copper mining company, located 1¼ miles south of Bassett's, above Sierra City, have a tunnel in 234 ft, with 150 more to run to the pay-chimney where it is down 100 ft below the surface. Ore prospects, on the croppings, from $3 to $9 per ton. Work has been suspended since last July, but will be resumed next month. D. Hollister, J. Williamson, D. Pride and O. Bigelow are the owners of this promising quartz location. Mr. Gilligan is working the old Forest ground at Rock creek, making good wages.

AMERICAN HILL.—A force of men went over to the American hill mine, last week. The Bald Mountain company have washed up their little dump and commenced upon the large one. Work has been temporarily suspended at the Rising Sun gravel claim, Thompson's ranch, Sierra City.

ADVERSE CLAIM.—The Rainbow quartz company have applied for a patent, and the Mammoth company have filed an adverse claim.

VIRGINIA DRIFT MINE.—Sierra *Tribune*, Jan. 11: While in Howland Flat, recently, L. Cross, who is a heavy owner in the Virginia drift mine, and who has leased the property for 1 year, showed us a gold brick valued at $1,500 which was the result of a few days' washing at that claim. The company, which is composed principally of Howland Flat gentlemen, have expended a large amount of money in developing this property, but unfortunately did not succeed in finding extensive pay gravel, but since leasing it Mr. Cross has been successful in opening up some rich ground, and the indications are encouraging for its continuation. Forty men are employed at present, and an average of 200 carloads of gravel are taken out every 24 hours.

STRUCK GRAVEL.—"Doc." Bowere and A. Van Zant, who have been prospecting at Kimberlain ravine, 3 miles from Alleghany, have, we understand, struck fine-looking gravel.

TO PROSPECT THE GRAND PRIZE MINE.—A company composed of Forest City and Downieville parties will, next spring, start a tunnel on the Grand Prize location, situated 3 miles north of Downieville. In order to tap the gravel channel, they expect to run the tunnel in about 2,000 ft. Some of the owners, who are experienced miners, consider this one of the most valuable new locations in the county.

THE RUBY MINE.—The character of the ground in raise No. 2 of the Ruby mine has changed considerably in the past few days, the bedrock now being soft. From authentic sources we learn that the indications for finding gravel soon are very encouraging. They expect to strike the west rim-rock by running the main tunnel ahead a short distance further.

LUCKY HILL DRIFT MINE.—Preparations are being made by the Lucky Hill mining company at Scales diggings to run a tunnel into the ridge, where it is supposed that a rich channel exists. Lumber for the erection of all necessary buildings is on the ground and the work begun. The company will push operations this winter with rapidity.

TRINITY.

MINING PROSPECTS.—Trinity *Journal*, Jan. 14: The outlook for a good mining season in this section is not now so favorable as it was a few weeks ago, yet there is no reason to think it may not prove fully average, or equal that of the past year. Up to this time we have had more waterfall than a year ago, and chances favor heavy spring rains. While the season will not be the best ever experienced here there is reason to hope that it will prove far from the worst. Miners in the several districts of the county are making the best use of what water they have, although the freezing weather of the past week has considerably diminished the supply.

TUOLUMNE.

JOHN ROYAL.—Tuolumne *Independent*, Jan. 14: Work has been resumed on the John Royal mine, Summit Pass. We are informed the parties are extracting from the vein very good ore, which yields handsomely, and they feel much encouraged with the outlook of the mine. Work has also been rapidly pushed forward on the Never Sweat mine, near Bixel's brewery. A new tunnel has been driven in 90 ft, which taps the vein 50 ft in depth. A strike is looked for soon.

NEVADA.

WASHOE DISTRICT.

OPHIR.—Gold Hill *News*, Jan. 16: On the 2700 level the joint California-east drift has been extended 30 ft and the main south drift 15 ft. In the joint Mexican east drift are cutting out a drain and putting in boxes. On the 2900 in the joint Mexican east drift a drain is being cut out and boxes put in. Are repairing the joint California drifts and winzes on the 2700 level. During the week 193 tons of ore were extracted from the croppings and 84 tons and 1500 lbs. sent to the mills. Assays have not been received from the mill.

SIERRA NEVADA.—On the 2500 level the winze in east crosscut No. 2, has been sunk and timbered 9 ft; east crosscut No. 5, has been extended 9 ft; the main north lateral drift 34 ft, and main north drift No. 2, 14 ft. On the 2700 level the joint Union Con. east winze has been sunk and timbered 8 ft.

CALIFORNIA.—On the 1050 and 1750 levels are still clearing out drifts and winzes connecting with the old Con. Virginia shaft.

OVERMAN.—East crosscut has been extended 45 ft; face in the porphyry lying west of the vein. Sutro tunnel drift has been extended 65 ft; total length from point "A" 601 ft. Forman shaft has been sunk and timbered 15 ft; total depth, 2,335 ft.

UNION CON.—On the 2100 level, the main north lateral drift has been extended 20 ft, and the main south lateral drift 30 ft.

CON. VIRGINIA.—On the 1650 and 1750 levels are still clearing out drifts and winze connecting with the old Con. Virginia shaft.

MEXICAN.—On the 2000 level, in the joint Ophir east rift are cutting out a drain and putting in boxes.

GOULD & CURRY AND BEST & BELCHER SHAFT.—The west crosscut has been advanced 52 ft; total length, 574 ft.

UTAH.—On the 2250 level the hoist is completed, and shall commence putting in the boh at once. On the 2500 level the east drift has been advanced 22 ft.

HALE & NORCROSS.—Lowered the water in the 2400 level winze and from the 2500 level have commenced a crosscut west which has been advanced 20 ft during the week.

CON. IMPERIAL.—The east crosscut on the 2850 level is in 120 ft; ground passed through, porphyry with occasional streaks of quartz.

UNION SHAFT.—Are casing timbers at the 2000 station and repairing the 1600 level drain tunnel.

BOLIVIA DISTRICT.

RICH ORE.—*Silver State*, Jan. 11: News has been received here that C W. Gilbert has struck another body of rich ore in the Linda Jo mine, down near Bollvia district. Two or three years ago he shipped some carloads of ore from this mine to Salt Lake, realizing some $0,000 or $8,000 clear of all expenses from each carload. For some time past, until December last, he had not been at work on the mine, and now, after a few weeks work, he has struck another body of ore, from which we hope he will realize a fortune.

BRISTOL DISTRICT.

MAYFLOWER.—Pioche *Record*, Jan 14: Nothing new in regard to our mines has transpired during the week. The ore in the Mayflower mine is growing fabulously rich as depth is attained. It has been fully established that the high-grade ore in Bristol district lies deep.

Now that the snow has arrived the prospectors are afforded a good opportunity for working their claims high up on the mountains. The snow, in places, has drifted to a depth of 4 ft, thus affording an ample supply of water for the men while working.

CANDELARIA DISTRICT.

NORTHERN BELLE.—Candelaria *True Fissure*, Jan. 14: Being so near the timbers in the main shaft, only 1 man could be employed on a shift since sinking was commenced. The progress, therefore, has been necessarily slow. Only 8 ft have been made during the week, the formation being in hard lime rock. The levels above the adit are producing about the usual quantity of ore. The average daily yield of ore is about 52 tons. Bullion shipments for the week ending Jan. 11th, $15,042.19. Shipments on January account to January 11th, $19,211.24.

MOUNT DIABLO.—The winze from the crosscut from the bottom of winze No 1, on the 3d level, has been sunk to a depth of 54 ft, but shows no change. The east drift from wieze No. 3, on the same level, is in 03 ft and shows small bunches of ore in the face assaying $34 per ton. The east drift on the 3d level has advanced 18 ft and has small bunches of ore that assay very high. The stopes above the drift are looking very well and are yielding ore assaye which reach from $80 to $250. The west drift on this level has advanced 9 ft and shows no change. The winze from the west drift on the 2d level is down 78 ft, and the east drift, on this level, has been driven ahead 13 ft. It is now showing bunches of ore assaying from $60 to $103.

PRINCESS.—The work of excavating the shaft for a double compartment was begun on Monday last. Three 8-hour shifts were put on and everything is being pushed to an early completion. At present a windlass is being used for hoisting, but steam will be used as early as practicable.

LUCKY HILL.—Everything about the mine is progressing with the usual vigor. The pump for the boiler froze up at the beginning of the cold weather, but is all right at this time.

CENTRAL DISTRICT.

THE KEYSTONE MINE.—*Silver State*, Jan. 14: Yesterday a 12-mule team belonging to Alex. Wise left here with tools and provisions for the Keystone mine, in Central district. Mr. Wise recently purchased the interest of R. V. Craig in this mine, and he is now preparing to commence work on it. It is opened by an incline to a depth of 175 ft. At a depth of 100 ft a level has been run a distance of 150 ft on the ledge. The ledge is as well defined and regular as it could be, and will average as far as opened 1 ft in thickness, and the ore averages about $100 to the ton. It is estimated that there is at least 150 tons of ore on the dump that will pay well to ship here and work. Six men will be put to work on the mine next week, and the ore will be shipped to the Winnemucca reduction works.

DOWNEYVILLE DISTRICT.

ORE.—Grantsville *Bonanza*, Jan. 14: Work is progressing steadily in the mines at Downeyville with the most flattering results. The ore encountered is of a high grade and new discoveries are frequent. These mines give promise of developing into one of the finest mining properties in Nevada. M. Raphael informed us on Thursday that the furnace started up on Monday and will run steadily for about 40 days, after which it will be closed down for repairs. It is to be hoped that the run will prove a lucrative one to the owners. The future of Downeyville looks bright, and we trust that it will become and continue a prosperous mining camp.

ESMERALDA DISTRICT.

WORK.—Esmeralda *Herald*, Jan. 14: The Centennial is looking as well as usual. There are a number of claims upon which assessment work is being done that show up good ledges. Everything is looking as usual at the Cortez. An upraise was started about 20 ft from the lower tunnel in the drift connecting the tunnel and incline shaft, and a splendid body of rich ore encountered. In other parts of the mine where work is going on good ore is found.

GRANTSVILLE DISTRICT.

THE CENTENNIAL.—*Bonanza*, Jan 11: Work in the Centennial mine is being pushed vigorously. The indications continue favorable for the encountering of an extensive ore body; in fact, it would not surprise us to hear that a rich ore deposit had been cut into at any moment. Mr John Irvine showed us some ore from this mine on Tuesday that looked very promising, no assays having yet been made.

LEWIS DISTRICT.

EAGLE.—Lewis *Herald*, Jan. 11: The tunnel on the Eagle ledge is being driven ahead night and day. But little change has taken place in the character of the ore since last week. Near the south end of the claim a shaft has been sunk 70 ft, in good ore all the way, and the rock piled up on the dump.

STARR-GROVE.—The south drift on the 185 level still holds its own, and considerable ore is being stoped out above this level.

HIGHLAND CHIEF.—The south drift on the Highland Chief, 100 level, is advancing rapidly. Three shifts of men are also sinking the main incline.

MORNING STAR.—The lower level in the Morning Star is looking as well as ever, and opening up a large body of ore for future stoping.

SUN BEAM.—Messrs. Courter & Keay have a force of men opening up the Sun Beam mine. The ledge is large and of good quality.

BETTY O'NEAL.—The sinking pump not having arrived for the Betty O'Neal mine, sinking has been suspended for the present. The shaft has, however, reached a depth of 20 ft below the tank station. The miners are at work stoping out ore from the upper works, and considerable rich ore is being extracted and piled on the dump.

EVENING STAR.—Work is still progressing on the Evening Star with flattering results.

ESTELLA NEVADA.—Considerable work has been done on the Estella Nevada mine during the fall and winter, and men are still at work on the main tunnel.

MOREY DISTRICT.

WORK.—Belmont *Courier*, Jan. 7: There have been no new developments made in the Morey mines during the week, still things are looking as well as ever, and the usual amount of work is being done. The company shipped 2 bars of bullion on the 28th ult., one of which was stamped 927 fine; the other about the same. This mill is running nicely and doing good work. Superintendent Max. E. Bernheimer, feels confident in the belief that Morey is destined to soon become one of the very best bullion-producing camps in Nye county.

PAHRANAGAT DISTRICT.

VALLEY.—Pioche *Record*, Jan. 14: In the near future the Valley Co., whose headquarters are at Cincinnati, will probably resume work on their property in Pahranagat district. We would like to hear of the old mill at Hiko starting up again. It would give the settlers something else to do besides quarreling with each other.

SANTA FE DISTRICT.

IMPORTANT MINING SALE.—Esmeralda *Herald*, Jan. 14: There was recorded this week in the County Recorder's office a deed from Owen and J. T. Bradley to F. M. and B. O. Smith, of the Tip Top, Oulena, Guardian and Truckee mines, one-half of the Aurora and Juniata mines and one-half of the Tremont springs and mill-site, Comstock springs, Sweetwater springs and the Frisco Belle spring. The Bradleys reserve, 10,050 ft in the Truckee and Guardian mine. The properties are situate in Santa Fe district, near Belleville, Esmeralda county. Smith Bros paid in the neighborhood of $20,000, cash down, for the properties. We congratulate our old friend J. T. Bradley on his good fortune. He certainly deserves what he got, for he has struggled hard for years. He asks us to thank those who helped him to prospect his mines by the loan of money, and wants every man to whom he owes a dollar to step up and receive his coin.

TEMPIUTE DISTRICT.

FAVORABLE.—Pioche *Record*, Jan. 14: There are 4 men working in the mines of Tempiute district, and reports from there say they have very favorable showings. Work may be resumed on some of the patented mines of that district next summer.

COLORADO.

NOTES.—*Register-Call*, Jan. 10: Two and one-half cords of ore from the White Cloud mine, in Russel Mining district, treated under stamps at the Randolph and Cashier mills, last week, yielded 20 ounces and 5 pwts. of gold. Under the superintendency of Dr. Henry Paul, the White Cloud mine is being developed in a systematic manner. The smelting iron produced is above the average grade.

HAZELTINE.—Mr. Mellor, of the Hazeltine Mining Co., has written his company regarding the feasibility of adding 2 5-stamp batteries of the new Bulthoff combination mill, to the concentration works of that company, in Willis gulch. It is expected that the pumping apparatus attached to the Hazeltine mine, partially destroyed by the fire of two weeks ago, will be in running order the first of the coming week. The shaft was not so badly damaged as has been reported.

PRIZE.—Bostwick & Co. are sinking a lift of 100 ft in the Prize working shaft, Nevada district. It has attained a depth of nearly 550 ft, but no material change has yet been encountered. A small amount of tribute work in the upper workings is going on. Beverly & Gilbert are working a force of miners in the east level of the Yellow Jacket lode, on Camp Clifford mountain, and are taking out pay.

RARA AVIS.—The Rara Avis Co. have about 60 ft to drive in the tunnel on the vein of the Whitney mine, to make connection with the air shaft. The vein matter, as the tunnel progresses westward, becomes more mineralized, and is being piled up at the mouth of the tunnel, awaiting the completion of the company's concentration mill. Development in the main working or No. 1 shaft is going forward steadily.

IDAHO.

MAYFLOWER.—Wood River *Times*, Jan. 14: Three weeks ago, in referring to a rumor which prevailed that the Mayflower, Jay Gould and Eureka mines, of Bullion, had been sold to Colorado capitalists for $450,000, the *Times* stated as a reason why the report could not be true, that the mines named were owned by as good judges of such property as were in the United States, and that the ground referred to was worth fully twice the sum named. The *Times* is pleased to inform its readers that its view was correct. Only one mine was sold—the Mayflower, and the price agreed upon is $375,000, of which $100,000 has been paid, $50,000 more is to be paid in 15 days, and the balance in June. The purchaser is a Chicago company of which the leading merchant prince, John V. Farwell, is President, and J. T. Cooper, George Clark, Colonel E. A. Wall, and U. S. Marshal Shaughnessy are Trustees. The two last-named gentlemen were the owners of the Mayflower, and will only remain on the Board until all the purchase money is paid. The mine is being turned over to-day to Supt. O. L. Havens, and B. Manford, John Jackson, H. M. Morris and G. L Harris, five gentlemen who arrived from Leadville, Colorado, by Kelton stage, to take charge of the mine for the new owners. It is not reliably known whether, as at first reported, George D. Roberts is interested in the company; but as J. T. Cooper, the gentleman who engineered the sale, operated for years in Leadville in connection with Mr. Roberts, it is very likely that the latter is interested in the new company.

MONTANA.

RETORT M. & M. CO.—*Inter-Mountain*, Jan. 10: The Retort M. & M. Co. was organized under the laws of Montana, with a capital stock of $1,000,000, divided into 20,000 shares of $5 par value each. The company is principally made up of New York and other Eastern capitalists. The company own the Retort group of mines in Cataract mining district, which are on an extension of the Boulder mine. Mr. George G. Hammer, while in New York city, secured through the agency of J. M. Moore & Co., brokers, the capital necessary for the purpose of driving a deep tunnel between the Boulder and Retort mines, both companies joining in the enterprise. The tunnel will be between 1,200 and 1,400 ft in length, and will tap the main vein at a depth of 500 ft. The tunnel will crosscut at least 7 or 8 distinct veins which appear on the surface, and may also encounter some blind ledges. The work of tunneling will be done by machinery, for which purpose an improved air-compressor, a 30-horse-power boiler, 2 improved Ingereoll Eclipse drills, the necessary piping, etc., in all about 30,000 lbs., will be put in position in a short time. John G. Hammer, the superintendent, and N. B. Ringelling have just completed the survey of the tunnel, and ground is now being broken. This development is in accordance with Prof Clayton's suggestions, who is the consulting mining engineer of the company. It is thought that the veins at a depth below water level will carry silver in paying quantities. So far the Boulder Co. have only worked for free gold in the ore. It is estimated 9 months from the time work begins will be sufficient for the completion of the tunnel.

PHILLIPSBURG.—*New Northwest*, Jan. 11: Mining matters in the Flint Creek district continue improvingly onward. Recent developments in the Salmon have exposed in the lowest workings of the No. 2 shaft a large body of very high grade ore, the output per day being from 12 to 15 tons. At the Algonquin the pumps are holding the water to the sump. Nothing new to report of the lower levels. Output of ore about as usual.

AT THE TROUT.—The present depth of the main shaft is 570 ft vertical, the last 100 ft being carried down in the compartments.

THE HOPE mine produces all the mill demands, 15 tons daily. Any amount of good rock on hand. The tunnel to tap the mine from the gulch below is within 20 ft of the vein.

THE GRANITE MINE.—It has more ore in sight, and of better average quality, than can be found in any mine elsewhere in the West.

BELL SMELTER.—*Inter-Mountain*, Jan. 9: At 1 o'clock on Saturday afternoon the Bell Smelter, which has been in process of construction for several months past, was fired up. Not a hitch in any part of the works occurred. Admirable judgement had been used and not a moment's delay was necessary. For the first 12 hours 23 tons of ore were reduced, and for the succeeding 12 hours, 28 tons were put through. At present only one stack is in operation. The matte runs very freely, and is tapped about every eight minutes. It assays 60% copper, and high up in silver.

SALROP PLACER MINE AND FLUME.—Helena *Independent*, Jan. 11: The entire interest of the estate of David P. Fletcher in the Fletcher & Reilly placer mine and bed-rock flume in Nelson gulch, with ditch and water right, being the undivided one third of the entire property, was sold yesterday at administrator's sale to Thomas D. Reilly for $2,900. This is one of the pioneer fluming enterprises of the county, and there are yet many years of profitable work before them.

NEW MEXICO.

SALE OF A VALUABLE MINE.—Bernalillo *News*, Jan. 11: What was threatened to be a prolonged litigation has been transformed by good sense into an ordinary business transaction. The mine held by Robt. Cameron, and claimed by E. C. Chapin to have been jumped by him, has been purchased of Robt. Cameron by Messrs. Chapin, Wright and others.

OREGON.

PIPING.—Jacksonville *Times*, Jan. 13: W. Ludington has charge of Hays & Magruder's mines on Rogue river and is busy piping, having plenty of water.

RAIN.—Much more rain has fallen in the northern portion of the county than in this, and the miners there are all busily at work.

SNOW.—Considerable snow has fallen in the mountains and there is some probability that this will prolong the mining season somewhat.

JOHN HALL has assumed the management of Bybee, Newman & Hawkett's mine, near Waldo. There seems to be some misunderstanding between the partners.

QUARTZ.—Report reaches us, and it seems to be well authenticated, that Green Bros., of Calico creek, are now taking out quartz that will pay $1,000 a ton. We hope it is true.

WATER.—A. W. Presley, of Jump-off Joe precinct, Josephine county, is in town, who informs us that the miners of that section have an abundance of water and are busy.

GALICE.—Frank Eonis and V. Cook returned from Galice creek last Monday. The former informs us that plenty of rain has fallen in that section and the miners are all at work there with full heads of water.

WILLOW SPRINGS.—W. H. Benner, of the Centennial mine in Willow Springs district, informs us that some piping has already been done there and that more ground has already been washed than there was up to this time last year. Mr. Briggs has completed the survey of a water ditch on Wolf creek, which extends from Henry Smith's down Wolf and Grave creeks for some 8 or 10 miles, and will supply water for a large amount of good paying ground. Mr. Morse, the agent of the company hopes to have the ditch finished at an early day, when that place will greatly increase in mining population.

BRUSHY GULCH.—John Lewman and Wm. Farrie are working their quartz ledge on Brushy gulch, in the vicinity of Applegate, with promising results. They have sunk down over 20 ft and their ledge is about a foot wide, with an abundance of good quartz in sight. Gold can easily be seen in the ore with the naked eye, and the owners are now engaged in grinding some of it.

UTAH.

THE MUSCATUN CROUP.—Salt Lake *Tribune*, Jan. 14: These mines are being worked again, this time by Flaull & Co.

THE GREAT BASIN.—The main incline is being sunk down through the pyrites, under contract with the expectation of finding rich ore below.

THE JASPER AND CRANGER.—The work recently done on these properties under the direction of S. D. Davie shows indications of another large ore body.

THE QUEEN OF THE HILLS.—The prids of the old Chicago Co., now owned by the Flavilla M. Co. has resumed shipments under lease to S. D. Davie

THE AGENT.—A good mine owned by the Norris S. M. Co. has become involved by bad and inexperienced management and is advertised for sale on Jan. 23d by the U. S. Marshal.

BULL VALLEY MINES.—Silver Reef *Miner*, Jan. 9: Gen. Pace has a force of men working on his mines in Bull Valley district, some of which are looking very well. Samples recently sent to St. George gave very promising results in silver. Ten miles north in Damon valley, two parties are at work sinking shafts upon recent locations. It will be remembered that about a year ago parties prospecting in the localities named found traces of old smelting works, which conforms to the report that more than a century ago the Spaniards, in their northern explorations, discovered mineral there, and erected reduction works, which they as far as possible obliterated when they passed on. Traces of previous mining have also been found in these localities.

THE HORN SILVER CO. has a large force of men employed in the mine. They are determined to outstrip the record of the previous year three-fold. Their smelters at Franklyn and Frisco are all in prime order and dividends of magnitude will be forthcoming.

LULU.—Work on the Lulu is still progressing. The formation, so far, has changed but little. This company started to sink, and sink they will, several hundred ft, if necessary, before crosscutting.

MILL.—We learn the mill now in course of erection on the Copper Belt mine, at Marysvale, is about completed, and a successful run on the ores from the famous Deer Trail and Copper Belt mine is anticipated. Much credit is due Messrs. Lovett and McCorkindale for their enterprise in pushing the pioneer mill of that promising district.

BEAVER LAKE.—The O. K. copper mine in Beaver Lake mining district, is down on the footwall a little over 30 ft on a very fine quality of ore. At a depth of 75 ft a crosscut at right angles through the vein has been run about 60 ft on ore.

THE Foreman shaft is down 2,328 feet and is being sunk and timbered at the rate of 10 feet per week. The drift to connect with the Sutro tunnel is in 660 feet from a point 200 feet west of the shaft. Connection will be made early next month.

The Public Lands.

How to Make Known Our Vacant Lands.

Hon. B. B. Redding has in the January *Californian* a very valuable article on "Immigration, and How to Promots It." It is a straightforward letter of advics from one who has had almost a score of years' experience in public land matters in this State, as to the way to give practical aid to new comers who are in search of lands for homes. We are obliged to content onrselves with extracts from the article, having chosen them with an idea of showing our readers the steps which are necessary to take to find out what land is still open for settlement in any part of the State which they may wish to examine. We qnote from the *Californian* as follows:

The man who comes to find a piece of public land for a farm, that he can pre-empt or homestead, wants definite information. He wants to know where he can find, at first cost, a piece of land of 80 or 160 acres, npon which he can raise wheat, grapes, or other crops, and thereby support himself and family. Any bureau of immigration that fails to furnish this information has no reason for living; is not worthy of support, and should die. It is popularly supposed that this kind of information can be obtained at the United States or State land offices. This is only true in a general sense. The basis of the information is to be found there; but it is distributed through perhaps 50 volumes of 400 pages each; and the United States does not find clerks to collate and classify this information. It surveys the land, furnishes a record of the quality of so much of it as is passed over by the surveyor—whether level, timbered or rocky—and opens thee books to public inspection, and says, *caveat emptor*. If the immigrant goes to the land office, and says he desires to pre-empt a piece of land, the clerk immediately answers, where? It is not the clerk's business to find him the land, or to direct him to land he, the clerk, has never seen. The clerk will show him the books and maps, and allow him to make a selection; but, unless more than ordinarily intelligent, can only answer generally as to the climate, rainfall, or productions of the region in which the immigrant proposes to make a selection. If California was similar to Kansas and Nebraska, with thousands of square miles of prairie of almost uniform character and climate, the clerk could hardly direct the immigrant amiss; but California is peculiar. Generally, the most valuable agricultural portion of it may be described as a series of large valleys, running northwest and southeast, between two ranges of mountains. Some places at the north end receive nearly 100 inches of rain annually; other places in the same valley, not to exceed five inches. There is also a great difference in the rainfall between the east and west sides of the valleys, at the same elevation. There are also local differences; as for illustration: There are vacant Government lands in the San Francisco land district, in township four south, of ranges three and five east. If the immigrant selected his pre-emption in four south, three east, his land would receive an annual average of 18 inches of rain. If he selected it 15 miles farther east, in four south, and five east, his farm would receive not to exceed eight inches, and his crops of wheat would be failures four years out of five. He would find, by practical experience, that the Mt. Diablo range of hills, lying west of his farm, stripped the moisture from the clouds before they passed over his land. It is not the business of the clerks in the Government land offices to devote their evenings to the study of the meteorology of the State; nor to expend their salaries of $100 a month in examining lands, and estimating their agricultural possibilities, for the benefit of immigrants or the public. This is the work of the State, through a geological survey; and is not, in new States, usually undertaken and completed until public schools and universities have not only been planted, but have grown and borne fruit.

All the information necessary for the immigrant or settler can be procured, and can be exhibited to him, with such certainty and clearness, that, if he has positive ideas as to the kind of agriculture in which he proposes to engage, he can be directed to particular townships, containing public lands from which to make his selection. The business of obtaining and collating this class of information is in the hands of men who, from natural aptitude and opportunity, have been compelled to make the subject a study. A very excellent clerk or book-keeper might make a very poor searcher of records.

The gathering and publication of this information, as the only practical means of promoting a healthy immigration of agriculturists, should be under the direction of a bureau created by the State. This bureau should act under authority of law, not because the State, as a rule, does work as well or as economically as individuals, but because what is published by the State goes out as official, and has a weight and unquestioned influence in the countries from whence our immigrants come that are not accorded to the publications of individuals or corporations.

To direct and aid this class of immigrants, the Board of Trade of San Francisco has appointed a committee of gentlemen, who, without doubt, are unselfish, sincere, and earnest. It is very desirable that the work of this committee should result in fruition. Many of the members have possibly no more than a general knowledge of the laws of the United States and the rules and regulations of the United States Land Department, governing the survey and disposal of the public lands. It is not therefore, improper to show plainly what is necessary or requisite before this or any other committee or bureau could do effective and practical work in directing the farming immigrant where he may find desirable public land on which to make a home. It may also be added, that the system here proposed is not theoretical, but founded upon practical experience during the past 18 years.

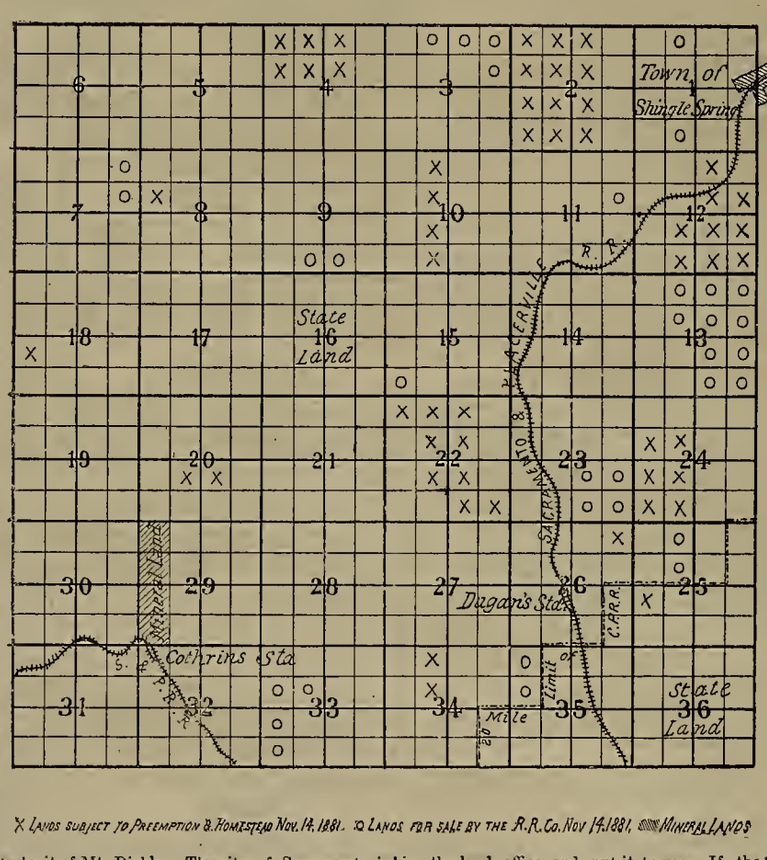
The public lands of the United States are first surveyed into blocks six miles square; these are called townships. These townships are numbered north, south, east, and west, from some prominent central point. In the northern part of the State this point is the summit of Mt. Diablo. The city of Sacramento is in township eight north, of range four east, therefore, it is in that particular township which is 48 miles north, and 24 miles east, of Mt. Diablo. These townships are subdivided into 36 sections, each a mile square, and systematically numbered. Each section again into quarter-sections of 160 acres each; and theoretically, these again into 40-acre tracts, which is practically the smallest subdivision with which the Government deals. This system is definite, and avoids any confusion. It enables tho intending settler to find a given piece of land, and assures positiveness and clearness of description in patents and deeds. A conveyance of the southeast quarter of the northeast quarter of section 17, township 10 north, of range eight east, Mt. Diablo base and meridian, gives a clear and positive description of a certain and particular 40 acres of the earth's surface, which cannot be made to apply to any other 40 acres on this planet.

When a township is surveyed and subdivided, a map of it is made, and filed in the local United States land office. Any settler who may be living on the land in this township has now the preferred right, for 90 days, to file, in this land office, his claims of pre-emption or homestead for 160 acres, which must embrace the land where his house and other improvements are situated. The cost of filing a pre-emption claim is $3. The Government requires the settler to occupy and improve the land, and gives him a credit of two years and nine months within which to make his payment. He should, before the expiration of this period, appear at the land office, with two witnesses, and prove to the officers that he has lived on and cultivated the land, when he is allowed to pay for it, at the rate of $1.25 per acre, if outside of the limits of the grant of odd-numbered sections made by the Government to aid in building a railroad; or $2.50 cents per acre, if within those limits. After this is done, the Government issues to him a patent for the land. If the settler so elects, he may file a homestead for 160 acres. The fees in this case, if without the limits of a grant to a railroad company, are $16; or $22, if within such limits. The settler in this case is required to reside upon and cultivate the land for at least five years, after which he can appear, at any time within two years thereafter, with two witnesses, before the land office, and prove the facts of his residence and cultivation, when the United States Government will give him a patent without further cost, except an additional fee of $6, if the land is beyond railroad limits; or $12, if within such limits. There are other means of obtaining lands from the Government, such as State selections, university locations, etc.; but these do not interest the immigrant bureau, or the intending settler.

All of the land in the township not thus appropriated by the settlers who were living upon it at the time of the survey is subject to pre-emption and homestead, in 160 acre tracts, by the first settler who will occupy it, file upon it in the land office, and put it to use. If the township is within the limits of a grant to a railroad company, then only the vacant quarter-sections of even numbered sections are thus subject to pre-emption and homestead. The odd numbered sections can only be obtained by purchase from the railroad company.

The practical business of a bureau of committee on immigration is: First, to obtain the information where, in this State, may be found public land of the Government, of average quality, that is subject to pre-emption and homestead. Second, to have this information put upon maps, and kept in charge of an intelligent clerk, who has a sufficient knowledge of the State, its climate, and productions, to enable him to explain to an immigrant how it may be found and examined; and generally, the productions, climate, rainfall, and market facilities of each particular region. Third, the publication and distribution of a pamphlet, giving the obtainable statistics of the productions of the State, and its exports; the character of country; its peculiarities of climate; its rivers and railroad system; its common school system; and generally, such other facts as would give a stranger a correct view of California and its people. The publication should also state that there remained, of public lands, on the day of the publication of the pamphlet, as many millions of acres as may be found; that these lands are unappropriated, and are subject to pre-emption and homestead, in tracts of 160 acres, by any immigrant who desires them. It should further state that the immigrant bureau will have on exhibition maps showing these lands, and a person in daily attendance to explain to the immigrant how they may be found; and further, that no fee will be charged for giving this information. If possible, the correctness of the facts stated in the pamphlet should be indorsed by the British, German, Swedish, Norwegian, and other Consuls, as well as by the Governor of the State. If these three things were done, in a very short time the question of immigration would be solved. We need but show the members of the dissatisfied classes of the East and Europe where they can obtain fair lands, at Government prices, or practically without cost, and they will find the way to come and take them.

If the bureau obtains this information, and simply gives public notice that it will, without cost, direct agricultural immigrants where they may find public land suitable for cultivation, and supply skeleton maps, showing these lands in a given township in detail, it may, in my opinion, cease further work or expenditure. The various transportation companies will, in their own interest, take the necessary measures to bring people to the State. To illustrate how simply and easily this information can be gathered by the bureau, and with what clearness and directness it can be exhibited to the immigrant, I have selected a township at random—township 9 north, of range 9 east, Mt. Diablo base and meridian; that is, that township which is 54 miles north and 54 miles east of Mt. Diablo. A map of the State shows it to be in the Sacramento United States land district, a part within and a part without the limits of the grant to the Central Pacific Railroad company; and that all of it is in the "foothills" of the Sierra, and within the county of El Dorado. The State map also shows that the Sacramento and Placerville railroad passes through it. A letter to the land office at Sacramento, asking what lands had been filed on by settlers, or disposed of by the United States in this township, and an inquiry at the railroad land office as to the patented and unsold lands belonging to the company in the same township, were both promptly answered. From these answers, the accompanying map has been constructed, showing all of the land in this township subject to homestead and pre-emption on the 14th of November, 1881; and also showing the lands which the railroad company, in the same township, had for sale on the same day.



Township No. 9 North
Range No. 9 East Mt Diablo Meridian.

Dugan's Sta
Limit of 6 Mile
State Land
X Lands subject to Preemption & Homestead Nov. 14, 1881. O Lands for sale by the R.R. Co. Nov 14, 1881. Mineral Lands

This map shows that there are, to-day, in this township 2,120 acres of United States land undisposed of, and subject to pre-emption and homestead; and also, 1,320 acres belonging to the railroad company and for sale. To ascertain the general quality of this land, the office of the U. S. Surveyor-General was visited, and from the field notes of the United States deputy surveyor I made the following extract:

"The land in this township is generally hilly; it is intersected by several streams, toward the heads of which are fertile valleys. There are several vineyards in different parts of the township, which produce a good quality of wine. Toward the northern part are hills, destitute of timber and covered with chemisal and manzanita brush, which are capable of being converted into good vineyards. This township formerly contained rich deposits of gold; and the numerous creeks and ravines have been thoroughly mined. At present, there are, with few exceptions, no mines which are remunerative to white labor. Copper has been sought after in different parts of this township, but with no encouraging results. The Boston Copper M. Co. has worked for three years, and has sunk several shafts in the center of the township, but without much success. In the southwest quarter of section eight, and northwest quarter of section seventeen, are limekilns and marble quarries, from which a good quality of lime and marble are procured. The timber is generally white and live oak, and pine, with undergrowth of chaparal, chemisal, livecak, manzanita, and huckeye. The township is well watered, and has good facilities for communication afforded by the different toll roads and the Sacramento and Placerville railroad."

The survey of the Sacramento and Placerville railroad shows that the land in this township has an elevation above the sea of an average of nine hundred feet. The lowest portion of the township, over which the railroad passes, is 453 ft.; and the highest, 1,425 ft. It is, therefore, within what is known as the warm belt of the "foothills." The meteorological records kept by the Central Pacific railroad company show that for the past seven years this township has received an annual average rainfall of 32.61 inches.

With a copy of this map, and the information here detailed, an immigrant could have no trouble in visiting this township, and making an examination of the vacant lands. He would, without doubt, find many tracts within the inclosure of people who, having exhausted their own free pre-emption and homestead rights, are desirous of retaining the use of adjoining valuable public land as long as possible; but they will generally yield possession when a filing is made in the United States land office.

From personal knowledge and cursory examination of the records, I am convinced there are, on the plains east of the Sacramento and San Joaquin rivers, and in the "foothills" of the Sierra, below an elevation of 2,000 ft., more than 2,000,000 acres of wheat, orchard and vineyard land subject to pre-emption and homestead.

In taking this township to use for the purpose of illustrating how the vacant lands are to be found and exhibited to the immigrant, I happened upon one quite thickly settled, where there are schools and places of worship, wheat farms, orchards and vineyards—in fact, one of the most noted vineyards in the State is in this township. If I had taken, for purpose of illustration, a township farther away from a railroad, it would have disclosed larger bodies of public land.

The Engineer.

Engineering Progress for 1881.

It is well at the threshold of a new year to look back at the achievements of labor, discovery, invention and the like, and make note of that which will give to the year its historic character. We condense from the *Scientific American* a brief reference to the progress which has been made during the past year in the matter of engineering, from which it appears, that although it has not been the best of years, 1881 will not go down to history as an empty or a bad one.

In New York, the lighting of streets and squares by electric lamps was begun less than a year ago. The work of putting down mains for the conveyance of electric conductors for a general system of incandescent electric lighting for stores, offices and dwellings is going on rapidly. And the same may be said of mains for steam heating from central stations.

The great bridge across the East river is nearing completion. The year has seen the approaches substantially finished and work on the superstructure begun. The original plans have been materially changed during the year, making the bridge five feet wider and four feet higher, with greatly increased strength, to enable it to carry railway trains of Pullman cars.

The tunnel under the Hudson is progressing rapidly and securely by improved methods, work going on from both shores. Steady progress is also making in the excavations under Hell Gate for the removal of Flood rock.

In marine engineering the most notable progress has been seen in the building of steamships exceeding 5,000 tons and up to 8,000 tons, and in the substitution of steel for iron, as in the construction of the *Servia*. On the destructive side we have seen the successful testing of the Ericsson torpedo boat, *Destroyer*, the less successful testing of the *Alarm*, and the launching of some notable torpedo boats in England.

Besides the work of civil engineering already noticed are several more or less important ones, begun or completed, which should not be forgotten. Another line of railway communication across the great West has been completed in the Southern Pacific road, and rapid progress has been made toward the completion of the Northern Pacific.

Our southern neighbor, Mexico, has manifested unwonted activity in railway extension, and unwonted wisdom in greeting cordially American enterprise therein, and in the Tehuantepec ship railway scheme of Capt. Eads. At Panama, the De Lesseps canal project has been seriously begun; surveys and some excavations have been made, and a small army of laborers employed. The St. Gothard tunnel, through the Alps, has been opened to traffic, and the projectors of the English channel tunnel have given earnest of their sincerity in steady and promising work in actual drifting under the sea.

Not the least notable characteristic feature of the year has been the increasing attention given to useful applications of electricity, due partly to rapid advances in electric lighting, but more, perhaps, to the prominence given to electrical affairs by the successful exhibition at Paris. The storage of electricity, so-called, though not new, has been greatly developed and improved during the year. From being a laboratory experiment known to few, it has risen to be a promising factor in the practical application of electricity to every-day affairs. The electric railway has been extensively tested on the continent, and ground has been broken for a commercial electric railway in Ireland. The system of telephonic stations for civic purposes begun in Chicago, has been much extended, adding materially to the efficiency of the police system.

The Fast Steamer Line.—It is stated that all the needed capital has been raised for Mr. Jacob Lorillard's proposed express passenger line of steamers between New York and England, by which it is intended to make the trip from port to port in six days, thus effecting an important saving of time over the present ocean voyages. By this line the ships will not come into New York harbor, but will land on the extreme eastern end of Long Island, where there is a deep natural harbor. The Long Island railroad will be extended to this point, which is about 100 miles from New York, and passengers will be saved the long and tedious voyage past Long Island and through the Narrows up to the city. The harbor on the eastern side will be Milford Haven, whence quick transit to London will be given by rail. The vessels to be built for the new line are to cost between $1,500,000 and $2,000,000 each, or some 50% more, it is said, than any vessel heretofore launched, and as it is intended to make the line purely American, they will probably be built on the Delaware. When the voyage from America to Great Britain can be made in six days, instead of requiring from ten to fourteen, as now, travel to and from Europe will vastly increase.

Light from Wave Power.—An iron buoy, fitted with apparatus, intended to convert the power of wave motion into electricity, which will, in turn, supply an electric light, has been anchored in the lower bay outside of New York harbor.

A large number of new mines will be opened up the coming spring to swell Utah's mineral production.

Useful Information.

To Design a Monogram.

Scarcely anything seems so easy as to design a monogram, yet we see very few successful ones, the most of them being a mass of mixed-up letters and ornament of which we can find neither the beginning nor the end. There is a law regulating the designing of everything, and it is this law which the true designer keeps in mind and applies to his work; the effects of obedience to this law and its violation are seen as clearly in the design for a monogram as in the design for a cathedral.

First, there should be harmony of composition—that is, the letters should so emphasize, subdue, or control each other that the composition should impress us as compact, appropriate, and, being so, beautiful.

Second, there should be no unnecessary ornamentation; there should be a quiet and peace about the design which will always please the truly artistic. Looking at some designs, we get the impression that ornament was so plentiful that the designer saw no other means of consumption than that of burying his designs in it, for we see that there is a mass of curves, angles, shades and leaves, but nothing else.

Third, simplicity of lettering is an important requisite, as there should be no possibility of mistaking an E for a G or C, and the boundaries or outlines of the letters should be well defined.

Fourth, the order of sequence of the letters should be carefully attended to.

The common idea is, that a certain number of letters are given with which to make a pleasing design, and so far, that impression is right; but there is something beyond this. There is the art of so placing the letters that one can distinguish at a glance the first, the central and the last letter. Now the rule to be observed to secure this result is as follows: The *last* letter of the monogram must be the principal feature, and must be the largest, the boldest and the heaviest letter; then the *first* letter must be the next in size, but the lightest in outline and color; then the *central* letter must be the smallest and of an intermediate tint. If the monogram is of four letters, the two intermediate must be the same size and the second letter lighter in outline and color than the third.—*Art Amateur.*

Cleaning Brass.—The government receipt for cleaning brass, used in the arsenals, is said to be as follows: Make a mixture of one part common nitric acid and one-half part sulphuric acid in a stone jar; then place ready a pail of fresh water and a box of sawdust. Dip the articles to be cleaned in the acid, then remove them into the water, after which rub them with sawdust. This immediately changes them to a brilliant color. If the brass is greasy, it must be first dipped in a strong solution of potash and soda in warm water; this cuts the grease so that the acid has power to act. The *Manufacturer* says that rusted steel can be cleaned by washing with a solution of half an ounce of cyanide of potassium in two ounces of water, and then brushing with a paste composed of half an ounce of cyanide of potassium, half an ounce of castile soap, an ounce of whiting and sufficient water to make the paste.

To make quickly-drying polish or varnish to be applied to small turned articles while in the lathe, with a hard and glossy surface, dissolve ten ounces of shellac in one gallon of wine spirit by gently heating over a water bath and stirring. Let it stand for several days in a covered vessel, then draw off the clear portion from any sediment, for use. For ebonizing articles of this kind, put the wood for about half an hour into a hot solution of one ounce of logwood extract in a quart of water, and then transfer to a warm solution of one pound of copperas in a gallon of soft water, and let it remain in this bath for several hours. Give the pieces a second dip in the logwood and iron liquors, then rinse and dry.

To Make a Good Cologne.—Take alcohol 95%, 1 quart; oil of cedrat, 9 drams; oil of thyme, 2 drams; oils of bergamot and lemon, 6 drams; oil of Portugal, 4 drams; oils of neroli, vervain and rosemary, 2 drams; oil of mint, 2½ drams; eau de melisse, 2 drams; tincture of musk, 24 drops. Mix, and after standing 24 hours, filter till clear.

Removal of Strong Odors.—It is said that ground mustard is an excellent agent for cleansing the hands after handling odorous substances, such as cod-liver oil, musk, valerianic acid and its salts. Scale pans and vessels of various kinds, may also be readily freed from odor by the same substance.

Sheet zinc is largely used for ceilings in Germany, especially where the beams of the upper floor are made of iron. The use of wood is entirely dispensed with, and excellent decorative effects are produced by stamping, painting and gilding, or bronzing a part of the ornaments.

Improving the Mississippi.—The Mississippi valley members of Congress will meet soon to consider the improvement of the Mississippi. They say that they are determined to have an appropriation this season, and are all in accord.

The Match Business.

It may not be generally known, yet it is nevertheless a fact, that a monopoly exists in the match-making business at the East as fully equipped and as well organized as that of the Standard Oil Company. There may be more money invested and larger profits growing out of the latter, but the monopoly of the former is not less perfectly organized.

The head office of this mammoth match-making concern is in New Haven, Conn., and it is said to have but a single important opposition—a factory at Trenton, N. J. The company has 15 factories in operation, scattered throughout the Eastern, Middle and Western States. It is well supplied with the most perfect labor-saving machinery, by which it is enabled to perform its vast labor by the aid of only about 3,000 hands in all its factories.

In one room in one of the two factories at St. Louis there is $12,000 worth of machinery used for the making of paper boxes. The whole process is mechanical. At Akron, O., where probably the largest factory is located, the machinery is so perfected that one might say a tree is put in one end of a machine and it comes out matches at the other. The company has about $5,000,000 invested in machinery and buildings.

What is the annual yield of matches?

It would be difficult to estimate it. Some idea may be gained by a glance at the figure paid for stamps. The Government exacts a revenue of one cent per 100 on matches manufactured. During the year ending May, 1881, the company paid for stamps, $4,500,000. This year the amount paid will be increased $50,000. You may figure it out yourself. There are 200 matches in a box. The tax is two cents; they are sold to the grocer for three cents, and retailed at five cents.

Figuring upon this basis, $4,500,000 represents that 455,000,000 one-cent stamps were used during the year, and as each stamp represented 100 matches, the grand total manufactured is 45,500,000,000 matches, or 277,500,000 5-cent boxes. This would give 910 matches per annum, for every man, woman and child in the country, and an expense of 22¾ cents for each.

A New Coloring Matter.—A Vienna chemist has succeeded in producing a new coloring matter on silk, which is a nice blue by day and a beautiful pink by artificial light. The alcoholic solution of this color is dark violet in a refracted, but red in a direct light.

Good Health.

Beef Tea not Wholesome Food.

Beef tea has long held a high reputation as an article of diet for the sick, but this reputation stands on a false basis, and is likely some day, if not soon, to fall. It has already received several blows, but none so hard as that given by G. F. Masterman, in a recent number of the London *Lancet*. This gentleman draws attention to the fact that in its chemical analysis it is very analogous to urine, except that it contains less uric acid and ures. No matter how carefully made, it contains only from one and a half to two and a quarter per cent. of solid matter, which is made up mainly of urea, kreatine, kreatinine, isaline and decomposed hæmistin—all of which are to be found in urine.

This is not the only author who has tried to impress the public with the fact that beef tea is a stimulant and not nutritious, and composed mainly of excrementitious matter. All this, however, has been of little avail, for we constantly find medical men and non-medical ones who still believe in its virtues, and if told that milk, or wheat meal and barley gruel, rightly prepared, are many times as nourishing, they look at you with a very skeptical stare. How often do we find the sick one starving with an endless supply of wines, jellies, essences of meat and beef tea in abundance, and orders to administer some of them every half hour. In a majority of such cases all this beautiful but worthless trash should be cleaned out at once and milk and gruels substituted.

There is one disease in which beef tea will prove specially injurious, and that is Bright's disease, for a person suffering from it should take no food which is likely to so greatly increase the very elements in the blood which the kidneys cannot eliminate. Dr. Neale states that in diarrhœa, dysentery and typhoid fever he has become convinced that this fluid is a poison. Dr. Brunton, of England, mentions the fact that mental depression and nervous diseases are made worse by it, and says: "We find only too frequently that both doctor and patient thinks the strength is sure to be kept up if a sufficient quantity of beef tea can only be got down, but this observation raises the question whether it may not frequently be injurious, and whether the products of muscular waste, which constitute the chief portion of beef tea and beef essence, may not be actually poisonous?"

It may be asked: "If beef tea is so similar in composition to an important excretion of the body, why should not the latter produce a similar effect?" To which it may be replied, that the effect produced by the two substances is very similar. In South America, urine is a common vehicle for medicine. The same substance has been highly extolled for small-pox. Among the Chinese and Malays it is freely used for the sick, and often apparently surpasses European remedies in its value. A traveler there says he has often seen it taken as freely and with the same gusto as beef tea is by the Europeans. We might illustrate this point by further facts, but it is not necessary.

It may again be asked, what do you give us that is better? The answer is, milk, oatmeal, wheatmeal, barley and cornmeal gruels. These latter, well made, are really valuable and not poisonous. Let beef tea, then, be dropped. No matter if it be elegantly made from Liebig's, or other extracts, it is, all the same, a worthless food and a poison, which may injure the one who takes it.—*Herald of Health.*

How Our Busy Young Men Destroy Their Health.

There was an inquest held the other day on the body of a city clerk which is instructive, in that it shows the madness of the railway speed at which too many live, and points to a new disease that completely baffles modern medical science. The disease, with its innumerable affiliated branches, is commonly and inaccurately known as "overwork." It should, with more direct truth, be called the nineteenth century malady of fuss and flutter, and the almost inourable fault of forgetting to live. Overwork does not, as a rule, kill any man; in fact, more men die from sheer idleness than from steady application; but what does kill men is the anxiety to get a good start and keep the lead, the nervous strain of pressing forward in the race of life, the extreme tension of the vital power caused by worry and increased by noise, locomotion, restlessness, harshness and the occasional cruelty of the world. This city clerk was simply an exhausted machine. Not yet in the prime of life, he paid the penalty of high-pressure at the early age of 36. He worked his brains and he worked his hands, he neglected sleep and nourishment as well, he was forever exhausting the system and never supplying the deficit, and at last, without any apparent warning, nature closed the account, and the career of the city clerk was over.—*Herald of Health.*

Warm Bed Clothing for Children.—It is fully as important that children should be warmly clad at night as during the day. Nor is it sufficient that the bed-clothing should be warm. Indeed, we are apt to err in using too many blankets rather than too few. Then the restless child kicks off the cover, and from a warm perspiration becomes chilled through, and a severe cold is the consequence. Delicate children should sleep in flannel, while for more robust constitutions Canton flannel in the lighter grades is heavy enough. Night-drawers are to be preferred to night-gowns, and the legs of the drawers should be long enough to reach the feet. Indeed, the style which covers the foot also, like a stocking, is an excellent one for children who are restless sleepers. Night-gowns for babies should be long enough to come down well over the feet, and flannels should be worn in cold weather, the pinning blankets which are furnished with all layettes. In every household where there is a baby, there should be at least one open fire where its feet may be occasionally toasted. No one can sleep healthily when cold, and the baby will rest much better if laid to sleep upon a warm blanket than between cold sheets.

Prescribing by Telephone.—A few evenings ago a physician of North Adams, Massachusetts, was called by telephone about one o'clock at night. The call came from Briggsville, about two miles away. A child was there suffering with the croup and in a critical condition. The night was dark and stormy, and the doctor found nothing pleasant in the contemplation of the trip which he was asked to make. When preparing to go out into the darkness and rain, his mind conceived a bright thought, which was immediately followed by acts. He called the Briggsville house in which the little sufferer lay, and requested the parents to bring it to the telephone transmitter. This was done. The child coughed its croupy cough, and the doctor listened intently to every sound which came from his patient. He prescribed a remedy, and one of the members of the family prepared and administered it. The relief was immediate and the recovery rapid. The doctor waited at the telephone until he heard of the favorable results of his prescription, and then sought again the repose of his couch, pronouncing blessings on the inventor of telephones.—*Hartford Post.*

A Hard Struggle.—There are many men who kill themselves in their attempts to keep themselves alive. They work because they must eat. With their tasks come worry, overwork, death. In these days it is difficult to live—that is, for some men. They are handicapped in their struggle. A portion of society has become possessed of the wealth that should be in the hands of their fellows. A glance around forces home to one's mind with power the fact that the man who has knowledge of himself—who knows how to maintain health of body, mind and morals, possesses a great advantage over other men in the struggle for life.

The Oregon Railroad and Navigation Co. have commenced with 600 men grading between East Portland and the Cascades. On account of the frequent rains progress will necessarily be slow.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Process of Treating Copper Ores; Miners' Wages; Academy of Sciences, 33. Passing Events; Our Annual Review; Engineering Improvements Wanted; Bullion Product of 1881; Drif Mining; Slides in the Rivers, 40. Improved Circular Saw Mill; Technical Educatiou; Prevention of Mine Accidents; Machine not "Locatable;" Con. Virginia Mine; 41. Notices of Recent Patents, 44.

ILLUSTRATIONS.—Du Motay's Apparatus for Treating Ores, 33. The Plantation Circular Saw Mill, 41.

MECHANICAL PROGRESS.—American Manganese Ores; Belting Facts and Figures; Malleable Iron, Etc.; For the Preservation of Belts; Water in Steam, 35.

SCIENTIFIC PROGRESS.—Wind Pressures; Uses of Chloride of Magnesium; Parabolic Reflecting Surfaces, The Penetrating Power of Light in Water; Tracing the Storms; Effect of Colored Glass on Liquids; Separate Sounds on One Wire, 35.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board; Notices of Assessments, Meetings and Dividends, 37.

MINING SUMMARY from the various counties of California, Nevada, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, 37-38.

THE PUBLIC LANDS.—How to Make Known Our Vacant Lands, 38.

THE ENGINEER.—Engineering Progress for 1881; The Fast Steamer Line, 39.

USEFUL INFORMATION.—To Design a Monogram; Cleaning Brass; The Match Business, 39.

GOOD HEALTH.—Beef Tea not Wholesome Food; How Our Busy Young Men Destroy Their Health; Warm Bed Clothing for Children; Prescribing by Telephone; A Hard Struggle, 39.

NEWS IN BRIEF on page 44 and other pages.

Passing Events.

Notwithstanding the depression in the mining interests of California in 1881, due to the partial stoppage of hydraulic mining, California still holds the second place in bullion production, as will be seen by the tables prepared by Wells, Fargo & Co.'s Express, which we print in another column. Colorado leads by nearly five millions, but California is ahead of all the rest.

This week the weather has been milder than last. The cold wave which spread over the State last week was not alone an infliction to farmers and stock men, but was equally as damaging to the mining interests, as in freezing up the ditches and checking the flow of water, mining operations were quite generally suspended, and cannot be resumed to any extent until warm and copious rains come. Miners say that they never saw water disappear faster than it did last week, the north winds seeming to lap it up, and, in addition to this, the intense cold put a check upon the sources of supply. There is but little snow in the mountains with which to make water to fill the ditches, and without warm or rainy weather the miners see no prospect of washing to any extent during the winter. To all present appearances, they will have to wait until spring before doing any important work toward reaping the annual gold harvest.

We shall next week issue a 24-page edition of the MINING AND SCIENTIFIC PRESS, containing our annual mining review, and giving very full statistics of the mining industry on this coast.

THE MINING AND SCIENTIFIC PRESS is the oldest mining journal on this coast, and has been devoted to the interests of the miners since its inception. It should receive the hearty support of the mining community, as none who want to keep posted on all new processes and appliances, can afford to be without it.

Our Annual Review.

In the next number of the MINING AND SCIENTIFIC PRESS we will give a very full review of the mining industry for the year 1881. This will contain statistics of great value for reference and facts of importance for all interested in mining matters. The number will be an unusually interesting one, and will consist of 24 instead of the usual 16 pages.

Engineering Improvements Wanted.

The river and harbor appropriation bill each year is one over which the committees have a grand fight on reducing estimates. All the seaboard States want more or less done to their harbors and river mouths. The Atlantic coast, with its numerous harbors and large population, has had an advantage over us in securing aid of this sort, yet our representatives persevere in bringing our wants to public notice. California got a little money to fix up San Diego harbor; and more for the improvement of Wilmington and Oakland. Outside of a little snag pulling up the river, this is about all we ever got.

Oregon has got a good many rivers emptying into the sea, but she is sadly deficient in harbors, and her rivers all want more or less doctoring at the mouth. Each year appropriations are asked for to this end, but with comparatively little effect so far. This year, Congressman George has introduced a bill proposing the following appropriations for the improvement of Oregon and Washington Territory rivers and harbors: For the permanent improvement of the mouth of the Columbia, as recommended by Col. Gillespie, U.S. Engineer, $430,000; for constructing a Pacific Coast Harbor of Refuge at Port Orford, $250,000; for the Cascade Locks, $750,000; for the lower Willamette and Columbia, $133,000; for Coos bay, $60,000; for Yaquina bay, $60,000; for Coquille har, $25,000, and for the river above, $25,000; for the upper Columbia and Snake rivers, $20,000; for the upper Willamette and Yamhill rivers, $10,000; for the Umpqua river, $12,000; for the Lewis river, $5,000; for the Alsea river, $2,500; for the Cowlitz river. $2,000; for the Sinslaw river, $1,500, and for Young's river, $1,000.

Bullion Product of 1881.

We are indebted to Mr. John J. Valentine, General Superintendent of Wells, Fargo & Co.'s Express Co., for a copy of their annual statement of precious metals produced in the States and Territories west of the Missouri river, including British Columbia (and receipts in San Francisco by express from the west coast of Mexico), during 1881, which shows aggregate products as follows: Gold, $31,869,686; silver, $45,077,829; lead, $6,361,902; copper, $1,195,000. Total gross result, $84,504,417.

California shows a decrease in gold of $579,069, and an increase in silver of $323 582. Nevada shows a total falling off of $3,184,057; the yield from the Comstock being only $1,726,162, as against $5 312,592 in 1880—a decrease of $3,586,430. The product of Eureka district is $4,127,265, as against $4,639,025 in 1880—a decrease of $511,760. Utah shows an increase of $860,335. Colorado shows an increase of $1,672,171; and Arizona, $3,726,295 over our report of last year.

Statement of the Amount of Precious Metals Produced in the States and Territories West of the Missouri River, including British Columbia (and Receipts in San Francisco by Express from the West Coast of Mexico), During the Year 1881.

States and Territories.	Gold Dust and Bullion by Express.	Gold Dust and Bullion by other conveyance.	Silver Bullion by Express.	Ores and Base Bullion by Freight.	Total.
California	$16,349,216	$817,460	$588,882	$305,421	$18,060,979
Nevada	650,902	33,254	7,585,274	3,826,438	11,847,764
Oregon	67,309	3,364	40,681	1,000,000	1,111,354
Washington				13,000	13,000
Alaska	1,046,618	52,330			1,098,948
Idaho	1,186,820	59,341		1,007,386	2,253,547
Montana	1,907,150	95,358	370,540	689,800	2,962,848
Colorado	32,944	1,647	2,305,728	3,567,863	5,907,182
New Mexico	3,225,960	161,298	2,820,000	18,705,000	24,912,258
Dakota	396,697	19,834	77,000		493,531
Arizona (west coast)	132,232	6,611	6,278,895	1,390,942	7,808,680
Oregon (west coast)			1,699,216	301,000	2,000,216
British Columbia					872,500
	$30,019,223	$1,188,503	$35,567,824	$30,253,490	$84,504,417

The bullion from the Comstock contained 47.54% gold and 52.46% silver. Of the so-called base bullion from Nevada 44.70% was gold; and of the whole product of the State, 26.53% was gold.

The gross yield for 1881, shown above, segregated, is approximately as follows:

Gold	37.71%	$31,869,686
Silver	53.35%	45,077,829
Lead	7.53%	6,361,902
Copper	1.41%	1,195,000
Total		$84,504,417

Annual Products of Lead, Copper, Silver and Gold in the States and Territories West of the Missouri River, 1870-81.

Year.	Products as per W. F. & Co.'s Statements, including Amounts from British Columbia and West Coast of Mexico.	Product after deducting Amounts from British Columbia and West Coast of Mexico.	The Net Product of the States and Territories west of the Missouri River, exclusive of British Columbia and West Coast of Mexico, divided, is as follows:			
			Lead.	Copper.	Silver.	Gold.
1870	$54,000,000	$32,150,000	$1,680,000		$17,230,000	$13,240,000
1871	58,284,000	35,798,000	2,100,000		19,386,000	14,312,000
1872	62,236,359	40,351,824	2,236,000		19,924,429	18,191,395
1873	74,208,683	50,139,860	3,450,000		27,183,302	19,206,558
1874	72,703,133	49,000,000	3,500,000		24,939,122	20,560,878
1875	80,889,057	47,705,433	5,000,000		28,406,483	14,298,950
1876	90,875,373	57,219,859	6,194,000		33,937,934	17,087,925
1877	79,431,754	49,811,682	5,086,250		29,382,324	15,343,108
1878	81,154,622	49,276,167	3,452,000		41,846,119	33,978,503
1879	86,138,638	72,688,893	4,185,769		37,032,857	31,470,262
1880	84,504,417	81,158,474	6,361,902	1,195,000	37,248,137	37,576,000
1881					38,633,055	32,569,167
					42,387,613	30,655,359

The exports of silver during the present year to Japan, China, India, the Straits, etc., have been as follows: From Southampton, $21,000,000. From Marseilles, $1,000,000; San Francisco. $5 000,000. Total, $27,000,000 as against $34,700,000 from the same places in 1880.

Slides in the Rivers.

In the course of an examination as witness in the debris trial, Daniel C. Webster, of Volcanoville, El Dorado county, said: Above Volcanoville, there are some 50 or 60 natural slides, large and small. One above Pilot creek is some three-fourths of a mile long and 40 rods wide, and of an average depth of 20 ft. One is further up on the north side of the South Fork, of at least 40 acres, but I never measured it. It is about 1,500 ft. long and 100 ft. deep. Another is on the middle fork of the Middle Fork. It is at least 40 acres, but not so deep as some. Another, on the side of Mount Gregory, is three-fourths of a mile long and one-fourth of a mile wide, and from 10 to 20 ft. deep. Another is at where Volcanoville canyon empties into the river. It has gone out, in part, 200 ft. deep. It is a mile long. I've seen others still higher up on the Middle and South Fork. I've seen them at a distance. Around Volcanoville are a number of small ones. These slides in the South Fork expose soft granite; on the Middle Fork it is slate. This exposure washes continually, and forms common sand, and it goes into the South Fork, and from there to the Middle Fork, and I suppose must reach the Sacramento. That which will come in the future into the river will be very heavy material and hard to work out. That recently deposited, say within five or six years, is heavy. It is now in the bed of the Middle Fork. That bed has been filled for eight miles on an average to a depth of 30 ft. Where deep pools and riffles were, now is all filled up. Above Ford's Bar, near the mouth of Otter creek, the fill is 40 ft. I know of instances where this material has recemented in the bed of the river. In working this material the second time it has to be blasted with powder. This material is almost as compact as it was in its natural or original bed.

MR. J. F. OSBORNE, who has been successfully connected with the business of this office during the past two and a half years, will hereafter act as assistant business manager, and we bespeak for him the favorable attention of our many friends and patrons.

Drift Mining.

The Cost

Of running the main tunnel and all shaft work in the bedrock varies with the character and hardness of the latter. In soft slate, talcose rocks or serpentine it will cost as low as $6 or even less per foot, including the timbering and lagging. Harder rocks cost considerably more, $15 and $20 per running foot in some extremely hard slates. In blasting the harder varieties of rocks giant powder is used; black powder is found most effective in soft serpentines and similar rocks. The most economical way for the mine owner to run the tunnel, and in fact, to do all the underground permanent work of drifts, tunnels, shafts, winzes, etc., is by contract. Such is the practice in most of the large drift mines.

As soon as this main working tunnel is underneath the center of the channel, an upraise or incline, preferably the former, is made through the bedrock to the gravel. If it is not intended to continue the bedrock tunnel any further an incline is sometimes preferred, more particularly, if through it all the timbers and other material used in the mine are to be taken. Both are constructed in two compartments, one for gravel, and the other containing a pipe for the drainage and ladder for the men.

Considering that the tunnel is to be continued, and that a vertical shaft or upraise has been made from the point on the surface of the bedrock where the upraise enters the gravel, a main drift or tunnel is run, following the course of the channel. The course of the lower bedrock tunnel is made to correspond exactly with the course of this main drift in the gravel; and every 100, 125 or 150 ft., as the case may be, a connection is made between the two, by an upraise from the lower one. At each upraise, a cross drift is run in the channel at right angles to the course of the main drift or gangway, as far out on each side as pay gravel is found. Further connections between these cross drifts are made by working drifts parallel to the central one, at distances from it equal to the distances between the shafts. By this means, the ground to be worked is divided into square blocks of any desired convenient size.

It will, of course, be understood, that the method of opening up the gravel deposit described is not general, but rather the exception; in fact, is not always practicable. It is, however, typical of the method employed wherever possible, in the largest and best worked drift mines. Sometimes the bedrock tunnel is not run low enough, and instead of remaining in the bedrock, comes out of it into the gravel. In this case, if in the direction in which work is being prosecuted the bedrock pitches off, it may be necessary to run a new tunnel lower down. Whether necessary or not, will depend principally on the amount of water in the mine.

The Drainage

Of a drift mine is as far as possible by natural means through the lower tunnel. Usually there is a large amount of water in these old channels. In very few drift mines is the quantity to be handled nominal. The water which collects in the mine workings is conducted to the several upraises, that is, where it does not drain directly through the bedrock into the lower tunnel, and passing through them runs in a box or open channel either under the tramway or on one side of it to a large reservoir tank at the tunnel entrance, in which it is stored to be used as required in washing the gravel. In a drift mine worked through either a vertical or incline shaft, a pump of large capacity is almost invariably required. The flow usually increases as the mine becomes more opened, and is more often beyond than within the control of such pumping machinery as can be profitably employed. It sometimes happens that the tunnel running too high will not permit of natural slope drainage, being from 10 to 20 ft. higher than the bedrock of the channel. In this case, the running of a lower tunnel can be obviated by collecting the water in a sump close to the tunnel and drawing from it by means of a siphon regulated to the flow of water.

In the Mountain Goat mine at Damascus, in Placer county, a very ingenious utilization of a portion of the mine waters is made, by which power is obtained for pumping the remainder of the water, and for hoisting the gravel. A detailed description of this mine will be given in a succeeding paper in the series.

Ventilation

Requires considerable attention, but is rarely especially difficult. The workings in the drifting ground are generally connected with the surface by a tunnel or shaft, or both, independent of the bedrock tunnel. This, if a tunnel is termed the air gangway, and runs, connecting with all the cross drifts, preferably on one or the other side of the ground which is being drifted, and not through the middle of it. This gangway is well timbered, and care taken not to disturb the ground too much in its immediate vicinity. A cave closing it, might result in the loss of life among the men employed. Besides its use as an air passage, the miners use it going in and out of the mine, and all timbers, tools, cars, etc., are taken from the surface to where needed through it, thus leaving the lower tunnel exclusively for discharging the gravel. When there is not sufficient difference of elevation and temperature between the two tunnels

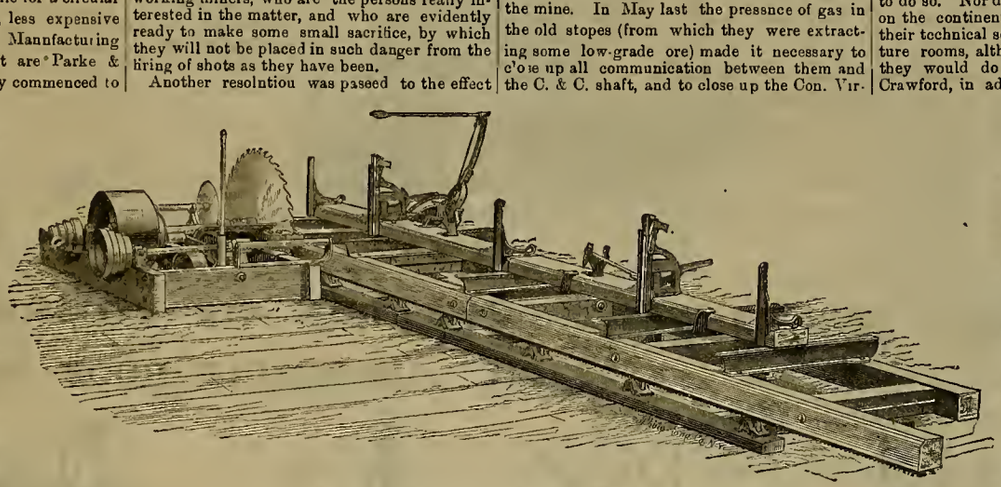
to cause the air to circulate, entering at the lower and leaving at the upper, a shaft is made connecting the air gangway with the surface, and an artificial draught created by the employment of fire. Where there is only one opening to the mine, ventilation is secured by the use of fans, the motive, where possible to utilize it, being the mine water.

Mining of the Gravel.

The main and cross drifts are run in the gravel on the surface of the bedrock, if the latter is hard and compact, containing no gold. Should the bedrock be soft it is liable to, and often does, contain considerable gold, in which case from eight or ten inches to two ft. of bedrock is removed. The gravel coming from the several drifts is washed separately, and from its yield the probable value of the adjacent ground is approximated. The squares into which the ground is divided for prospecting and working are of such size as to admit of the probable yield being estimated. In some channels in which there is little uniformity in the distribution of the gold in the gravel, this method is not practicable to any extent. All of the wider and more extensive channels admit of being estimated by this method. In estimating whether or not a certain block of ground will pay to take out, the gross yield or the yield per carload are not the only factors necessary; the amount of timber and lagging required and the hardness of the gravel must be taken into consideration. No general rule can be given as to what gravel will pay and what will not; the degree of richness which will render the mining profitable is determined by actual working test for each mine.

Improved Circular Saw Mill.

Desiring to meet occasional calls for a circular saw mill of the Lane pattern, less expensive than their No. 1, the Lane Manufacturing Co. (whose agents on this coast are Parke & Lacy, in this city,) have recently commenced to build mills which they call the No. 0, or "Plantation," as represented in the accompanying engraving. These mills are in some respects better and heavier than the earlier mills manufactured under the Dennis Lane patents, but they lack the foot-rig, the upright gauge roll, the double box for saw end of mandrel, the frost-dog and the "round-edge" uprights, included with the higher priced board machines manufactured by this company. The feed and gig back works are of the well-known "spring box friction" pattern—convenient, effective and serviceable. Although not specially recommended for saws larger than 48 inches, these Plantation mills will take on saws 54 inches in diameter.



THE PLANTATION CIRCULAR SAW MILL.

These mills cost with wood frame, 25 ft. carriage, no saw, $350, and other improvements made by the company are added as extra. Though, as this name indicates, this Plantation mill has been designed more particularly to meet the wants of small lumbermen in the South, it will be found adapted to many situations in every section, since it supplies a mill with a good Lane set-works at a price quite as reasonable as is asked for ordinary screw-block or quite defective lever-set mills.

THE PROPOSED PARK AND THE MINING INTERESTS.—We have before mentioned the project of Senator Miller to preserve as a park certain tracts of timber in Tulare, Fresno and Inyo counties. A part of the feeling against the bill in the localities mentioned arises from an objection to its including mining lands, and such timber belts on the extreme western and eastern slopes of the Sierras as can furnish the inhabited and inhabitable valleys with lumber, in the immediate and remote future. The limits stated for the park proposed in this bill would include a large part of such slopes, and would embrace hundreds of mining claims in and around the Mineral King mining district. The opposition to this led the Board of Supervisors of Tulare county to telegraph to Senator Miller, requesting a delay in the passage of his bill, that will lead, it is hoped, to such modification of its terms as will sufficiently protect the lumber and mining interests. A letter in reply has just been received from Senator Miller. He expresses entire willingness to so contract the limits of the proposed park as to leave mining and lumbering districts free. He not only disclaims the slightest intention to cripple these interests, but shows that a chief purpose of the bill is to so protect the mountain forests as to prove a general benefit to the people of Tulare and Owens valley. He desires information that will aid in fixing safe limits to such government reservation.

A MINER named Scoot has arrived in Tombstone, A. T., from the Sierra Madre mountains of Mexico, where he has been living for the past seven months. He states that the Apaches are on the warpath in that region, and that himself and two companions barely escaped with their lives. They had a running fight with 35 Apaches.

Prevention of Mine Accidents.

A miners' conference was held at Birmingham the other day, on which occasion a good many things of interest to miners were discussed. The President, in the course of his address, alluded to the legislation in reference to the use of powder in mines, which has certainly, so far, been most beneficial to the miner without injuring the interests of the employers, although the letter are strongly opposed to the interpretation put upon the clause in the act of 1872 by the law officers of the Crown. That interpretation in many districts is certainly opposed to the interests of the men, who, on the firing of a shot, have to leave the mine, or that part of the mine at least where the blasting is taking place. Notwithstanding the loss that must necessarily accrue to the workmen by leaving off work, the conference upheld the decision come to by the Home Secretary, for a delegate from Yorkshire moved a resolution declaring that the interpretation put upon the clauses of the Mines' Regulation act of 1872 by the law officers of the Crown, relative to the use of blasting powder in mines, was the only real meaning of the act, and that the Home Secretary should be recommended to enforce its general adoption, whenever the act was applicable. The enforcement of the clause as interpreted by the Attorney General and the Solicitor General, although it may have the effect of lessening the output of a mine at certain times, must certainly contribute to the safety of the miners. It may therefore be taken for granted that any attempt made to alter the clause on the part of mine owners will be successfully opposed on the part of the working miners, who are the persons really interested in the matter, and who are evidently ready to make some small sacrifice, by which they will not be placed in such danger from the firing of shots as they have been.

Another resolution was passed to the effect that it was necessary to insert a clause in the Mines' Act making it imperative upon owners to erect at every pit bank a house properly fitted with necessary appliances of every description to relieve the various kinds of accidents which are so frequent in mines, and that they should also provide some fitting conveyance to take home those who have been taken by accidents in the mines. At many mines there are now the most approved ambulances by which injured persons are taken to their homes in something like a Christian manner, without unnecessary pain, but there are still other places where these have not been adopted. An old, springless, jolting cart has been the ordinary mode of carrying a poor fellow in the agonies of death from where he has been working active and strong to the house from which he may never walk again.

Machinery Not "Locatable."

The quicksilver claims near Steamboat Springs, Washoe county, Nev., have been relocated as abandoned, no work having been done on them for two years. We notice that one of the Nevada papers, usually better posted, says that the works, said to have cost $30,000, are on the ground, and become the property of the relocators. This is wrong. The Government can not compel a man to work a furnace or a steam-engine, and spend so much a year on it. Such things never belonged to the Government, as the mineral land did, so that a failure to comply with conditions imposed by the Government on the locators of the lands can by no possibility be made to throw a man's steam-engine or furnace "open to relocation." Buildings, tools, machinery, etc., belong to the man who paid for them, and he can claim them any time. The relocator of a mine must account for anything of this kind he finds, provided the original owner appears. This is nothing which the Land Office or the Government has anything at all to do with.

In fact, it was not long since decided—and we published the opinion of the Commissioner at the time—that ore from the claim, not out on the surface at mouth of tunnel or shaft, belonged to the man or men who got it out, not to relocators of the mine. Therefore, if a miner relocates a mine, he has no right to the ore already taken out, and in case the original owner comes along, he can make him account (in the courts) for the ore he left there, provided an unreasonable time has elapsed.

A good many men seem to have this erroneous opinion, that machinery, etc., is relocatable because the claim is. A moment's thought will prove the fallacy of this belief. The Government gives the land, or mine, to any one who will work it, under certain conditions, failure to comply with which results in a forfeiture of the right, which then lapses again to the Government, which can then, and does, give it to the first man who finds it abandoned. The principle is a good one and has worked well since it was inaugurated, May 10, 1872.

But the Government cannot take away a man's machinery or tools because he has not used them on the mine. It never had any title to them, and so cannot say the first man who finds them can take them. This is an simple a proposition it seems scarcely debatable, yet that there is an erroneous impression prevalent is shown by the fact that a newspaper familiar with mining matters, should give publicity to such a statement as we have referred to.

The Consolidated Virginia Mine.

The famous Consolidated Virginia mine during the past year produced 6,435 tons of ore. There were reduced 6,816 tons, yielding bullion worth $144 064.10, or $21.13 per ton. This yield was over 81% of the assay value of the ore, no allowance being made for moisture. There were also 8,307 tons of waste rock taken out of the mine. In May last the pressnce of gas in the old stopes (from which they were extracting some low-grade ore) made it necessary to close up all communication between them and the C. & C. shaft, and to close up the Con. Virginia shaft (which was at that time a strong upcast) with the view of smothering any fire that might exist, and preventing the gas interfering with the progress of work in other portions of the mine. The closing of the Con. Virginia shaft made it necessary to change the Ophir shaft from a down-cast to an up-cast, which condition was maintained until September, when they were enabled to reopen the Con. Virginia shaft and turn the Ophir shaft a down-cast again, taking precautions to prevent any fire that might remain in the old stopes from spreading, and confining the gas arising therefrom to that part of the mine. The work of bulkheading the drift connecting the old stopes with the Gould & Curry on the south, Ophir on the north, and the C. & C. shaft on the east, and the changing of our air current and system of ventilation, seriously interfered with the progress of work in the mine during the four months it was in progress. In November last, the Con. Virginia Co., jointly with the Best & Belcher and Gould & Curry companies, erected a large suction or exhausting fan on the old Gould & Curry shaft, which, by at least doubling the upcast capacity of that shaft, materially assisted the ventilation of the lower levels through the systems of drifts and winzes connecting with it.

The 1650 and 1750 levels produced 6,435 tons of low-grade ore during the year, the extraction of which was interrupted by the necessity of closing up the stopes as described above. There yet remains some low-grade ore in places, which may be extracted at some future time.

The superintendent says in his report: A large amount of necessary dead work has been done, and we are now in a better condition to prosecute our explorations in depth that at any previous time.

A FAN has been placed in position in the east drift on the 2,275 level of Overman which is aiding ventilation. A crosscut has been started from the south drift, which is in 45 feet, and has struck several stringers of ore.

BRUSH ELECTRIC LIGHT.—The works and office of the California Electric Light Co. will be moved about Feb. 1, to Jessie St., between Third and Fourth—rear of Grand Opera House.

AT the Crown Point about 600 tons of low grade ore are extracted and reduced each week

Technical Education.

In recent numbers of the MINING AND SCIENTIFIC PRESS we have given attention to this important subject, and it is greatly to be hoped that the city of San Francisco will before very long take some steps in this direction, if it hopes to become more of a manufacturing center. Those who have studied the signs of the times cannot doubt that technical education is forcing itself more and more to the front. Towns which take the matter in hand will have a much better chance of maintaining their position than towns which do not. The rule of thumb and practice of our forefathers will not do now. We must ask the why and wherefore; we must separate the right from the wrong; we must know how to retain the one and what to substitute for the other. Technical education enables us to do all this, and before this century elapses, such instruction should be provided in every large town.

In addressing a public meeting in an English town the other day, a gentleman who had had considerable experience in this kind of instruction, told the audience about what had been done at Wigan, where several evenings in each week they passed through the class rooms a hundred students, and had upon their books last session 200 names of persons, of all ages from 12 up to half a century. Some of Mayor Taylor's remarks will answer some questions which may arise in the reader's mind.

"It might be asked, what did they teach them? Did they make them engineers and colliery managers and miners and ironworkers and builders? No, they did not, and did not profess to do so. Nor did they go as far as many towns on the continent, and have in connection with their technical school workshops as well as lecture rooms, although he hoped and believed they would do so some day. Indeed, Lord Crawford, in addressing their students a few weeks ago, advised this to be done. What they did was this: They explained the principles of mining, the methods of ventilation, the composition of gases met with in coal mines, the causes of accidents and how to prevent them. They explained the principles of iron and steel manufacture, the materials used and results obtained. They explained the action and cause of the action of the steam engine and other machines. In addition to this, they made visits to engineering establishments, mills, factories, printing works, and iron and steel works; and they descended mines and saw operations below ground. This was what in Wigan they called technical education, and it simply meant that they gave their students a knowledge of those scientific principles essential to the progress of their particular avocation. He claimed this for his own town of Wigan and its surroundings, that more progress had been made in extending and improving their staple industries during the last 25 years, than during any century previous. It was remarkable that the Wigan Mining and Mechanical school was established exactly a quarter of a century ago. He might be thought to assume too much, that the advancement of his town and neighborhood had any connection whatever with technical education. But he was, nevertheless, bold enough to hold the opinion that a technical school which, during its existence, had passed through its hooks several thousand students, some of whom were now mining engineers, mechanical engineers, iron-masters, coal proprietors, inspectors of mines, colliery managers, and which drew from all parts of the county each session aspirants for similar positions, must have done and be doing good."

CORRESPONDENCE.—Friends of the MINING AND SCIENTIFIC PRESS in the various towns and camps throughout the coast are respectfully asked to send us items or notes concerning the mining affairs of their localities. Courtesies of this kind will be gratefully appreciated and kindly reciprocated. It is not necessary to be skilled writers to do this. Send us the notes, and we will put them in shape for publication. Write plainly, on one side of the sheet; be careful about writing names, etc., and we will attend to the rest. There are many isolated places that our readers would be glad to hear from; and we do not want to have to notice always the prominent mines only, about which plenty is written. Tell us about the prospects and developing claims, the resources, needs and wants of the region. People who will tell us about such things we cannot hear from too often.

YESTERDAY Wells, Fargo & Co., received 32 car loads of Horn Silver bullion, valued at $80,000. This is the largest shipment ever made in one day by any mine in the United States since the famous days of the Comstock bonanzas. So says the Salt Lake *Tribune* of the 11th.

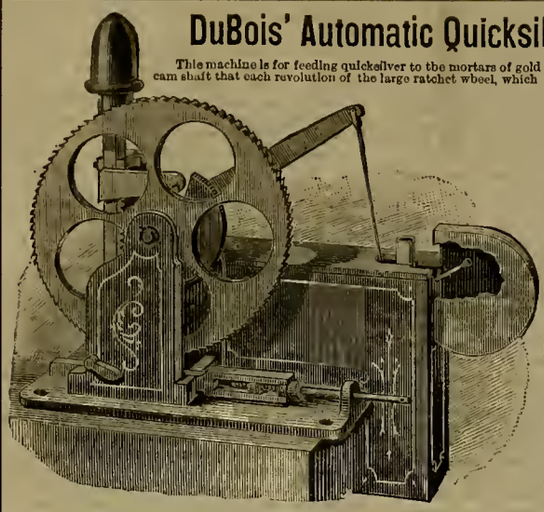
Manufacturers of
THE PATENT CHANNEL IRON WHEELBARROWS.
THE STRONGEST BARROW MADE. These Barrows are made by Superior Workmen, and of the best material. All sizes kept constantly on hand
SHEET IRON PIPE.
Lap-Welded Pipe, all Sizes, from Three to Six Inches. Arteeian Well Pipe. Also, Galvanized Iron Boilers, from 25 to 100 Gallons.
Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools supplied for making Pipes. Estimates given when required. Are prepared for coating all size of Pipes with a composition of Coal Tar and Asphaltum.
Office and Manufactory, 130 Beale Street, San Francisco.
SHEET IRON PIPE.

DuBois' Automatic Quicksilver Feeder.


This machine is for feeding quicksilver to the mortars of gold mills. It is so connected to the cam shaft that each revolution of the large ratchet wheel, which can be regulated to revolve once in one, two, three or four minutes, as desired, dips a small cup into a reservoir of quicksilver, and by a trip of the cam, empties the contents into a pipe leading down to the mortar, supplying an exact quantity at regular intervals, superseding the ordinary hand feeding, which is of necessity subject to great irregularity, and liable to neglect. It renders the amalgamation of all the gold in the pulp equally certain and perfect.
The mechanism to produce this depression and elevation of the cup, is driven by the cam shaft, similarly to the self-feeders, over which so much ingenuity has been expended to regulate the delivery of ore to the mortar. As it is to be desired to have the ore go in constantly and regularly, so it is equally desirable to have the mercury fed constantly and regularly.
A chief point of excellence of this machine is, that it allows the quantity of mercury which would be otherwise fed in mass, in one hour, to be subdivided into a number of small portions, and fed almost continuously; *i. e.*, from every one to four minutes.
Price, complete, $100.
For Sale by **WHITNEY & MARSHALL,** Sole Agents
22 & 24 Fremont St., San Francisco.
Dealers in Iron, Steel, Hardware and Mining Supplies, Wrought Iron Pipe and Fittings, Pump Columns, Wire Rope, etc. A large stock of Boiler, Plate and Sheet Iron of every description.

MOREY & SPERRY,
MANUFACTURERS OF
Gold and Silver Grinding and Amalgamating Machinery
HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.
IT HAS BEEN FULLY PROVED AND TESTED.
It weighs complete, 7,000 pounds It costs $1,500 ready for the belt Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.

Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver ores Chloridizing Furnaces, Retorts, Rock Drills Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill supplies Iron Work complete for Wood Frames, also
SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.
☞Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.
MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

LEFFEL'S IMPROVED WATER WHEEL.

Formerly of Columbia College School of Mines, now of Colo State School of Mines, will examine, survey and report on property or methods. Box 409 Golden, Col.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, No. 252 Market St., S. F.

FOR THE WEEK ENDING JANUARY 3, 1882.

251,819.—SELF-CLOSING STOPPER FOR BOTTLES—David Berry, Bolinas, Cal.

251,849.—HYDRO-CARBON BURNER—E. A. Edwards, San Buenaventura, Cal.

251,857.—STOVE PIPE—A. Flohr, Sacramento, Cal.

251,715.—HAND LEVER ATTACHMENT FOR STEAM PUMPS—Wm. D. Hooker, Oakland, Cal.

251,902.—BOTTLE COOLER—C. H. Lanfketter, Sac'mento.

251,909.—SOLDERING APPARATUS—Albert Lusk, S. F.

251,786.—BASIN PLUG—J. C. Luding, S. F.

251,799.—SELF-FEEDER FOR THRESHERS—John Scholl, Elk Grove, Cal.

251,966.—TICKET HOLDER—Jas. G. Tait, Stockton, Cal.

251,984.—GRAIN CLEANER—Wm. Williamson, Rio Vista.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

DIRECT-ACTING ENGINE.—George E. Dow, S. F. No. 252,084. Dated Jan. 10, 1882. This invention covers certain improvements in direct-acting steam engines, and it consists in a novel combination of main and auxiliary valves and ports and the supplemental pistons, so that both valves are driven by the direct motion of the auxiliary piston. The necessary amount of lead is given to the auxiliary valve by making the main valve somewhat shorter than the recess in the piston, in which the valves lie and by which they are driven. By this arrangement, Mr. Dow is better able to control the movements of the engine, particularly at the point of reversing, as the main valve has at that time moved gradually to the center of its travels, or lapped positions, thus automatically closing its ports, both induction and eduction. This admits of working the main steam piston very closely to the cylinder heads with safety, as the slightest acquired momentum of the piston and its connected reciprocating parts reverses the main and auxiliary valves immediately after reaching the normal point for the change of stroke. The effect of this is to give a live steam cushion and release from the acting side of the piston, without the great clearance space employed in other engines operated by steam-moved valves. Mr. Dow applies his invention to his direct-acting steam pump, two very large ones of which type have lately been put in the new sugar refinery of Mr. Spreckles.

HARNESS AND TRACE COUPLING.—Geo. W. Hunter, Merced, No. 252,108. Dated Jan. 10, 1882. This invention relates to certain improvements in devices for readily connecting parts of harness together, or for attaching the same to vehicles; and it consists in the employment of a peculiar link attached to the strap or trace and having a cylindrical bolt with a flattened head. This bolt is fitted to enter a hole formed in the head of a shank or pin which is driven or screwed into or otherwise secured to the singletree, pole, neck-yoke, etc., and one side is slotted, so that the side bar of the link may pass through as the belt is inserted. The link is then turned around until the side bar is at the opposite side from the slot, and is thus locked in place. The hole in the fixed head is made eccentric with its periphery, so that when the link has been turned around it will bind and prevent noise or rattling.

SPRAY NOZZLE.—Peter Loog, D. C. Vestal and A. F. Meregot, of San Jose. Dated Dec. 27, 1881. No. 251,448. The invention is a spray nozzle for a hose or pipe, the object of which is to eject water or other liquid in a fine spray, so that it may lightly and gently cover the object against which it is directed. The invention consists in providing a hose nozzle with an elongated oval slit or aperture, contracted at its ends and widening at its midleugth, for the passage of the water, whereby it is sprayed. It also consists of sundry details of construction.

PAPER BAG MACHINE.—A. Beyer, Oakland. Dated Dec. 27th. No. 251,402. This invention relates to certain improvements in that class of machines used for making paper bags; and it consists in an improved construction of the forming and folding blades, and in the addition and application to the ordinary general operation of folding the paper into bags of a novel means of pasting the bags, and also for printing any desired design or label thereon.

WINDMILL.—Thos. Martin, San Jose. Dated, Jan. 10, 1882. No. 252,116. This invention relates to windmills and to improvements in the construction of certain parts thereof, whereby the inventor is enabled to provide a strong and useful mill. These improvements consist in the construction of the wheel and the blades.

Early Locators.

It is a singular circumstance, and quite assed as singular, that the reputed discoverers of the most prominent ore deposits in Nevada and California early met with a terrible fate. It is recorded that Allen and Hosea Groesoh, as early as 1853, reported the discovery of a silver ledge lying east of and along the side of Sunrise peak, since called Mount Davidson. These brothers had some knowledge of geology. The discovery they made was subsequently named the Comstock lode, in compliment to a Carson merchant. The Groesch brothers were unable to work their discoveries for want of water, chemicals and machinery. In 1857 they determined to prosecute their find by procuring the necessary facilities; but before they could consummate their plans, Hosea died from the effects of a pick wound in the foot. Allen then started for San Francisco to procure machinery. He was caught in a storm, and reduced to the extremity of subsisting on his own mule. He was rescued, but subsequently died from the effects of that exposure. But for these circumstances, the great silver deposit of Nevada might have borne another name.

Hardly less melancholy was the fate of the discoverer of what has since become a prominent mining camp in California. It is recorded that the ore discoveries at Bodie, Mono county, California, were made in 1859 by W. S. Body, of Poughkeepsie, N. Y. The district was named the Bodie district, after the discoverer, but it was subsequently ascertained that the name should have been Bodie, instead of Body. The first quartz claim was taken up in August, 1859, and was known as the Montauk, now known as the Goodshaw. In March, 1860, while returning from Monoville with E. S. Taylor, they were overtaken by a storm and lost their way. Mr. Bodie became exhausted, and Mr. Taylor attempted to carry him, but was compelled to wrap him up in a blanket and leave him, while he proceeded for help. Before he returned, Mr. Bodie was dead. During the same year Mr. Taylor was killed by the Indians near Benton, in the same county. Thus perished four persons intimately connected with two prominent mining districts.—*Pioche Record.*

Willis Mining District.

From a private letter from Willis mining district, Kern county, California, we gather the following facts: We think we have the starter here for a pretty good mining camp. We are two miles about south of the North Fork of Kern river, and between Erskine creek and the South Fork. The ledges are all of them of a good size, and those that have been sunk on have developed pretty good ore—chloride and horn silver; one mine at 25 ft. Some ore has assayed $1,980 per ton, some $1,600, and some $1,000. The last two are on the same lead. The mine from which the first-mentioned ore came is about one mile south of the latter, the ledges running parallel. From late information at the district recorder's office there were about 26 locations and six different prospecting camps.

Some galena ore has been found in the same neighborhood. The owners of the Last Chance, whose ore assayed $1,900 per ton, are going to sink 100 ft. on their mine. They have an offer for it if it holds out at 100 ft. as it is now.

Pacific Coast Weather for the Week.

[Furnished for publication in the PRESS by NELSON GEROM, Sergt. Signal Service Corps, U. S. A.]

The following is a summary of the rainfall for each day of the week ending Wednesday, Jan. 18th, at noon, for the stations named:

Date.	Olympia.	Portland.	Roseburg	Red Bluff	Sherman'to	San Francisco	Vinalia.	Los Angeles.	San Diego.	
Thursday.	.00	.00	.00	.00	.00	.00	.00	.02	1.53	
Friday....	.00	.00	.00	.00	.00	.00	.00	.04	*

*Reports missing.
Dash (—) signifies too small to measure.

DEPREDATIONS upon the Government timber lands in the West have increased to such an extent that the Secretary of the Interior urges the Attorney-General to use all the means in his power to arrest and punish offenders. While they are about it, the idea would be a good one to arrest and punish offenders who commit depredations on Government funds in the East. That would make work at both ends of the line.

THE Supt. of the Senate folding room says he now has on hand, belonging to Senators, at least 500,000 volumes that have been printed by order of Congress for distribution. Some Senators and Representatives are very indifferent about sending out documents, while others not only send all they are entitled to, but get from other members all they can and send them to their constituents.

News in Brief.

SILVER ore has been found near San Luis Rey, San Diego county.

EMPEROR WILLIAM is anxious for Germany to participate in Arctic exploration.

MR. LORING, Commissioner of Agriculture intends visiting California in the early spring.

SMALLPOX is very prevalent among the colored population of Virginia and the Carolinas.

A BILL has been introduced in the House for the admission of Washington Territory as a State.

THE Cremation Society of New York has secured half of the $25,000 required to erect a furnace.

IN the first of the three matches between Dr. Carver and Bingham, the former killed 126 and the latter 123.

ONE hundred and fifty years ago London was famous for her roses, but to-day no rose will grow there. Cause, smoke.

IT is safe to say that the outward and inward tonnage of Puget sound for the year 1881 aggregated about 1,000,000 tons.

IT is stated that the De Lesseps Canal Co.'s second call of 25%, amounting to $15,000,000, has been paid in full at Paris.

A CHICO fruit-raiser has just leased 12 acres of orchard to Chinese for five years at a yearly rental of $800, or $66⅔ per acre.

ON Puget sound there are 42 steamers with an aggregate tonnage of 4,850 tons. These are all engaged in the Puget sound trade.

THE Mexican National railway has been completed across Tamaulipas, and is being laid at the rate of a mile a day in Nuevo Leon.

THE taxable property of Oregon, as per assessment just completed, is $59,256,175; total tax, $325,908. Multnomah county bears one-fourth of the tax.

MAJOR CATHCART, one of the principal members of Gen. Fremont's expedition, which, in 1848, made a winter journey across the plains to California, is dead.

DR. DRAPER'S death elicits fresh recognition in England of his works, which are among the most enduring and admired American contributions to the literature of science.

A MARSEILLES correspondent mentions that intense cold weather prevails on the Sahara frontier, and hundreds of camels and many soldiers have died from the cold.

A SURVEYING party, with a complete outfit, under the charge of the Atlantic and Pacific railroad, left Los Angeles last Sunday to run a new experimental line on the Mohave desert.

THE contempt proceedings in the Marysville courts against the Bloomfield and other mining companies, have been continued until February 6th. This is the fourth continuance of the proceedings.

THE next sailings of the Pacific Mail Steamship Co.'s steamers will be: *City of Peking*, for Yokohama and Hongkong, Feb. 11; *Australia*, Feb. 11, for Sydney and Auckland; for New York, via Panama, Feb. 4.

GOVERNOR SAFFORD is withdrawing his interests in Arizona Territory for the purpose of devoting himself entirely to the great Florida land reclamation scheme, in which he is largely interested.

THE exceedingly cold weather for the last few days has frozen ditches and flumes in Nevada county until mining has been somewhat suspended, owing to the water supply being choked off.

LAST Thursday of last week snow fell so deep in the San Gorgonio pass, on the border of the Colorado dessert, as to seriously hinder the trains of the Southern Pacific railroad, a circumstance never known before.

THE California Iron Company has recently purchased 4,600 acres of timber and mineral lands. The company now owns 7,620 acres near Hotaling. Clipper Gap made a successful run last year, producing 4,414 tons, and now takes its place as one of the permanent industries of the State, and is in strong hands.

Mining and Scientific Press.

THE MINING AND SCIENTIFIC PRESS is the leading mining journal in America, and enjoys a larger circulation among the more intelligent operators and workers in the gold fields of the world.

Established in 1860, it has firmly maintained its position as a reliable, progressive journal. The information given in its columns has saved millions of dollars to the practical miners, metallurgists, mill men, mine and shareholders on the Western side of our continent.

Among its contributors are the ablest and most experienced mining engineers, superintendents and practical miners in this country.

The PRESS gives a condensed summary of Mining News from the most important mining districts of the country.

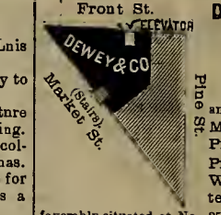
New processes and methods of mining are described in its weekly issues. New mining machinery and improvements are frequently illustrated and explained in a manner to be of great value to all interested in mining.

As a scientific and mechanical representative of the Pacific coast it is decidedly popular, and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivalled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer, will find profit by its reading.

Subscription, $4 a year in advance. Sample copies, postpaid, 10 cents.

DEWEY & CO., Publishers.
No. 252 Market St., San Francisco, Cal.



Dewey & Co.'s Patent Agency and Newspaper Offices.

Dewey & Co.'s Patent Agency and the business offices of the Mining and Scientific Press, Pacific Rural Press, Pacific States Watchman and the Fraternal Record are now favorably situated at No. 252 Market Street. Elevator entrance, *No. 12 Front St., S. F.*

Business Offices and Sunny Rooms to Let.

We have some desirable rooms to let adjoining the offices of this paper which will be rented on favorable terms. Stair entrance, No. 252 Market St. Elevator, No. 12 Front St. Parties wishing offices, etc., will do well to call and see them. DEWEY & CO.

Cylinder Printing Press for Sale.

A large cylinder Hoe printing press, for country newspaper work, can be bought cheap by addressing Press, Box 2361, S. F.

Sewing Machines.

Several first-class styles, good as new, will be sold at a bargain. Call on or address H. F. D., at this office.

BOOKSELLERS, STATIONERS, ETC.—Messrs. Payot, Upham & Co., No. 204 Sansome Street, are one of the oldest, most enterprising and reliable firms in the book and stationery trade in San Francisco. Scientific, industrial and foreign publications are a specialty with them. They are also noted for their fine quality of blank book and fine stationery line of goods.

PARSONS receiving a sample copy of the MINING AND SCIENTIFIC PRESS *with this notice marked*, are requested to examine the merits of the same, and consider fairly its claims for support, and if consistent, subscribe for the paper through the P. M. or agent delivering it, or otherwise. We shall send it, on trial, at the rate of $4 per annum for any period the reader may wish. Please notice our terms elsewhere, and if desired, send for further samples and information. Those who can circulate this No. further to our advantage are invited to do so.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $3 per (half-yearly) volume. In cloth and leather binding, $5. These volumes, complete, are scarce and valuable for future reference and library use.

THE State Mining Bureau, No. 212 Sutter street, is open to the public from 10 o'clock A. M., to 5 o'clock P. M. daily, (Sundays excepted). Henry G. Hanks, State Mineralogist.

BY TELEPHONE.—Subscribers, advertisers and other patrons of this office can address orders, or make appointments with the proprietors or agents by telephone, as we are connected with the central systemin San Francisco.

CORRESPONDENCE on mining and other subjects represented by this journal is solicited from all reliable sources. Send us information, early and often, if ever so brief.

COPP'S "U. S. MINERAL LANDS, LAWS, FORMS, INSTRUCTIONS AND DECISIONS."—1881. 570 pp. In full law binding, $4.50; half law binding, $3. at this office.

AMERICAN AND FOREIGN

PATENT AGENCY

NEW OFFICES:

NO. 252 MARKET STREET,

(Elevator, No. 12 Front Street,)

SAN FRANCISCO, CAL.

Branch Offices in all Foreign Countries.

Our Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. CIRCULARS OF INFORMATION FOR INVENTORS sent free on application.

Pacific Iron Works.
Established in 1850.
RANKIN, BRAYTON & CO.
Office—127 First Street, San Francisco, Cal.
Builders of Engines, Boilers, all Classes of Machinery.
PLANTS FOR GOLD AND SILVER MILLS,
Embracing the latest and most Improved Machinery and Processes for Base and Free Ores.
WATER JACKET SMELTING FURNACES,
For both Galena and Copper Ores of the Most Improved Construction.
Having Built nearly every successful working Furnace on the Coast, we are prepared to guarantee the best results attainable in all classes of Ores.
HOISTING AND PUMPING MACHINERY,
Embracing all Known Improvements.
WHEELOCK'S AUTOMATIC CUT-OFF ENGINE,
Beyond Question the most economical and perfect working Engine now made.
WALKER'S COMPOUND STEAM PUMPS,
The best in use. W work with thirty per cent. less steam than any other Pump in the market.
Sole Agents for HOWELL'S IMPROVED WHITE FURNACE.
The only successful Chloridizing Furnace made. Over fifty of them in use on this Coast.
Parties Wanting any kind of Mining Machinery are requested to send for Illustrated Circular.

William Hawkins,
(SUCCESSOR TO HAWKINS & CANTRELL).
MACHINE WORKS,
210 and 212 Beale Street, bet. Howard and Folsom Sts., - - San Francisco.
Manufacturer of
IMPROVED PORTABLE HOISTING ENGINES,
FOR MINING AND OTHER PURPOSES.
Also of the HAWKINS' PATENT ELEVATOR HOIST, for Hotels, Warehouses and Public Buildings.
Steam Engines and all Kinds of Mill and Mining Machinery.

L. C. MARSHUTZ. T. G. CANTRELL.
National Iron Works.
Northwest Cor. Main and Howard Sts., San Francisco.
MANUFACTURERS OF
IMPROVED PORTABLE HOISTING ENGINES.
Stationary and Compound Engines, Quartz Crushing and Amalgamating Machines, Flour, Sugar and Saw Mills
SOLE MANUFACTURERS OF
Kendall's Patent Quartz Mill, National Ore Feeder & Concentrator.
CASTINGS AND FORGINGS OF EVERY DESCRIPTION.

GOLD MINERS
WORKING PLACER, GRAVEL AND QUARTZ MINES,
SAVE YOUR GOLD!
—BY USING—
SILVER PLATED AMALGAMATING PLATES.
The most economical and successful process now in use. Will warrant my Plates to save a very much larger percentage of gold than any other method.
SWING AND RIFFLE PLATES for Saving Float Gold Made to Order.
OLD MINING PLATES BOUGHT, TAKEN IN EXCHANGE FOR NEW, OR RE-PLATED.
ALL KINDS OF METAL GOODS PLATED!
San Francisco Gold, Silver and Nickel Plating Works,
653 and 655 Mission St., bet. New Montgomery and Third, San Francisco.
Send for Circular. EDWARD G. DENNISTON, PROPRIETOR.
Awarded First Premium at Every Fair of the Mechanics' Institute for the Last Twelve Years.

THE RISDON IRON AND Locomotive Works
Corner Beale and Howard Sts.,
SAN FRANCISCO, CAL.
W. H. TAYLOR, Pres't. JOSEPH MOORE, Sup't
Builders of Steam Machinery
IN ALL ITS BRANCHES,
Steamboat, Steamship, Land
Engines and Boilers,
HIGH PRESSURE OR COMPOUND.
STEAM VESSELS, of all kinds, built complete w Hulls of Wood, Iron or Composite.
ORDINARY ENGINES compounded when advisable.
STEAM LAUNCHES, Barges and Steam Tugs constructed with reference to the Trade in which they are to be employed. Speed, tonnage and draft of water guaranteed.
STEAM BOILERS. Particular attention given the quality of the material and workmanship, and none but first-class work produced.
SUGAR MILLS AND SUGAR-MAKING MACHINERY made after the most approved plans. Also, all Boiler Iron Work connected therewith.
WATER PIPE, of Boiler or Sheet Iron, of any size made in suitable lengths for connecting together, sheets rolled, punched, and packed for shipment ready to be riveted on the ground.
HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, riveted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.
SHIP WORK. Ship and Steam Capstans, Steam Winches, Air and Circulating Pumps, made after the most approved plans.
PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.

DODGE ROCK BREAKER
Challenges the World
To produce as good and cheap a Machine. Rock Breaker and Cornish Rolls combined in one Machine. Pulverizers, to Granulate Ores, for Roasting, Chloridizing, Leaching and Concentrating.

Concentrating Machinery!
FOR CONCENTRATING
Gold, Silver, Lead and Copper Ores.
Furnaces for Roasting and Chloridizing Ores, for Amalgamation or Leaching.
Plans, Drawings and Estimates for Working Ores by any process.

San Francisco Pioneer Screen Works
J. W. QUICK, MANUFACTURER,

Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.
32 Fremont Street, San Francisco.

Diamond Drill Co.
The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.
A. J. SEVERANCE & CO.

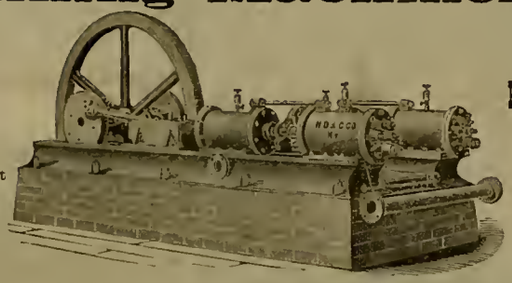
MANUFACTURERS OF AND DEALERS IN

Mining Machinery.

We manufacture the BEST **Air Compressors** Ever driven by belt from Water Power.



Hoisting Rigs. **DONKEY ENGINES** For Pile Driving. **MINING CARS,** Ore and Water **BUCKETS.**

MINERS' HORSE-WHIM.

One Horse can easily hoist over 1,000 pounds at a depth of 500 feet. The Power is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing

CHICAGO FRASER & CHALMERS, ILLINOIS.

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES

Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. P. Haggin for Giant and Old Abe Co., Black Hills; also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Ritteneger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36 31. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful All Rivets Hand Driven.

McCaskell's Patent Car Wheels and Axles—Best in Use.

New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

VULCAN BLASTING POWDER.

—THE MOST ECONOMICAL AND BEST—

Nitro-Glycerine Explosive in the Market.

In the suit of the Giant Powder Co. against the Vulcan Powder Co. for *alleged* infringement of Patent, it was held that the Giant Powder Patent was INVALID.

Nos. 1, 2 and 3 Vulcan,

Each grade superior to like numbers of any other Nitro-Glycerine Powder in the market.

VULCAN B. B.,

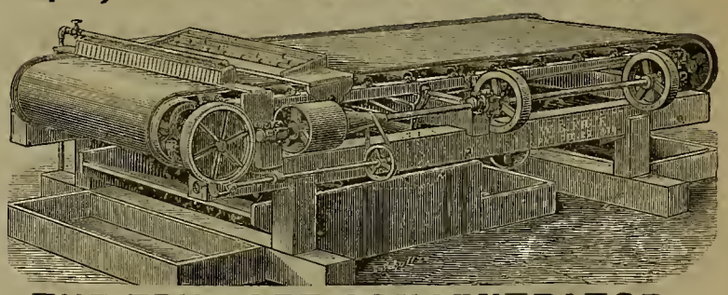
Superior to Black, Judson or any low grade Powder for Bank Blasts, Railroad work, or any work where Black Powder has been heretofore employed.

TRIPLE FORCE CAPS AND ALL GRADES OF FUSE.

The CONSUMER'S COMPANY sell the best Powder at the lowest rates.

Office—218 California St., San Francisco.

$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR.

Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.

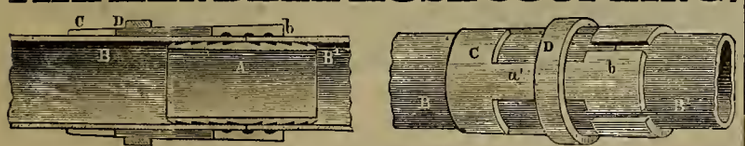
Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.

We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.

☞A machine with all improvements can be seen in working order and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont street.

ADAMS & CARTER, Agents, Room 7 No. 109 California Street, S. F.

THE KENDALL HOSE COUPLING.



VIEW OPEN. PATENTED, MARCH 1, 1881. VIEW CLOSED.

1st. Cheapest. 2nd. No Wire Necessary. 3rd. Can be Attached or Detached with Ease. The whole requiring less than one minute, and so simple that it may be done by a child. 4th. Does not Leak. It is absolutely water tight. 5th. Neatness. In separating it from the faucet, it can be done without filling the sleeve with water, or drowning the body. It is withal ornamental, Examine It! Give It a Trial: I Guarantee Satisfaction! All Sizes Supplied. Address D. B. KENDALL, PATENTEE. American Exchange Hotel, San Francisco.

ENGINE LATHES IN SECTIONS.

Limit of weight for 25-inch Lathes, 300 pounds. For 17-inch Lathes, 150 pounds

Standard and Special Machine Tools.

Good Land and Sure Crops.

There has been steady and tolerably rapid advancement made in the growth of a majority of the towns in Colusa, Butte, Tehama and Shasta counties. Especially is this so in the agricultural districts where the land produces at least fair crops in all seasons—wet or dry—as does the land on the Reading Ranch. Those looking for homes in California where diversified farming will pay every year; where wood and water are plenty and easy to be obtained, and other desirable advantages are to be had, should address the proprietor of the Reading Grant.

Some 14,000 out of 26,000 acres of the grant remain for sale at comparatively low rates, in quantities to suit purchasers, on easy terms. Prices range from $5 to $30 per acre. The tract is between two and three miles wide, with the Northern Division of the C. P. R. R. passing centrally through its entire length. Send postage stamp for free circulars containing information about Shasta County and these lands, to the proprietor of Reading Ranch.

EDWARD FRISBIE,

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free. DEWEY & CO., PATENT AGENTS.

Construction of Mining Flumes.

In the mountaine of California where water ie stored in very large quantities, for nee during the year in hydranlic mining, very many engineering difficultiee are met with in conveying it to the point of nee. Thie ie due to the rngged character of the conntry, formed as it ie of steep monntains, high ridgee, deep canyone, gulchee dry for months and then filled enddenly with foaming torrente of water. Some of the fineet engineering work in the world hae been done in theee monntain regione. We pnblish in this isene engravinge, ehowing some "flume engineering," the novelty of which, we feel satisfied, will be ae eeneihly appreciated hy onr readers ae hy onrselvee.

Althongh we had frequently heard of this particnlarpiece of work, we had not seen anything that wonld enah'e ne to form an opinion ae to ite merits nntil qnite recently, when we were ehown photographe of it, which showed plainly many of the difficnlties met with, and overcome in its conetrnction.

The engravinge we have had made are excellent reprodnctione of the photographe referred to, and give a very distinct idea of the manner in which the work was done, and a general view of it after completion.

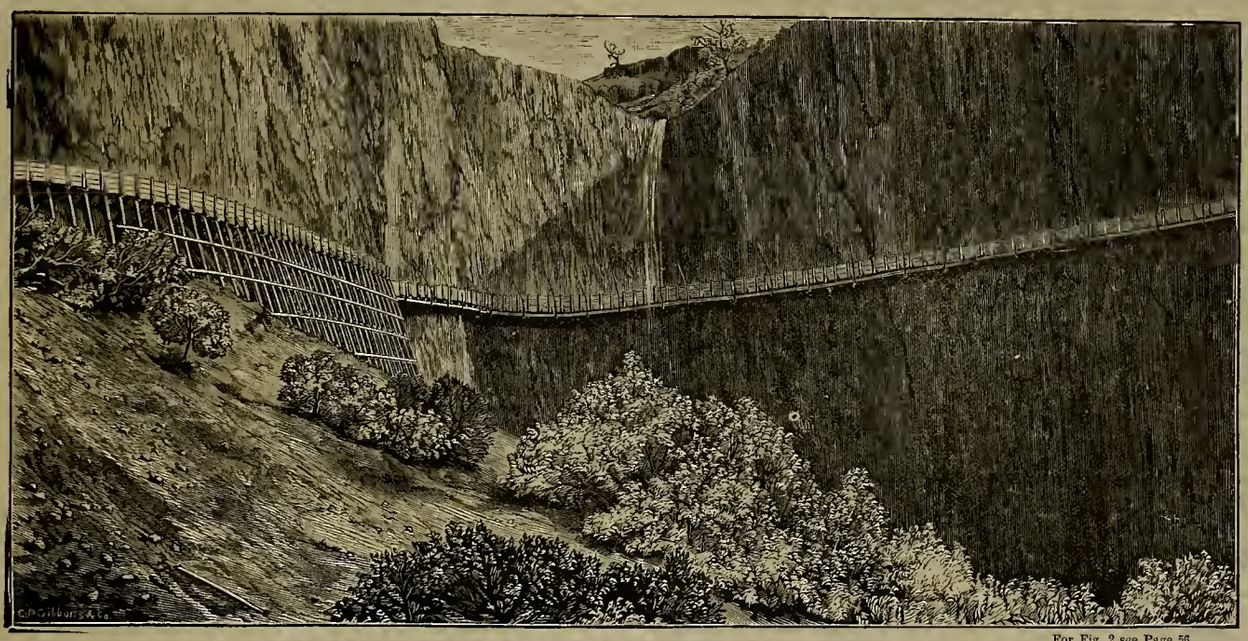

FIG. 1.—BRACKET FLUME OF MIOCENE MINING COMPANY'S DITCH, BUTTE CO., CAL.

For Fig. 2 see Page 56.

It is located at the head of what ie now called "Bracket canyon," in Butte county, in thie State (ahont 10 milee from Oroville), and is a part of the flnming on the Miocene mining company's ditch. It was deeigned hy and constrncted nnder the immediate enpervieion of Mr. Wm. H. Bellows, Supt. of Conetrnction of that compeny's ditch and flumee. In order to eecape the necessity of a treetle-work 186 ft. high, as deeigned hy the engineer who located the line, Mr. Bellowe determined to rnn the line of ditch up the canyon eome 200 yards, where it ends againet a perpendicnlar wall of rock 350 ft. high. Aronnd thie wall the flume was carried on iron hrackete eet eight ft. apart, each hracket capahle of enetaining a weight of 14½ tons. The length of thie bracketed portion is 486 ft. The flume rune around 118 ft. above the hed of the ravine and from the flnme to the top of the cliff ahove ie over 200 ft.

The Oroville *Mercury*, in an article deecriptive of the Miocene ditch, speaking of this particnlar piece of work, eaye: The man that carried the idea into practical form from ite inception to final completion is Wm. H. Bellowe, the engineer in charge of the work. To him was delegated the taek of carrying many hundred feet of flume acroee an inacceseihle gorge, without treetle-work, or other eupport than that which conld he given hy the perpendicular walls of haealt that etand in fluted columns at the head of the ravine. "What man has done man can do," has often heen eaid; hut thie particular kind of work had never heen done anywhere, and as it was wholly without precedent, the hnilt. From the uprights at the eide of the flume rnn euependere, ¾ inch round iron being used; they also having had holes drilled in the rock for their insertion and are clamped and eoldered secnrely. The flume, which is 4 ft. wide, ineide measurement, and 3 ft. deep, having a capacity of 3,000 inchee of water, is a epeciee of work with which everyone hae an intimate acquaintance, and hence need not he decribed here. It was thought hy many that this piece of flnming wae impoesible, and at leest fraught with euch danger ae to deter any man or set of men from working there, hnt not a eingle accident occurred, except in one caee, where the man himeelf wae more careleee than hie enrronndings juetified. Combining, ae it doee, heanty of deeign and strength of conetrnction, the flnme eeeme at a distance to he euepended in the air, and ie an endnring monnment to the skill and energy of ite projectors. It ie helieved that thie ie the only inetance of the kind in the hietory of hydraulic mining where a flume ie carried around a perpendicular cliff in the manner ahove described.

The engraving shown on page 56 repreeente a portion of the hracketed flume, hy which the conetruction can he nnderetood. The engraving on this page givee a general view of the hracketed flnme where it passes around the vertical wall. Thie also ehowe where a etream from above peesee over the flume. An "apron" hae heen put up at the point, to keep any of the water from the fall coming into the flnme. The treetle work shown is 86 ft. high; but in the line of thie ditch, a treetle 136 ft. high has heen hnilt. There ie one place on the ditch where there ie a piece of trestle-work 1,088 ft. long and 80 ft. high—eaid to he the handeomeet piece of work of the kind in the State. The ditch and flume itself ie 33½ milee long. The flume hae a carrying capecity of 3,000 minere' inchee.

ELECTRIC LIGHTING FOR MINES—In a paper read hefore the Inetitntion of Engineers and Shipbuildere in Glaegow, hy Principal Jamieson, of the College of Science and Arte, it was etated that 1,400 or 1,500 lampe for electric lighting had heen fitted up in different large steamere, including *H. M. S. Inflexible* and eome firet-claee paeeenger steamere. He decribed in some detail the conetruction of the Swan lamp and the manner in which the 117 lampe on hoard the *Servia* were fitted up, at a coet of ahout £1,000, or eight guineas per lamp. He remarked that ae yet the electric light wae only ueed in two collieriee—at Earnock and Risca. The mine-ownere were very cautious, and were waiting to eee whether the experiments at theee two places proved enccesefnl. The lamp need in theee collieries wae ae safe ae poeeihle in the moet explocive mixtnre, hnt it had ite drawhacke, and he did not think that in ite preeent form it had any great future hefore it.

TRACK-LAYING. — During 15 daye of this month, the Sonthern Pacific railroad company built and laid, on the eouthern extension of ite road to New Orleans, 145,285½ ft. of track, equal to a fraction over 27½ milee. The longeet distance of track laid during that period in one day was 21,000 ft., or a fraction under four milee. Up to Saturday laet track had heen laid 207½ milee from the eastern end of the Rio Grande bridge, or 203.63 milee eaet of El Paeo. The railroad is running through a comparatively unsettled portion of Texae, hut a line of towns is springing np along the track. One advantage to the conntry is the discovery of water in various localitiee, thue eupplying a want that hae retarded the development of that part of the State.

THERE are 81 mining dietricte in Utah, all of which ehould produce increaeed [quantitiee of ore this year.

Relocation of Placer Claims.

The United Statee lawe which require an annual expenditure to he made on quartz claime, on pain of forfeiture hy relocation, do not require any expenditure on placer claims. Still, under certain circumetances, placer claime can he relocated, viz., where the *local* laws require annual expenditures, and theee expenditnree are not made.

Thie principle ie very clearly etated hy the U. S. Land Commiesioners in a caee where some people proteeted against a patent heing granted to one J. P. Sears for a placer mine in Colorado on the gronnd that $500 had not been expended on the claim. The protestants etated that for the paet ten years, Seare had made no expenditnre for labor or improvements connected with plecer mining upon the premieee applied for; and that neither Seare nor his grantore had expended $500 npon the claim for placer mining pnrpoeee, nor any sum to exceed from $50 to $75, the excavatione, pite, ehafte, cnte, waterboxee, pipee, etc., represented on the plat of eurvey, and referred to by the depnty mineral-snrveyor in the field notee, having heen conetructed and ueed for the pnrpose of supplying certain bathing-housee owned hy Sears *et al.*, with hot water from the hot epringe which flow upon the land; and that conesqnently the certificate of the Surveyor-General that $500 had heen expended upon the claim for labor and improvements was erroneone, the said expenditures not having hsen made for the purpoees contemplated by the act.

The land office did not coneider theee objectione to he pertinent matters of inquiry, and the decision eays: "In the firet place, if Parker and Taylor claimed portions of thie land, it was their duty to have filed adveree claime in the manner and at the time preecrihed hy Section 2325 U. S. Revised Stetutee. They fail to etate when their alleged adveree righte accrned. Secondly, it doee not matter whether Sears hae performed any placer mining work npon the premieee eince the date of application for patent or not, provided no pereon has made a relocetion of the eame. If the local lawe of the miners, or the etatutee of the State, require a certain amount of expenditnree to he made annually in order to maintain a possesory title to a placer claim, undoubtedly a failnre to comply with this requirement would render the land subject to a relocation hy any qualified pereon; hut no relocation was alleged by proteetante."

Two minere crossing Kanaka creek, Sierra county, eaw a gold nngget lying in the creek, and further prospecting resulted in their unearthing three hundred dollare' worth of nnggets. It is thought the gold must have heen loet in the creek yeare ago.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Ede.

Barker Mining District, Montana.

EDITORS PRESS:—This district, discovered ahont two years ago, has assumed considerable importance dnring the past few months and hids fair to be the coming hoom. It is situated in the Bell rangs of mountains, abont 75 miles sontheast of Fort Benton, in Msagher county, near its northern limits. Several hundred locations hsve been made, but ths developments are of the most superficial character save upon ahout half a dozen of them. The country surronnding the mines is dsnsely timhered and well watered. Iron ore is abundant and limestone also.

The Country Rock

Is primitive granite. The gsneral character of the ores of the district is argentiferous galena mixed with qnartz, and iron and copper pyrites, some of which carries considerable gold. There has heen discovered hut a few prospects that show fres milling ore, though some very fine bunches of chloride, horn silver and hlack snlphurets have heen fonnd, and thess will doubtless lesd to some good finds of that class of ores. As before stated, the amount of development has not amounted to much. It is, therefors, impossihls to form more than a mere conjecture of the value of the district as a whole.

The Barker, the Oldest Location,

Is also in the van in devslopment. Ths lode has been cut hy a fifty-foot tunnel and a level extended along the oro body for a similar distance, and this is pushed as rapidly as possihle. The mountain is so steep that ons foot added to the level gains nearly that much in depth. A shaft is being sunk that has attained a depth of 55 ft.—30 helow water level. It is to he continned to a depth of 100 ft. when levels will he rnn and stoping begun in earnest. The ore is hanled to the smelter as fast as taken from the mine. There is a compact body of ore fivs ft. in width. The walls are smooth, hard, and as well defined as could bs desired. There is no longer a douht that it is a true fissure vein. The work of development is carried on under the immediate supervision of Paris Gibson, Esq., who has the Barker honded, but for what sum I did not learn. The owners appear to think they have made a bad bargain, and in that I fnlly agree. Its location is so favorable for dsvelopment and permanent workings that it must always he a leading mine of the camp. Ore from the mine shipped to Omaha netted over $100 per ton. Tbis is certainly a good showing for a 20-ton lot not closely selected. In this connection it must be horne in mind that before starting on its long voyage down the mighty Missouri, it was hanlsd in wagons over 250 miles.

The Wright & Edwards

Stands next in point of development, though taking the amount of money spsnt upon it into consideration, it should have heen the first. Ths work has heen virtnally expended on the surface, hut in so many places and even nncovering large bodies of first-class ore, that it cannot he said to havs been expended in vain. Levels have been driven each way from a crosscut ahout 30 ft. heneath the surface, and a force of men are now engagsd in stoping. A tnnnel is hsing rnn that will cut the lode at a depth of 150 ft. This will he pushed forward rapidly, and the mine dsveloped systematically, as it is now in the hands of practical miners hacked with ahundance of working capital. This is the only incorporated mine in the district. It gives promise of heing among the lsading mines of Montana in a very hrief time. All the ore taken from the mine is delivered to the smelting company for reduction. The dnmp contains several hundred tons of ore, and it is believed that this mine, in conjunction with the Barker mill, can keep the smelter running constantly. A 30-ton lot of average ore from this mine, shipped to Omaha, netted $113 per ton.

Other Mines.

The Benton hss been opened by a 75-ft. tunnel rnnning along the vein. The wall rocks are well defined, and ths dump shows a large amonnt of low-grade ore. The ore shipped yielded about fi7 ozs. of silver per ton. There ars many others that show equally well for the amount of dsvelopment upon them. The most noteworthy of those that csme under my ohservation are Pittsburg, Keystone, Qnesn of the Hills, Vanderhilt, Silver Bell, Summit and De Soto and Meeks. There are hundreds of other locations, many of which will doubtless prove equally promising when hetter developed.

Svveral villages have aprnng up along Galena creek, and named as follows: Gold Run, Hughes City, Galena City, and Meagher City. Many houses are under way, and no doubt that ere one year elapses, they will all he thriving burgs or consolidated into one or two respectable sized villages. The present outlook for the Barker district is more encouraging than has been any other in Montana with the same development.

One Smelter has been Erected by

The Clendenning Mining and Smelting Co. The roasting furnacea and crushers have heen in operation for some weeks, and the hlast furnace will he started up about the 10th of January. The motive power is a 40-horss sngine with two boilsrs, only one of which will he nsed, the other kept in reserve for an emsrgency. The machinery consists of two Blake crnshers, one psir Cornish rolls, a No. 5 Baker blower, two roasting furnaces 47x12, and one water-jacket hlsst furnace. The building is a frame 65x110.

The process is that of roasting and reduction, the same as is in vogne in Freiherg and other parts of Europe, and extensivsly oopied in varions parts of the United States.

The works have heen erected under the immediate supervision of Prof. Foes, a gentleman who has had mnch experience in snch matters, having previously constrncted 11 similar to the one just completed, all of which have proved successful. The mschinery is of ths most approved style and most durable character. Prof. Foss will remain as a permanent fixtnre in manipulating the ores, etc.

The whole is nnder the general supervision of Col. George Clendenning, Jr., a thorough husiness man as wsll as a pnblic spirited and enterprising citizen. YEBREK.

Gold Run, Montana, Dec. 2fi, 1881.

Arizona.

EDITORS PRESS:—I am now some 70 miles north of Tucson, 40 east of Florence and ahout 40 southeast of Globe, at the jnnction of ths San Pedro with the Gila river. These rivers above here, are said to be unhsalthy; hnt right here, it is the healthiest plscs I bavs fonnd in Arizona. At Tucson, two autumns, I had a spell of chills and fever; here, no trouhle at all. I came into the neighborhood on acconnt of ths coal fields; and ths people wishing me to teach their school this winter, I cousented. I have had a tims of it. Ths Indian outhreak took place two weeks after I hegan, and scared most of the families away for three wesks. It was a rather unpleasant condition of things. I remained, hoping ths trouhls wonld soon end. There were a nnmher of miners stopped at the same place, and we carefully kept ten guns ready for defense at a moment's warning. Our mail carrier stopped his weekly visits at the time, and we could gst no news for so long that the suspense was dreadful. Then, when it was supposed all was orderly again, ths families retnrned, school hegan, and another outhreak occnrred. Terror seized the peopls again; and though thsy didn't leave this time, some did not come to school, whils those that did, carried deadly guns with them. It reminded me of the early history of Esstern settlements, where people carried their guns to church. Hsre ws fesrsd each day thst

The Redskins

Would come like a whirlwind and he upon us all of a sudden, when we intended to stand them off as well as we could.

As thers was a family and a numher of miners stopping there, a quarter of a mile from ths schoolhonse, and as they had made a fortification on a small hill nssr, we believed we could drive away 100, or more. But as the Indians are furnished with the most improved guns and abnndance of cartridges, we had reason to fear that some, or all of us, wonld hite the dust.

Oh, it does seem cruel that people must live in such terror of lswless savages, fattened at Government expense, furnished with the most deadly arms, and quartered nsar by ns hers, where, whensver they choose, they can make a sally, and carry death, destruction and ruin wherever they go.

I suppose every one of the 4,000 Indians at San Carlos reservation knows all about the condition of the families on the rivers from Florence up to Willcox, and heyond. Ths restless creatures, not satisfied to remain in idleness (and no wonder), have heen roaming all ovsr the country, sometimes over 50 passing at once, dnring the summer, before the trouhle.

What a blessing it would be to the Indians, as well as to the country, if all could he moved to the Indian Territory, where it seems to civilize them to sttle down and make homes. This part of the country most earnestly desires snch a thing as thsir removal, and the way it has heen, it would hs an immense saving to the Government.

A Valuable Country

Lies right in this neighborhood. I can show why. The soil on the river hottom is exceedingly fine, well adapted to grain, vsgetahles and fruit. Three of the neighbors havs gone into raising fruit—W. D. Herrington, W. A. Cnnningham, and, most extensively, W. A. Lattin, who has over 2,000 trees, apple, pear, plum, apricot, peach and other trees, and I must say that although I am, to a considerahle extent, a tree man, I never saw so fine a growth in any place I have been. His peach trees are planted 16 ft. apart, and although only three years old from planting, many of them nearly touch each other. I have been privileged to taste some of the peaches this year; and, again, I must say I believe them to be the finest I ever tasted. Crawford'a Late, in Los Angeles connty, Cal., was to me too *sour*; here, if anything, too *sweet*. The hot snn here seems to hring them to ahsolnte perfection, in size, beauty and flavor. Then, here are potatoes (Irish and sweet), corn, squashes, beans, onions, tomatoes, and everything nearly. Watermelons—oh! so large and so fine!

In addition to the value of the fine land lying along the river for cultivation, each farm has an immense range of fine pasturage for cattle among ths hills on each side of the river. Owing to the tremendous rains this summer, the grass has grown enormously, there being enough now for a thonsand to one of the numher hers at present. Of course the farmers on the rivsr are taking advantage of this, and increasing their stock as fast ss they can. The grass is of vsry excellent qnality, making flesh on the cattle, and the swsetest, richest milk. This place enahles one to rsvel in the bsst of vegetahles, milk, huttsr, sggs and ths lik; and soon the finest of fruit. Fruit trees are not old snough yet to bear ahundantly, for remember, it has heen but a few ysars since the dreaded Apache hindered any ons from venturing to rest his foot here, much more making a boms and planting trees.

Valuable Mines

Of gold, silvsr, copper and coal lie on each side of the rivers. Only 15 to 20 miles to ths east of us, ars the immenss heds of coal on Deer creek, some of them 10 ft. thick, and a very fine article for all purposes.

A copper mins, or mountain, as it may be called, a few miles up the Gila, and not far from the coal beds, was honded some time since for $200,000, I am told. Lately a ditch has heen taken out from the Gila just helow the month of the San Pedro, which is intended to rnn a qnartz mill. Now with smslters for copper, and perhaps for silver as well, with coal so near; with the famous Saddle mountain silver mines in sight; with other mines up south eight miles, from which two mules can draw down two of three tons; with a railroad in the near future, connecting the plscs with ths rest of the world; ons can ses, with his ayes shut, that this will bs a very important place when it is once uudsrstood that there is no fsar of Indians. What a mercy, therefore, to psopls who will live here, to have these merciless wretches removed, who do no good here, sven for themselves, and who are millions of dollars yearly a detriment to the country. H. H. MESSENGER.

Riverside, Pinal Co., A. T.

Fancy Mine Superintendents.

The following article, from the Reno *Journal*, is so timely and so just in its exposition of the mine management as it appears in Nevada, that it onght to he read carefully:

A mins is sold in soms Eastern city, money raised to prosecute developments and erect suitable machinery. Of course the first thing is the selection of a supsrintendent. In plscs of sending some careful business man who is interested in the propsrty out to ths mins, and have him employ a miner who hss learned the trade hy working at it, it is the custom to pick up soms pretty smart chap who happens to he out of employment, pay bim two or three times what a capahle man could hs got for on ths ground, furnish him with plenty of money and send him ont. Hs arrives at ths mine, and the first thing hs thinks of is to provide for his personal comforts. Hs huilds a handsome residence, furnishes it in style, purchases a nice huggy and fine pair of horses, hires a foreman and hookkeeper, and now he is ready for business. All this takes money, and in most mining districts a good deal of it. Thsre may not bs ore enough in sight to keep a five-stamp mill running, but this nice kid-gloved supsrintsndent does nothing hy halves—no little prospecting trip for him. So he goes to work and puts up anywhere from 20 to 40 stamps. Ws know of one instance in which a very large mill has been built at an enormous expense, and we have heen repeatedly told by miners from the district that when the job was commenced not a pound of ore had ever heen seen in the mine—in fact, all the mine thsre was consistsd of a hole ahont 15 ft. desp full of water. Of courss the mill is idle and likely to remain so. There ars mining operations going on in several plsces in this State under the direction of fancy supsrintendsnts that are standing jokes among the miners of the sections where they are heing done. Ths effect of this needless waste of money is to condemn mining as a legitimats bnsiness at the centers of capital. That there have been a large numher of worthless mines sold in the East; that millions of dollars have heen uselessly expended, is not the fanlt of ths mines; bnt for the wsnt of decent care in the purchass and decent management afterwards.

THE MCCRACKIN CO.—The Arizona *Democrat* says: Ths McCrackin Co. havs bought off the parties who jumped their gronnd, paying them $3,000 for their right and title. They have already put a force of men to work on the mine. Many of the old shafts and tunnels have caved in, and it will bs soms time before the property is in shaps for systematic working. So soon as the claim is in a condition for the extraction of ore, it is the intention of the company to start nn their mills. We have always considered the McCrackin one of the hest mines in the country, and there is no reason why, with careful and economical management, it should not be one of the best paying properties in Arizona. Its former failure was owing entirely to reckless and expensive manipulation. It is one of the largest ore hodiea in the Territory, easily reduced and with wood and water close at hand.

FRUE ORE CONCENTRATOR.—Of the many machines invented for the working of sulphuret ores the Frne is the most nsed. No other is in use in the Greenville district. It gives entire aatiafaction to all who have tried it here.—*Greenville, (Plumas Co.) Bulletin.*

Idle Mills in Arizona.

The Arizona *Democrat* says: A stranger visiting the mining camps of Yavapai for the first time, is struck with ths numher of idle mills and reduction works lying idle, which he encounters in nsarly every district in this county. He naturally inquires, why is it, that if our mines are as rich as ws claim them to hs, such a condition of things should exist. The question can hs more sasily asked than answersd; and the well-meaning attempts of eoms persons to mest the pertinent qnery, has not given satisfaction eithsr to the anxious inqnirsr, or to our own peopls. From a rssidence and experience of 10 years in the mines of northsrn Arizona, we shall attsmpt in this short article to show, why, and how, this state of affairs has besn hronght abont.

The first mining in this part of the Territory was altogether for gold. When ths rich surface deposits wers exhausted, ledges were located, and as depth was rsached, the free gold quartz changed to snlphurets. Eastsrn capital was snlisted to put up stamp mills to reduce these rehellious ores. Quartz mining was then in its infancy, and the ingenious and elahorate appliances for ore reduction of the present day were not known. As a consequence, the attempt to work hase ores hy the free milling process did not pan out vsry successfully. This was our first failurs. After the peaos with Indians, in 1875, mining received a frssh impulss in this county. But, unfortunatsly for us, the class of operators who came hither wers of the kind which any mining country can wsll sfford to do without. Possessing nsither honor, nor honesty, integrity or ahility, their only ohject was to feather their nests at ths expsnse of confiding frisnds on the "outsids," and guilelsss mine ownsrs hsre at home. They honded mines, erected mills, and after they msde a good "clean-np," departed snddenly for fresh fields and pastures new. Capitalists swore there was nothing in the country, while ths honest miner indulged in more original profanity ovsr the manner in which hs had heen hilked hy the unctious "expert."

The last count we shall alluds to, is that of failures caused hy our own mismsnagement and want of sense. Ths Peck and Senator will point our illnstration. Both of thsss fine properties should he paying to-day. But ignorant and stupid management has stopped ons, and litigation, brought on hy a lack of common sense, has cast a hlight over the othsr. Both are cases in point, where men had good things and didn't know it. Both remain as silent and impressivs monuments to idiocy and pure cussedness; to ignorance and gresd; to thick-headedness and downright dampboolery. It had heen said that that ths cause of ths stoppage of one of them was on account of litigation. Agrssing that it was, who first hegan this litigation and what caused it? Where did the legal fight first originate, and what was tbe germ of the trouhle which has etopped ons of the bsst mines in this Territory? Poor Bill Cols, who hss long mouldered in his silent grave, would bs a competent witness to answer if he could he reached through Dsath's eternal portals.

We have here alluded to the causes which havs retardsd our mineral dsvelopment.

Ignorance, mismanagement, rascality and fends among onrselves have heen the factors. We hops and trnst that our people will learn by experiencs, and that, with the hrighter day which is at hand, ws shall profit hy the mistakes of the past snd learn wisdom for the future. The next mining hoom in Yavapai promises to bs ths turning point in our history; if we ars wise we will avoid the rocks on which our past hopes were shattered.

MR. BENNETT'S NEW STEAM YACHT.—James Gordon Bennstt's new iron steam yacht wae launched the other day at Newbsrg-on-the-Hudson. There was no christening ceremony, a cable dispatch from Mr. Beunstt having heen received to the effect that he had not yet found a suitahle name for her. The yacht is 237 ft. over all, 26 ft. heam, and 18 ft. deep. She is to be rigged as a three-masted schoonsr, with pole topmasts. Her bunkers will contain 150 tons of coal. The propsller shaft is 11 inches in diameter, and the propeller 15 ft. fi inches, with 18 ft. pitch, which is calculated to give her a speed of 14 knots per honr. The interior fittings will bs most magnificent, ths cabins and saloons being forward of the engines, and the qnarters for ths officers and crew abaft. There are nine state-rooms forward, besides Mr. Bennett's room, and a ladies' cabin forward of the main saloon. It will tske about thres months to finish her. She is the largest yacht that has ever bsen bnilt in this country, with the exception of one built at Baltimore last year for M. Henri Say, of France.

OVER ONE MILLION DOLLARS.—A letter from Capt. Guyer, Superintendent of the Custer mill, says: "We have just molded our last bar for 1881, which foots up $1,002,183.18 taken out since Feb. 1, 1881, 11 months' run. The mill is in splendid condition." The letter was addressed to George M. Parsons, Esq., of this city. The above showing is enough to convince the doubting Thomasea of the sort of mineral property that ia to be found on Wood river and its tribntaries.

THERE is a good deal of travel to and from all the Eastern towns and mining camps over the Carson and Colorado. Persons passing over the ronte are loud in their praise of the road as one of the smoothest running in the country.

MECHANICAL PROGRESS.

The American Locomotive.

John Roach, the eminent American ship builder, in a recent address before the late New York Tariff Convention, said: "Now, I want to call your attention briefly to what we have done in building the locomotive. That will show the development of another American industry. Fifty years ago, we imported a locomotive engine from England, as a sample. I made an examination some time since as to the number of locomotives now in the United States, the cost of their construction, and how it compares with the cost of construction in other countries. The number of locomotives in use in this country Jan. 1, 1879, was estimated at 16,445, valued at $164,450,000. The number of cars in use, not including palace cars, was estimated low at 498,000, which would cost at least $600,000,000, making the value of locomotives and cars together $764,450,000. Besides, as much as one-tenth of the total now running must have been rebuilt, say five times, since 1830, at a cost of $382,225,000, making a grand total of $1,146,675,000, which is more than England has invested in ships. But besides this, we have built locomotives for export to all parts of the world, owing to the recognized superiority of the American locomotive.

"The Baldwin Locomotive Works alone sent out of the country from 1870 to 1880 over 520 locomotives, 152 of them to English colonies; and of all the locomotives used in the English colonies from 95% to 98% were built in the United States.

"The United States have exported since 1870 $20,000,000 worth of locomotives and double that amount of cars.

"We have been succeeded in building locomotives of such quality and at such prices that we have taken England's locomotive business away from her in her own colonies. Is there any reason why, when our ship building shall be equally encouraged and developed by extending our trade and making a demand for it, we should not build ships for those countries which have not the resources to build them for themselves?

"But then we are told that while we can build the locomotive and car we cannot build the ship, though that is built out of the same material and from the same forest and mine, and though the labor required to convert 100 tons of pig iron into locomotives is much greater than it is in the finished ship and just as high priced. But we had a policy for building the locomotive, by finding a use for it, and you see the result."

How Closely Does a Machinist Measure?

In connection with the question of standard gauges and measuring instruments of perfection, it is interesting to notice how closely the machinist works with the *ordinary* tools of his trade.

Some little observation of a workman engaged in boring locomotive driving wheels and fitting shafts to them, led to the following:

The wheels were bored with a tool, and of a taper of 1.64″ in 7″. They were bored in a remarkably good lathe, but not to *exactly* the same size. A certain distance was fixed upon as proper for the wheel to be forced on the shaft, after allowing the shaft to settle into the wheel (which was laid down on the floor) by its own weight, and the workman would not make a variation of more than $\frac{1}{32}$″ in that distance.

Making allowance for want of truth in the hole and shaft (although it was extremely difficult to detect any variation), it is safe to say that the machinist was working within 1-4000th of an inch. To do this, he must first measure the hole in the wheel with his caliper, transfer that measure to another pair of calipers, and again transfer that measure to the shaft he was turning. Making allowance for the fact that a machinist cannot turn as fine as he can measure, it may be safely concluded that he will work so closely, that the variation will be scarcely noticeable in a fit. However closely he may work, the fact should not be lost sight of, that he cannot define the size to which he is working, without the use of some sort of a measuring instrument of perfection. In other words, he can work almost infinitely closer than he can measure, by the use of ordinary tools.—*American Machinist.*

A FRENCH EXPERIMENT IN SHIP-BUILDING.—During the French blockade by the English fleet, Napoleon established a maritime arsenal in Venice, where a number of vessels were built. One day a brig, upon which great expectations had been founded, left the port without having time for trial; but it sailed so slowly that it was captured by an English ship before it reached the open sea. The French crew was replaced by an English crew, which was soon disappointed at finding that it was almost impossible to move the brig. Upon examination it was suspected that the principal mast had been badly stepped. Carpenters were called, who gave the mast a greater inclination, and after spreading the sails anew, the brig was found to be a faster sailer than any other in the English fleet.—*Les Mondes.*

The Position of the Skilled Mechanic.

No matter to what extent the refinement in machine tools may be carried, it is in the end the careful and painstaking operation of the skilled mechanic that must bring the products of these tools to a perfection that will meet the requirements of modern demands. The lathe will not turn so round that, in this respect, its production cannot be improved by the hand-work of the skilled machinist, nor will the milling or planing machine produce surfaces so true that he is not called upon to rectify them with the file and scraper. Now, as ever, the beautiful finish on iron and steel is the result of the individual effort of the operator, rather than of the perfection of tools.

Years ago the opinion prevailed to a considerable extent, that the services of the highly skilled mechanic would not be so much a matter of necessity in the future as in the past, but those who built on such grounds built poorly. The man will always be superior to the machine, and must always see better than he can perform.

One man may direct the efforts of 50 skilled workmen to the production of good work, but 50 men cannot get good work from one unskilled workmen. Improved tools and mechanical appliances will simply assist the artisan in the production of fine work, but the greater the refinements of these tools and appliances, the greater must be his skill. Instead of relieving him of his responsibilities, which would be in every sense a misfortune, they add to them, which makes him, in every way, the better, in being able to meet them.

Altogether, the position of the skilled mechanic is in every way satisfactory, in its relation to improved machine production, and the tools and appliances of the future, however refined, can never usurp the place in the industries of the world, nor relieve him of the part he is to play in future mechanical advancement.

SILK VS. FELT FOR COVERING BOILERS.—It is well-known that silk is an excellent non-conductor of heat, and some recent experiments in Germany would seem to indicate that it might pay to encase boilers in this costly material. In one trial three boilers of the same size and make were ranged in order, one covered with the ordinary felt, another with a coating of silk only five-eighths of the thickness of the felt, while the third was left altogether uncovered. They were all filled with water having a temperature of 100° C., and examined at intervals. After a lapse of three hours it was found that the unprotected boiler had lost 12° of heat, and the other two each 2°. After a further lapse of 33 hours, the felt-covered boiler had lost 13½°, and that covered with silk only 14°, so that there was no appreciable difference between the protective powers of the silk and those of a casing of felt nearly twice its thickness. With regard to the cost of the material, it is said that in all the silk manufactories there are waste-scraps which it would be difficult or impossible to utilize in the trade. These can, it is asserted, be made up into bands and rolls, costing comparatively little, and sold at a profit to the makers and users of boilers. As to the lasting and wearing powers of silk as compared with felt nothing is said, and there has not, perhaps, been time to apply an adequate test; but it is at least possible that in this respect the finer substance may possess great advantages over the coarser and cheaper.

THE BEST CEMENT FOR LEATHER.—We have known $10 or more to be paid for a recipe for mending belts, similar, but not equal to this, which we clip from the *English Mechanic and World of Science:* "For making cement for leather belts, take of common glue and American isinglass equal parts, and place in a glue pot. Add water to cover the whole. Soak ten hours. Then bring the mixture to a boiling heat, and add pure tannin, till the whole becomes ropy or like the white of an egg. Apply warm. Buff off the grain of the leather where it is to be cemented; rub the joint surfaces solidly together; let it dry a few hours, and it is ready for use. If properly put together no rivets will be needed, as the cement is as strong as the leather."

SINGULAR MECHANICAL PHENOMENON.—Mr. Joshua Rose, in a recent issue of the *Mechanical Engineer*, says: "Sometimes a circular saw that has just been tempered and laid down to cool will commence to hum, and if it is not quickly replaced in the furnace it will crack. The humming begins in a low musical key, and rises in tone until it ends in a snap. The saw does not always crack through from the eye to the perimeter, and it never does so if it is got into the furnace while humming in a low tone. If the crack proceeds but a part of the way, it is from the bottom of a tooth or space and toward the eye. Saw makers are unable to explain the cause of this singular fact, which is a very costly one to them."

POROUS BRICKS.—The association of proprietors of steam engines in the north of France have made numerous experiments which show that many of the bricks that are employed in building furnaces are so porous as to allow an easy passage for the air. In consequence of these experiments they advise that no bricks should be employed for the purpose which are not very compact and refractory, and that they should be either glazed upon the outside or covered with an impenetrable varnish.—*Chron. Industr.*

SCIENTIFIC PROGRESS.

Nitrate Deposits.

The Chili nitrates, the real cause of the late "unpleasantness" between Chili and Peru—nitrate of soda—is found in great abundance on the desert of Atacama, a short stretch of country lying just north of Chili and on the extreme southern coast of Peru. These nitrates, are generally covered, first, by a bed of soil, varying in thickness from 4 to 10 inches, next by a compact layer of gypsum, immediately under which the nitrate occurs in irregular beds, from 2 or 3 to sometimes 8 or 10 ft. in thickness, and is found over an area of some 40 square leagues. It is often mixed with sulphate of soda. There is also another large deposit found at the Pampa del Tamaruagol, where it does not occur nearer to the coast than 18 miles. It appears to have been gradually transposed to salt as it approaches the ocean. It seems to have come from the decomposition of the felspathic rocks which form the central portion of the desert to the eastward of the nitre beds.

Nitrate of soda is artificially prepared by neutralizing nitric acid with soda and crystallizing the solution. It consists when dry of 36.6 soda, 63.4 of nitric acid. The contained water of chrystallization amounts to 9.47 of the combined substance.

The natural nitrates are refined by being broken into small pieces and dissolved in boiling water, when the earthy and insoluble matters fall to the bottom. The clear liquor is run into shallow troughs; where, being exposed to a tropical sun, it soon crystallizes. There are about 100 of these refineries scattered about over the nitrate territory.

The existence of this deposit was first practically brought to the attention of the world in 1820, when a small lot was shipped to England; but the duties on it were so high that the then known use to which it could be put would not allow of its being landed, and it was thrown overboard. Several other unsuccessful efforts were made within the next eight years to introduce it into England, France and the United States; and it was not until 1830-31 that it began to have a merchantable value. The latter year, it was sold in both England and France for from $150 to $200 per ton. It is used with other mixtures as a fertilizer of land, and for the manufacture of nitric acid. It is susceptible of all the applications for which niter is used, except for the manufacture of gunpowder, for which it is not adapted, in consequence of its deliquescent property. In its refined state, it often contains a small quantity of iron, and always a trace of iodine; also, common salt, sulphate and carbonate of soda, muriate of lime, and occasionally borate of lime. There are some four or five, mostly slightly different varieties, one of which—the most variable—composed of boracic acid, 49.5; soda, 8.8; water, 26.0; lime, 15.7=100, it is thought might be profitably utilized in the manufacture of glass.

ACTION OF COLD UPON THE VOLTAIC ARC.—D. Tommasi publishes the following conclusions from his experiments: When the voltaic arc springs between two metallic rheophores, each formed by a U-shaped tube, traversed by a rapid current of cold water, and placed horizontally near to each other, the following facts are observed: 1. The illuminating power of the arc is greatly weakened, being reduced to a simple luminous point even when a very intense electric current is employed. 2. The arc, if it can be called so, is very unstable; the least breath extinguishes it, and it cannot even light a match without being extinguished itself. 3. If a piece of paper is placed above the arc, and very near it, a black point is formed, which spreads and finally breaks, but the paper does not kindle. 4. The arc consists of a luminous globule, moving up and down between the two rheophores; the form of the globule as well as its extreme mobility reminds one of a drop of liquid in the spheroidal state. 5. If the south pole of a magnetized bar approaches the arc, it is attracted by the magnet and extinguished. The same fact is observed, but in the opposite direction, upon the approach of the north pole. 6. The quantity of ozone seems to be greater than when the arc is not cooled. In spite of the cooling of the rheophores, the flame is slightly green, which shows that a portion of the copper is burnt. Tommasi proposes to experiment with platinum rheophores, with alcohol cooled to 22° F.—*Comptes Rendus.*

GIGANTIC ALGÆ.—The Madras *Mail* contains an account, Capt. Taylor, of an enormous monster which he saw while at anchor in Table bay. It was more than 100 ft. in length, and appeared to glide over the water with an undulatory motion, like a serpent. Its head seemed to be surmounted by something like a long mane, and the observers who had the sharpest sight affirmed with fear that they could distinguish its features, and even its eyes. He collected the crew and directed a brisk fire of musketry upon the monster, at a distance of about 500 yards. When it seemed to have been seriously injured, and its movements were a little quieted, boats were sent out to examine it more closely and to finish its destruction. It was then found that they had been fighting a magnificent specimen of the giant herb of the sea, of which the undulatory motions were caused by the agitation of the waves near the shore.—*Les Mondes.*

Telephone Conductors.

In view of the fact that the postoffice authorities of London are contemplating laying all their telegraphic wires underground, it is interesting to know that an important economy in their cost, and in the space occupied by them, has recently been effected by Mr. Edwin Truman, of London, England. The invention has special reference to telephone conductors. It is now well known that to employ telephones with a good result, the earth must not be used for the return current, but that two wires must be employed, the one to send the current and the other for the return. To insure perfect freedom from induction, these two wires should be perfectly insulated and be equi-distant from all surrounding matter. In order to effect this, they must be twisted spirally on each other, so that each alternately takes the place of the other. This necessitates the use of two wires, and, of course, involves the cost of two, plus the twisting. Hence a difficulty, which, however, has been ingeniously overcome by Mr. Truman, who places the two wires in one covering, and keeps them apart and well insulated from each other, and yet arranges them spirally to each other. Considerable economy is thereby effected, firstly, in the materials used; and, secondly, in the space occupied, which is a most important item in underground work. Some of Mr. Truman's wire contains six separate conductors, insulated from each other by about 6,000,000,000 of units, and the entire six insulated from the surrounding water by the incredible quantity of 13,470,000,000 of units per statute mile. The core is of solid guttapercha of the highest quality, and its diameter is about equal to two of the present underground wires. This gives a core of the quality of which there can be no doubt, as guttapercha has stood the test of time in telegraphy. The saving to the public, moreover, will be great, as Mr. Truman states that he can make cables of any reasonable number of wires, and produce the same result, at a saving of at least one-fourth of the present cost.

THE MOVEMENT OF GLACIERS.—Messrs. Koch and Klocke made a series of measurements about one year ago to determine the rate and character of the movement of glaciers, using essentially the same methods employed in a previous series of observations conducted in 1879. Their first observations seemed to prove a considerable and unexpected degree of irregularity in the movement. It was found, for example, that the same point could have a motion in both a vertical and horizontal direction, and that two points not very far apart in some cases moved at a different rate, or even in opposite directions. The observations of 1880 have, on the whole, given a rather negative result, since, for some unknown reason, the motions measured were much smaller than before, those in a vertical direction, for example, hardly exceeding the unavoidable errors of observations. Messrs. Koch and Klocke concluded that the amount of observed movement, vertical and horizontal, often did not exceed the probable error, and hence their results do not allow of satisfactory discussion, but they, notwithstanding, indicate real ice movements, and are not to be wholly referred to irregularities in the position of the observing telescope.

TRANSFORMATION OF SOUND INTO LIGHT.—In 1879, a year before the invention of the photophone, M. Treve made an experiment which is the reverse of the photophone. A Fizeau condenser, consisting of sheets of paper alternating with tinfoil, was rolled and placed in a Geieeler tube, which was connected with an air pump. The current of a Ruhmkorff coil was passed into the tube, and a telephone was placed in the induced current. While the current was passing, the roaring of the electricity in the condenser could be heard in the telephone. If the pressure of the air in the tube was gradually diminished by the air pump, the roaring subsided; when a vacuum of two or three millimetere (.079 to .118 inches) was reached, the noise ceased altogether, and light began to play against the leaves of the condenser. It was not the well-known vague and diffuse light of the Geissler tubes, but a special, condensed, pearly radiance. It was necessary that the electricity should be manifested in some way, and as it could not be transformed into sound, on account of the rarefaction of the air, it was changed into light.—*Les Mondes.*

INFLUENCE OF TELEGRAPH WIRES UPON BIRDS. In the neighborhood of the pine forests of Norway the telegraph posts which have been freshly impregnated with sulphate of copper are often found to be entirely perforated by the woodpeckers. The resonance, which is produced by the vibrations of the wires, leads the bird to suppose that there are worms and insects in the interior, and holes are consequently made which are sometimes as large as a man's arm. They are generally found near the insulators.—*La Nature.*

DIFFUSION OF ELECTRIC LIGHT.—M. Clemandot was induced, by observing the diffusion of the solar light by clouds, to experiment with mineral wool, or spun slag, in connection with the electric arc, and found that it seemed to absorb the light like a sponge, so as to make from 75% to 80% available for illumination, while the ordinary processes utilize only from 45% to 50% at the most.—*La Nature*

Casualties with Explosives Reported During Last Year.

[Collated from reports in the daily press.]

January

16. Ashen, Col.—Ons man killed hy explosion of dynamite.

18. Bradford, Pa.—Employee of Roberts' Torpedo company torn to pieces hy explosion of 4 lbs. of nitro glycerine; had it in a can, when hs slipped and fell.

March.

4. Eureka Powder Works, near Berkelsy, Cal.—Explosion of works, causing death of 3 msn and serious injury of S.

April.

2. Wilkesharre, Pa.—One man killsd and one injured hy explosion of a dynamits cartridge; heavy loss of property.

11. Thunder Powder Works—Explosion at Thunder Powdsr works, near Melrose, Cal., foreman of works maimed and building shattered.

18. Tonite Cap Factory, near Berkeley, Cal.—One Chinaman killed in making fulminats of mercury.

21. Union Metallic Cartridge Co., Bridgeport, Conn.—1,000 kegs powder in magazine; large damage to property.

21. Dittmar Powder Works, near Binghamton, N. Y.—Explosion of works; heavy loss to property.

May.

28. Martin Whits tunuel, Ward, Nev.—Minsr suffocated and rendered nnconscious hy Giant powder fumes; whils in this condition two charges sxploded near him; hs was rescued more dead than alive.

31. Dalles, Oregon—Two men killed and one injured hy premature explosion of giant powder.

June.

2. Leadvills, Colorado—Two children hadly injured hy explosion of Giant powder cartridge.

7. Utah, Pascoe's Quarry—Heywood, agent of Thunder Powder Co., frightfully injured hy ramming a cartridge of Thunder powder into a hors-hole.

10. Bechtel mins, Bodis, Cal.—Ons man killed hy explosion of Giant powder cartridge.

13. Westchester, N. Y.—One man killed and one shockingly mutilated hy explosion of nitroglycerine.

27. Clark's Landing, Alameda Co. — Alta Chemical Co., manufacturing chlorate potash explosive; works burned; thres men injured.

27. Tucson, Arizona—Powder magazine containing Giant, Hercules and Vulcan, Tonite, black and sporting powders. Great damags to property.

July.

10. Cherry Creek, Nevada—One man killed and one injured by explosion of Giant powder cartridges, at Star mine.

August.

26. Warrsn, Maine—Powder mill exploded; one man killed.

October.

9. Portland, Oregon—Man had part of arm blown off cutting a Giant powder cartridgs with a knife.

9. Council Bluffs, Ia.—Fearful explosion of a carload of Giant powder, causing great damage to railroad and other property. Loss reached about $500,000.

13. Bradford Pa.—Magazine of Rohert's Torpedo Co., containing 300 lbs. nitro-glycerine exploded; two men seen ahout before explosion; disappeared.

21. Moore's Flat, Cal., Wo Yen tunnnel—Blast of No. 2 Giant powder sst off in the evening, and no attempt was mads to enter the tunnel again until the following morning; of the men entering, 3 were taken out dead and 18 insensible from the effect of the fumes still remaining.

November.

8. Lake Superior—Explosion of 400 lbs powder at Quincy mine; mine hadly wrecked; thres men killed.

19. Great Sierra mine, Tioga District—One man fatally, and two seriously injured by thawing frozen dynamite powder; Excelsior powder.

22. Ventner, Idaho—Ons man killed thawing Giant powder.

24. Victoria, B. C.—Ons man killed and two seriously injured hy premature explosion of Giant powdsr.

22. New York City—Seventy-third street; fearful explosion in thawing dynamite; eight persons injured and heavy loss to property.

24. Greenwich, Conn.—Five men killed hy prematurs sxplosion of Giant powder, and three injured.

26. Lundy, Mono Co., Cal.—Two men injured at Nioma mine hy sxplosion of Giant powd r.

December.

3. Virginia City, Nev.—One man killed and one seriously injured hy explosion of Giant powder at Forman shaft, caused by drilling into an unexploded cartridgs.

5. Bradford, Pa.—Nitro-glycerins magazins, helonging to Roherts' Torpedo company, containing half a ton, found fuming from spontaneous comhustion and left to hlow up.

16. Washingtonville, N. J., railway station of New York, Susquehanna and Western railroad—Totally destroyed hy explosion of Giant powder.

19. Mount Union, Pa.—A whole family of six persons killed in thawiug dynamite.

31. Wampum, Pa.—Two men seriously and two fatally wounded hy thawing dynamite.

Mining Share Market.

There is nothing much doing in the "Share Market," as onr quotations show.

Thens ws from ths Comstock is interesting, as showing that ths workings in several of the mines are approaching important points. Following is the dispatch:

VIRGINIA (Nev.), Jan. 25. — Crosscntting from the south drift No. 2, on the 2700 level of Union, will he commenced about next Saturday.

MINING SHAREHOLDERS' DIRECTORY.

Compiled every Thursday from Advertisements in Mining and Scientific Press and other S. F. Journals

MINING SUMMARY.

This following is mostly condensed from journals published in tbs interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

THE JOHN BULL CLAIM.—Ws are pleased to learn that a very rich strike has recently been made in the John Bull mins, about 3 miles southwest from Jackson, and that the present indications are that it will prove one of the richest mines in this locality when thoroughly developed. This mine was formerly known as the Anderson mine, it having been discovered by Mr. W. G. Anderson; but it is now owned by Messrs. Matson, Pleming & Carter.

MISCELLANEOUS.—Thare has been no ors found as yet in the east and north drifts at the Con. Amador. They have commenced a new drift from the 1000 level south. The Mahoney M. Co. paid off their employes on Tuesday of this week. The mine is looking better at present than ever before and promises to rank among the best paying mines in the State. Supt. Davies expects to commence crushing ore with the new mill at the Seaton mine this week. Knight & Co sent one of their large water-powor wheels to the Pacific mine at Plymouth this week.

NABOB.—Amador *Ledger*, Jan. 21: This quartz claim, situated above Hanley's ranch, near Pine Grove, and formerly owned by Vandament Bros., has lately been purchased by a San Francisco company. Work is being prosecuted on a small scale under the superintendency of Mr. White. The prospects for a paying mine are said to be good. The shaft is down over 30 ft, with a quartz ledge 3 ft in width. The ore is of good quality, judging from appearance. Free gold is often seen. Some 20 tons of rock are on the dump. Should the ore body continue as at present, the owners will probably put up a small mill during the coming spring.

BUTTE.

LAVA BEDS.—Oroville *Mercury*, Jan. 21: Mining in the vicinity of the Lava Beds is being carried on to a much greater extent this winter than for a number of years past. The ground has to be stripped to a depth of from 5 to 16 ft, and usually these holes are so full of water that the Chinamen are forced to leave them. This winter the case is different, for, there being but little rain, they are not molested, and are taking out a large amount of gold dust. About $10,000 worth is taken to the Mint from these mines every month.

CHINESE MINERS.—When the Miocene mine was closed by an injunction, the Oroville M. Co. also ebut down work on their claim, in which J. B. Hewitt and ex-Governor Low are the chief owners, no doubt fearing that they would be the next to be visited by an injunction. A few days since the entire mining claim was leased to 3 companies of Chinamen for a term of 6 years, for a large sum, and now the Chinamen are as thick as bees all over the claim, with pan, pick, shovel and rocker. They are to mine 30 feet deeper than the present bed of the mine, but are not to let any of the dirt find its way into Feather river or any of its tributaries. Tbis claim is rich, and there was much rivalry between the Chinese companies as to which should get it.

CALAVERAS.

HYDRAULIC MINES.—Calaveras *Chronicle*, Jan. 20: As soon as the water supply had increased sufficiently to enable work to be commenced in the hydraulic mines in this vicinity, the season was opened with active operations all along the line. The freezing weather for the past 10 days has been a serious drawback to hydraulic mining, tbe water supply being so reduced that all the mines were shut down, during which period the time was occupied in fitting up.

DURYEA HYDRAULIC.—At present the work of running off surface ground is being done as fast as the water supply will permit. It is the purpose to uncover a large extent of bottom gravel during the winter, and to run off the bedrock gravel later in the season. All that is necessary to prosecute the work vigorously is a good supply of water.

MAMMOTH HYDRAULIC.—John Vieth, Esq., of the Mammoth mine, has everything in excellent condition to complete a profitable season's run. The gravel in this claim is very much cemented, requiring blasting, which will be done at once

PENOBSCOT MINE.—Mr. George Emersou, of the Penobscot mine, is industriously engaged in removing large rocks preparatory to running water again. The past summer a bedrock tunnel was run, giving more grade, which improves the working facilities of the mine greatly. The indications for a good cleanup are certainly most flattering.

BONANZA HYDRAULIC.—We found Mr. Moser at the Bonanza with pan in hand engaged in making a cleanup, which, judging by his smiles and good humor, sustains the reputation of the famous "Bonanza." If the gravel mines of this section were located in any of the northern counties, more satisfactory results would be obtained. Our water supply being limited is one serious drawback, and the Chili gulch mines are so incumbered with tailings that the grade is too small to work on a northern county scale. All thie would easily be obviated with the proper expenditure of capital, and pay good dividends to the investora.

EUREKA AND PINE PEAK MINES.—The Cook Bros. are diligently prosecuting work at their Eureka and Pine Peak mines. The Eureka, managed by Mr. Aaron Cook, has a large supply of free water, supplied by their two ditches, the Eureka, 12 miles in length, conveying water from Esperanza creek and Calaveras river to the mine, and the Calaveras ditch, 6 miles in length, conveying water from Jesus Maria creek to the claim. With an ordinary water season, a large scope of country will be washed off, which will insuro the owners a much larger dividend than was realized last year. Work was suspended a few days on account of the freezing weather, but all is running again like clock-work. Mr. Wm. Cook is managing the Pine Peak claim, which he has fitted up in good shape with a water supply from the Mokelumne hill ditch. The gravel bank is a ridge 60 ft in depth, is free from cement, and prospects well. The Cooks, with their industry and experience, will make the Pine Peak one of the best hydraulic properties in the county.

LAMPHEAR MINE.—The work of pumping out the water in the Lamphear mine was commenced last Tuesday. The energetic, business-like manner in which operations have been pushed reflects great credit upon the efficient superintendent, Mr. H. F. Lambert.

INYO.

PANAMINT.—According to A. W. Robinson, who lately brought some $2,000 in silver from Surprise canyon into Darwin, there are about 60 miners at work in Panamint, extracting ore for Pinney's much abused and blackmailed "Eastern company." The big mill is steadily pounding out bullion, and we are glad that New Yorkers get the dividend benefits.

ISLE.—The Lookout country is idle, the late lessee of the Modock being in San Francisco. The Snow Canyon and Minnesota works, in the same district, and adjacent, are also quiescent. Lee district, just this side of Darwin, with its fine mill, is in the hands of San Francisco Micawbers, waiting for "something to turn up."

DARWIN.—Inyo *Independent*, Jan. 21: From Billy Lake, who visited Darwin a day or two ago, we learn that the present business and future outlook is much hetter than for years past. Messrs. Reddy & Gorman have some 25 or 30 men employed in the Defiance and Custer mines, both of which are looking better, if possible, than ever. Twenty tons of bard ore is being delivered at the furnace daily, there being now about 1,000 tons at the stacks, with 20,000 bushels of coal already delivered. Both the Defiance furnaces will be fired up on the 25th, requiring altogether about 60 men to keep them going. The late cold weather has delayed much necessary outside work, preparatory to the proposed long run; otherwise the bullion output would have begun before this.

KEYNOT.—Superintendents O. G. Fuentes and Peter

Taylor, of the Keynot mine and the Taylor and McEvoy mill, respectively, are now in Beveridge district taking a new look at things generally. They are accompanied this time by H. H. Scott, a prominent San Francisco stock broker. It would rather look as though the Keynot owners have already lost too much valuable time in truckling to possible San Francisco purchasers of their rich mine. At least two-thirds of the money they ask for it could have been taken out in the meanwhile.

LOS ANGELES.

SILVERADO MINES.—Santa Ana *Standard*, Jan. 20: Thos. Harvey and E. A. Edwards, of Los Angeles, both old prospectors, came in from a trip, last Tuesday, to the Silverado mines, situated about 18 miles east from this place. Mr Harvey reports that the snow now lies there to the depth of 18 inches. The late storm was the severest ever known. Very little is being done upon the mines at present, but arrangements are being perfected to push work upon the New York Company's mines, and on the Dunlapp mine at an early day. The mines there —more properly the Santa Rosa mining district—have a good reputation, and it is believed that the work to be prosecuted upon them this season will result in causing the district to attract considerable attention. The character of the ores in this district are both free-milling and smelting. There is plenty of water and considerable wood, and the Santa Clara coal mine, owned by the Southern Pacific Railroad Co., is distant only four miles. Whether this coal is of a quality to produce coke we have not learned. If it will, then furnaces could be run in that district more cheaply than in any other we know of.

MONO.

BODIE.—*Free Press*, Jan. 24: The principle feature of last week was the advance in Bodie and Mono stocks. Much speculation was indulged in as to the cause of the movement, the stock sharps in San Francisco generally considering its a speculative advance. The facts are that the advance was caused entirely by orders from Bodie for these stocks, and the subsequent decline occurred when these orders were filled. These orders were doubtless based on the cutting on the 18th of a rich vein, or seam as it is modestly termed in superintendent Whiting's report, in a west crosscut from winze No. 9, below the 6th incline level. The vein is about 6 inches wide, and very rich. It widens on drifting south. The recent discouraging reports in regard to Bodie are by no means justified by the facts. There is a 6 week's supply of ore at the mill, and many months—and doubtless years—supply in the mine. There is no change reported in the Standard, and work has not been resumed in the shaft. The flow of water in the Red Cloud shaft has decreased in volume, and it is thought work will be resumed in the bottom shortly. The Oro shaft is down 686 ft. The next level in this mine will be run at 720 ft, and as a back of 200 ft will have been gained, the prospects of such a concentration of ore as to make a veritable bonanza, are very good. The Goodshaw will commence to crosscut during the present week at a depth of 750 ft. The Bodie tunnel mill is nearly ready to commence crushing, and the Miner's mill has already commenced on Boston Con. rock. Prospecting on the 982 level of the Tioga continues, with encouraging results. No difficulty is experienced in keeping the Noonday mill supplied with ore, which may also be said of the Syndicate. To sum up the situation, it can safely be said that there is more reason to be encouraged as to the general appearance of the district than for many months past. Those who have sufficient faith to stay with their stocks will yet receive their reward.

NEVADA.

OCEAN STAR MINE.—*Transcript*, Jan. 21: Supt. Searing of the Ocean Star mine, 3½ miles above Washington, was in town yesterday. The property he is in charge of is owned by Chicago capitalists who are conducting it as a private business enterprise, no stock being for sale. They put down a shaft and extracted about 300 tons of very good looking ore. Upon reaching a depth of 50 ft the water came in so fast that they abandoned the idea of sinking further and concluded to run a tunnel which will be less expensive and more effective than working through a shaft. The tunnel will be pushed through as rapidly as possible to the ledge which will be reached within a distance of 180 ft. The company's new ten-stamp mill will be finished in 3 weeks and the stamps will then begin dropping. Supt. Searing says that the mine will pay if the ore yields $5 a ton, so large is the ledge.

RICH SPECIMEN ORE.—Nevada *Transcript*, Jan. 22: Some specimens of ore that will pay at the rate of $20,000 or more a ton were found night before last on the 350-ft level, north of the Nevada City mine. These exceedingly rich bunches are frequently encountered in that part of the mine where the ledge varies from 1 to 4 ft in thickness. The water is now all out of the workings and the incline is down 90 ft towards the 450 level which will be started this week.

THE DERBEC DEVELOPMENT.—A few days since we published as a rumor the statement that a rich strike had been made in the Derbec drift mine. Subsequently the rumor has been verified by a gentleman who came down from North Bloomfield on Friday. He says that a 12 ft deposit of gravel paying from 25 cents to $1 a car has been found in the east drift from the new shaft. In addition to this, No. 11 from the old shaft, which has been running through barren ground, came into good gravel a few days since.

SAN BERNARDINO.

THE PROVIDENCE MOUNTAIN MINES.—San Bernardino *Times*: Little has been said regarding the mining interest of the Providence mountain mines. J. B. Cook, who has had charge of the mines owned by Messrs. Osborne, Hasson, Boyer and Drew, arrived here a few days ago, and we glean a few facts as to the workings of Trojan mining district, Providence mountain, from him. It appears that there have been from 20 to 50 men working on what is known as the Bonanza King and Rattler mines for the past 6 months, and large developments made. The deposits are gaining strength with the developments made; there is now showing in the lower workings over 400 linear ft of large mineral deposits. So far they have not stoped any ground, and all the ore on the dump is taken out of shafts and drifts, of which over 1,000 ft have been run; besides, they have had a large quantity of ore shipped and worked, which has averaged over $700 per ton. They are now having teams loaded back with ore assaying over $750 per ton. This is done no doubt to get freighters more readily. These mines have been self-sustaining since the first day they were struck by Messrs. Hasson and Andrew McFarlane. There is now at the very closest estimate over $150,000 assay value on the dumps, and within all reason 10 times as much in sight in the mines. The mines are in limestone, with a porphyry contact to the east.

SAN DIEGO.

JULIAN.—San Diego *Union*, Jan. 10: Mr. J. S. Buck, of Julian, called on us last evening. He informs us that there is considerable excitement up there over a recent strike by the Wilcox boys in the St. Valentine mine. They are are said to have opened a ledge of $20-quartz two ft wide.

SHASTA.

ARASTRAS.—Shasta *Courier*, Jan. 21: There are a number of arastras and one mill operating in Deadwood district, on the line of Trinity and Shasta counties, and we are informed that additional machinery is to be put up in the spring. The mines are paying splendidly. A 60 ft tunnel run in on the west side of the Lost Confidence mine at Iron mountain, just 1 mile from where the main tunnel and shaft was started, reveals the same quartz and mineral found in the principal works.

QUARTZ.—There is a big excitement about quartz at the head of Hickey gulch, near Middletown. An old prospector and pioneer miner, by the name of Laurie, who has been absent from this county for years, but knew of the richness of the ledge, returned here some days ago and located claims on a quartz lode extending from the head of the gulch mentioned to Sugar Loaf mountain. The croppings from the lodge show an abundance of free gold, and will pay good wages to pound up in hand mortars.

SIERRA.

NUGGETS.—*Mountain Messenger*, Jan. 20: Three nuggets, weighing 18, 21 and 55 ounces, have, within the past few days been found in the Bald Mountain dump, Forest City.

THE Bald Mountain Co. are surveying the Extension tunnel this week. We hear that the Centennial Co., at Minnesota, have good prospecting gravel. The Bald Mt. Ex. Co. have rich gravel in their main tunnel being run eastward up the ridge.

FIR CAP.—At Fir Cap the Phœnix boys have the main tunnel of the old Shamrock claim repaired, and in about 1,500 ft from the mouth. But two men are working at present, but more are expected soon. Our friends at Monte Cristo did not escape the recent cold snap. Dumpiles and flumes are all frozen up, the thermometer having registered as low as 5 above zero.

BY THE DRIFTING PROCESS.—Sierra County *Tribune*: The New York Hydraulic Mining Co., at Morristown, this county, have commenced drifting in one of their claims, which is the first mining over done by that process in the camp. Storage dumps have been built, and everything is in readiness for operating on an extensive scale. Sixteen men are employed at present, but this force will be increased as soon as a sufficient quantity of water can be procured. A large portion of the company's ground can only be worked profitably by the hydraulic process. Consequently, 5 large monitors are stationed in their diggings, ready for operating on the banks of hidden treasure as soon as the water season commences. The company have expended a large amount of money in developing their valuable property. Under the management of E. C. Wheeler, acting superintendent, work is carried on in a practical and economical manner.

FLATTERING PROSPECTS. The Centennial Co., at Minnesota, last Friday night struck soft bed rock with an increased flow of water. The gravel which they are running in has improved very much in quality and appearance the last few days. The company will push ahead for the main channel, which they expect to reach in a short distance. And from the present favorable indications something rich will be opened out.

A FINE PROSPECT.—We are informed, just before going to press, that the Bald Mountain Extension Co. had struck very rich gravel in their main tunnel.

SCALES DIGGINGS.—Charles Hendel & Co., who have started a bedrock tunnel on the south side of Slate creek, between Scales and Port Wine, for the purpose of opening out drift claims under the ridge, have got their tunnel in several ft, being in good working rock. The boarding house and blacksmith shop are completed.

DOWNIEVILLE.—The Secretary's statement of the receipts and disbursements of the Bald Mountain Extension shows as follows for the month of December: Receipts, $8,705 05; expenditures, $2,993 37. This looks promising for our rich neighbors. A few more like this, and they will begin to receive the return for which they have labored so long, and waited so patiently.

A RICH STRIKE.—We were informed, a few days since, that while two poor but honest miners were wending their way up Kanaka creek week before last, discussing the prospects of making a "strike," or "panning out" a fortune in some new diggings, and when a few miles below Alleghany, they discovered a gold nugget lying in the creek. This streak of luck prompted a further search, and still another nugget was found among the sand. The result of their operations was that in two days they obtained as the result of their labors about $300 in nuggets, weighing from 1 to 10 ounces. It is supposed that the gold was lost years ago by some miner.

SEVENTY-SIX CO.—Messrs. McCormick and Pierson, who have a contract with the above company for running 500 ft of tunnel at the Seventy-Six drift claim, are nearly through with the job, having only 20 ft more to run. It is expected to strike bedrock in that distance.

WORK TO BE RESUMED.—Work on the Germania mine, at Alahama hill, will be resumed early next spring. The company have already run 1,200 ft of tunnel, and it is expected to find gravel by advancing the tunnel 400 ft further. The claim is adjoining the Cray Craft hydraulic mine, the latter being owned by Eggleston & Mowry. A. J. Blohm, an owner in the Bald Mountain Extension, is heavily interested in the Germania mine, and he expresses considerable confidence that they will succeed in opening up a paying property.

TRINITY.

PAYING WELL.—Trinity *Journal*, Jan. 21: Mr. Lambert, who is superintending operations at the Brown Bear mill and mine in Deadwood district, for Grayson & Co., was in town the early part of this week. From those who conversed with him we learn that it is the intention of the company to put 10 additional stamps in the mill, doubling its capacity, in the spring. Thus far the operations have proved very profitable, and Mr. Lambert expects to produce $200,000 during the current year. The quartz interests of Trinity have at last got a start, and we predict the discovery and development of more quartz mines, and a rapid increase in the gold production from this source.

AT WORK.—From Mr. F. T. Hawley, lessee and superintendent, we learn that the Willshire mine at Cox's bar is running with all the water it can use at present. Other mines in that section are also at work, and the prospects are spoken of as "good, as usual."

NEVADA.

WASHOE DISTRICT.

OPHIR.—Cold Hill *News*, Jan. 21: On the 2700 level the joint California east drift has been extended 80 ft, and the main east drift has been advanced 26 ft. In the joint Mexican east drift on this level are cutting out a drain and putting in boxes. The same work is also being done in the joint Mexican east drift on the 2900 level. During the week 160 tons of ore have been extracted from the croppings, and 173 tons and 220 lbs have been sent to the mills.

OVERMAN.—East crosscut has been extended 54 ft; face in birdseye porphyry. Have cut and put in 41 ft of covered drain and seven sets of timber.

SIERRA NEVADA.—On the 2500 level the winze in crosscut No. 2 has been sunk and timbered 10 ft and east crosscut No. 5 has been extended 27 ft.

CALIFORNIA.—On the 2500 level the C. & C. winze has been sunk and timbered 13 ft. On the 2700 level the joint Ophir and California east crosscut has been extended 30 ft.

UNION CONSOLIOATED.—On the 2700 level the main north drift has been extended 31 ft and the main south drift No. 2 on the same level has been advanced 41 ft.

MEXICAN.—On the 2700 level in the joint Ophir east drift are cutting out a drain and putting in boxes. Have resumed work in the main north drift. On the 2000 level in the joint Ophir east drift are cutting out a drain and putting in boxes.

CONSOLIDATED VIRGINIA.—Are still cleaning out and repairing drifts and winzes connecting with the old Consolidated Virginia shaft on the 1650 and 1750 levels for ventilation. On the 2500 level the C. & C. winze has been sunk and timbered 13 ft.

GOULD & CURRY AND BEST & BELCHER SHAFT.—The west crosscut, 2300 level, is in 583 ft; northwest drift, same level, has been extended 44 ft; total length, 304 ft. Drillhole from face of west crosscut is in a distance of 145 ft.

UTAH.—On the 2250 level are putting in a balance bob and pump column in the incline. On the 2500 level the east drift advanced 17 ft.

UNION SHAFT.—Are easing timbers at the 1600 station and repairing air pipe at the 2500 level; also, are repairing the drain tunnel on the 1600 level.

CONSOLIDATED IMPERIAL.—The east crosscut, 2800 level, has reached a point 150 ft east of the south winze.

ALPHA.—The joint Exchequer drift, 2800 level, is now in 240 ft north of Alpha south line.

CANDELARIA DISTRICT.

NORTHERN BELLE.—*True Fissure*, Jan. 21: The main shaft has been sunk 9 ft during the week; the total distance made to the 10th inst. was 17 ft. From this time forward much better progress in sinking will be made. The fourth shaft level has shown considerable improvement. In the winze, sunk 25 ft below this level, the ore was found in be pitching to the northwest, and it has been followed by drifting a distance of 21 ft on the incline, which will be the main winze. In the levels above the adit there is a large amount of work being done in the mine, both in prospecting and in opening old stopes, some of which are looking very well. The daily yield of ore from the mine has been about 54 tons. Bullion shipments for the week ending January 18th, $14,057 66. Shipments on January account to January 18 h, $33,-268.87.

MOUNT DIABLO.—The continuation of winze No. 1, on the third level, has reached a depth of 65 ft and is showing bunches of low grade ore. The winze from the west drift on the second level is down 94 ft, and has a well-defined ledge in the bottom which gives low assays. An opening has been started on the ore near the face of the east drift, on the same level, and now shows a 4-ft ledge which is somewhat mixed with waste. Assays from this point average $65 per ton.

PRINCESS.—The work of cutting out and retimbering the shaft still continues and much better headway is being made.

CENTRAL DISTRICT.

ORE.—*Silver State*, Jan 24: One of Alex. Wise's teams came up from Central yesterday, loaded with 13 tons of ore from the Keystone mine.

CRABB DISTRICT.

PROSPECTORS.—Esmeralda *Herald*, Jan. 21: A correspondent writes that prospectors are coming into the district every day. J. C. Lupton sunk a shaft on his claim adjoining the Glenn Bros. claim, and at a depth of only a few ft struck a 2 ft ledge of very rich ore. At a depth of 2 ft the Glenn claim struck a fine ledge. J. B. Hill has started a shaft on his mine. Other parties will commence operations at no distant day. There can be no question as to the richness of the district. Everywhere that work has been done good prospects have been found.

DOWNEYVILLE DISTRICT.

FURNACE.—Cor. Grantsville *Bonanza*, Jan. 21: The furnace started up on the 9th, and has been running steadily and doing good work ever since. One load of bullion (10 tons) was shipped last Thursday night, the 12th, and three more loads are ready to ship as soon as teams get here. The bullion is very rich, richer than was ever produced here before, averaging twice as high as Eureka bullion. And still the ore bodies continue as large and rich as when I wrote you last. It is not often that as huge bodies of such rich ore are found in any district. We are feeling more than hopeful now. We feel that Downeyville will soon become one of the foremost camps in the State, and our faith in it be justified by the present and future results. All honor to Mr. Raphael for his faith and courage in standing in with the Downey Co. and helping bring about the upraising of our camp. We cannot say too much in praise of the whole management, and I certainly but echo the sentiments of the whole community when I say that we hope it won't be many days now until they begin to reap a rich harvest of do lars and cents for the money expended and the faith and endurance shown by all.

ESMERALDA DISTRICT.

THE MINES.—Esmeralda *Herald*, Jan. 21: There is nothing unusual to report of our mines this week. The Centennial and Cortez are doing about the same amount of work as heretofore, both mines showing good ore in nearly every drift. The Cortez, especially, is developing most satisfactorily to the management, and we do not exaggerate in the least when we say that so far as opened it is second to no mine in Nevada. Bull on will talk soon, the company build their mill in the Spring. There is talk of several good properties being started up in a few days.

MACHINERY ARRIVING.—A load of machinery arrived Thursday for the Humboldt mill. We understand the rest of the machinery is expected in a few days.

GOLD PARK DISTRCT.

WORK.—Grantsville *Bonanza*, Jan. 21: Work is progressing steadily in the mines at Cold Park, Nye county, with the most flattering results. The ore bodies are all looking well and producing a fine grade of ore. It is expected that the mill will be ready to drop stamps about the first of February. Work has been delayed by the snow and cold weather. As soon as everything is in proper running order the Gold Park mill will give a good account of itself.

GRANTSVILLE DISTRICT.

CENTENNIAL.—*Bonanza*, Jan. 21: Under the management of T. K. Murphy this valuable property is being rapidly developed. In the south shaft a fine 6-ft vein of ore is exposed which is widening as work progresses. The north shaft is being put in shape for work and the extraction of ore of a good quality will be commenced in a few days. On the 14th inst. a mining man of large and varied experience visited this property. He was surprised at the indications he saw in the mine and felt confident that large bodies of fine ore would soon be cut into. On the 18th inst. a 6-ft vein of nice looking ore was cut into. He took samples of ore from the mine that he claims will assay from $200 to $400, and thinks that the owners of this property ought certainly to feel happy over their prospects. The ore encountered is of a different character to any yet found in the district, being of a much higher grade and carrying occasional streaks of antimonial silver and stephenite. In fact, developments are now being constantly made in this mine that will warrant the erection of hoisting and reductiou works, which will render it easy to carry on operations on a much more extensive scale and a profit to the company. In proximity to this mine, and on the same mineral belt, there are numerous other locations that will undoubtedly be worked as soon as it is clearly demonstrated that the Centennial can be made a self-sustaining and dividend-paying mine.

MOREY DISTRICT.

BULLION.—Belmont *Courier*, Jan. 20: Good ore was extracted from the Morey District Co.'s mines during the present week, and the mill is running nicely, producing fine bullion.

REVEILLE DISTRICT.

CHLORINE ORE.—Belmont *Courier*, Jan 20: They are still encountering rich chloride ore at Reveille, and the day is not far distant when bullion will again be produced and shipped from that district. Manager Clarke feels confident that the Reveille mines will produce large quantities of paying ore. He is now actively engaged in the work of developing the Continental Co.'s mines.

ARIZONA.

TOMBSTONE PATENT.—*Epitaph*, Jan. 20: We learn that the Tombstone M. & M. Co. have received a patent for the Ooodenough claim. Those who attended the late trial of that company against the Way Up will remember the strenuous efforts of the defense to defeat the title of the company to that mine. Similar efforts were made in Washington to prevent the issue of the patent, no less than 5 hearings being had before the Commissioner of Patents and one before the Secretary of the Interior. The points involved are of interest to every mine owner in Tombstone, for in this case, as in some other recent cases, the peculiar circumstances of outcrop in this district were used against the application, and the failure of these attempts is an assurance to other bona fide owners that this district is not without the pale of the law, as some interested parties would like to have the authorities believe.

COLORADO.

EMPRESS.—*Register-Call*, Jan. 20: Mr. J. W. Holman has let a contract to Eggleston, Strender & Co. for sinking the main shaft on the Empress mine 100 ft deeper, its present depth being 432 ft. The contractors also do the timbering. The vein matter has improved of late. The contractors receive $21 per ft.

GOLDEN AGE.—At the Golden Age the 250 levels are being driven, and are now out each way from the shaft a distance of 28 ft. The mill dirt is running an average of two ounces gold per cord in doing development work. The smelting iron gives a net return of $100 per ton. It is the intention of Mr. Holman to resume sinking the main shaft as soon as the lower levels are far enough away from the shaft to protect the miners engaged in sinking. The vein matter in the 250 levels is about 4 ft wide.

EAGLE.—Messrs. Sayr & Owen, on the Eagle, west of the Golden Age, are running the 225 level east to connect with the Golden Age at a depth of 250 ft. This will give better ventilation. They are also sinking the main shaft, now down about 300 ft.

GOLDEN FLEECE.—The owners of the Golden Fleece, north of the Eagle, are in good pay, two shafts being worked on the line of the vein. A good quality of smelting iron is being raised, the mill dirt averaging 5 ounces per cord.

UNEXPECTED.—Major Hal Sayr has developed a good crevice of pay matter, smelting and milling, in the Unexpected lode in the working shaft, at a depth of 170 ft. The mill dirt runs 6 ounces gold per cord, and the last smelting ore yielded $90 per ton net. The Unexpected gives a very promising showing. Mr. J. S. Bates is continuing the development of the Arctic by a system of levelage and in sinking. After having encountered caprock for a time, the crevice is coming in again. It is understood that parties will take hold of the Caledonia mine next month and develop that property. Wilson Swain has miners at work developing the White House lode recently sold to Denver parties.

IDAHO.

MEN AT WORK.—*Times*, Jan. 18: At the Red Elephant group 5 men are employed. They have just begun work on a tunnel which is intended to tap the vein at a depth of about 175 ft. It will be 150 ft long. On the Durango group 5 men are doing the assessment work on the several claims—of which there are 15 in the group. On the Bullion mine 15 men are engaged in the usual work, to-wit: sinking the shaft, drifting and opening up stopes. The O. K. is being worked, as usual, by 8 men. At the Eureka 5 men are working. Sixteen men are pushing developments on the Jay Gould. About 20 men are employed at the Mayflower, and more will be put on as stope are opened, and can be worked to advantage. But good men only need apply. At the Idahoan, 10 men are employed. Senator Kaiser is working 4 men. Bates & Boyd are working 3 men. Barney Quirg is working 5 men. Besides the above, about 30 men are working on their claims in a radius of 2 miles from the town. Altogether, about 125 men are working on mines in and around Bullion.

MONTANA.

NEW COAL DISCOVERY.—Benton *Record*, 20: The new coal discoveries on Little Willow creek are exciting much interest in Benton from the fact of their comparative nearness to town and the superior quality of coal they show. Although the coal has only been entered a few ft, the coal is better than any now mined in the vicinity of Benton. Pieces of it thrown into the fire make a genuine coke. It is black and bright, and resembles Cannel coal. The tunnel is now in 18 ft and the vein is about 30 inches wide. It is expected that 40 ft more will bring the tunnel to the true vein. Messrs. Mills, Stedman and Buckland have located the mine and are starting in briskly to work the same.

BLACKFOOT.—Helena *Independent*, Jan. 20: From Mr. John R. Quigley we learn that placer mining in the vicinity of Blackfoot is receiving a fresh impetus. Three Mile gulch, so-called because it is three miles from Blackfoot, has been opened up by a 22-inch flume at the lower end, and good prospects of coarse gold have been found, which promise handsome returns in the spring. As the gulch is six miles long, with a width of from 300 to 500 ft, it will furnish many years of prospecting mining before it is exhausted. Illinois gulch, near Blackfoot, has also been opened by a 20-inch flume 1,000 ft in length. The upper portion of this gulch was worked years ago and proved to be exceedingly rich. The lower portion, now opened, is believed to be fully as good and will be more lasting. Eureka, Snow Shoe and other gulches in that vicinity are also attracting the attention of miners and will be worked extensively next season. Altogether the outlook for Blackfoot is exceedingly promising, and it is safe to predict the return, in a large measure, of the good old times when its immense yield of placer gold made it one of the liveliest and most notable mining camps in Montana.

WICKES WORKS.—The new works at Wickes are gradually getting down to business. The smelter has been in operation now about 30 days, in which time it has turned out 200,000 lbs. of bullion. The new 15-stamp mill was started last Monday and is running smoothly and regularly on good paying ore. The town of Wickes is at present peaceful, the disturbing element—whisky—having been ruled out of camp. There is not a saloon in the place, and but one (a pitiful affair) about half a mile from town on the road toward the Oregory mine. There are between 35 and 40 families now residing in the village and the town is slowly growing.

NEW MEXICO.

CLIFTON.—*New Southwest*, Jan. 14: The Lesinsky mines of Clifton have turned out 2,734,604 pounds of copper within the past 12 months. The first silver brick of bullion from the Silver King at Florence in 1881, was $1,-809,000. The shipment from the Globe district for same period was $736,000. The superintendent of the Santa Rita company thinks that the one large smelter now in process of erection at the works will be entirely insufficient to reduce the ore to be taken out of the mines.

PROSPECTS.—Of late there has been a great deal of mining excitement in El Paso on account of the "signs" and "shows" of gold, silver, galena, copper, and coal, in the Organ range and sierras of the Hueco, Guadalupes and El Paso, on the American side, and the San Elas, Candelarias, Borachos and the Amargosa in Mexico.

BLUE BIRD.—In a shaft 15 ft deep which John Lambert has recently sunk on the Blue Bird mine, in the same district; a vein 2 ft wide shows up at the bottom. From this there has been taken considerable free gold, a specimen of which was brought into our office this week. The average value of the ore both of gold and silver is at least $600. From this one shaft 5 tons of at least this value has been taken and it bids fair to increase in quantity as they sink further down.

OCEAN WAVE.—George Doyle, the owner of the Ocean Wave mine, Mogollon camp, was in our office last Monday and showed us some specimens of quartz from his mine showing free gold in extraordinary quantities. The vein at 9 ft deep is 2 ft wide, and the ore assays all the way from $450 to $665 per ton. Recent work on the Orphan Boy develops the fact that it carries more surface copper than any mine in the Mogollons. The assay of silver intermingled, amounts to between 50 and 60 ounces to the ton. This mine is owned by Geo. Doyle also. We have also seen some very rich specimens from the Madakoff and the Bismarck mines of Hug Andreas and Mike Grace.

UTAH.

SILVER REEF.—*Miner*, Jan. 16: The bullion shipments per Wells, Fargo & Co. for the week ending to-day amount to $20,141.05. Two or three pay-days during the next week ought to liven things up considerably. Somewhere about $70,000 will be scattered among the boys. Six bars of refined bullion were piled in the stage office for shipment on Wednesday. That says more for the sandstone belt than a column editorial. The bullion shipments since the new year commenced have been unusually heavy, and were it not for the fact that 2 of our mills will have to shut down temporarily for needed repairs, the bullion shipments for January would be ahead of any month during the previous year. The Copper Mountain M. Co. have filed an adverse claim against the issuing of a patent to Ellerbeck & Co., for the Red Cloud copper mine at Copper Mountain. The Messrs. Adams & Sons are removing their smelting plant from the Grand Ouich copper mines to the Rio Virgin, at St George. This will be a decided advantage to the Southern Capital,

Reagents for Blowpipe Assays.

Directions for Preparing them and Testing their Purity.

The substances employed to produce chemical chenges in hodiee for their recognition are termed reagents. The quantities needed are so small that it is usually advisahle to purchase most of them; but as it is often difficult to procure reagents of proper quality, or any quality at all in isolated mining regions, we give herewith some simple directions for preparing some of them and for testing their purity, as prepared hy the Professor of Mineralogy in the Sheffield Scientific School—Prof. Brush. All the reagents of a well-appointed laboratory may be of occesional service in the qualitative analysis of minerals; but reagents other than these given will he hut rarely needed hy the student in hlowpipe analysis:

Carhonate of Soda; or Soda, in hlowpipe language.—Either neutral carhonate or bicarbonate may he used. To prepare it, take 4 or 5 ozs. of commercial hicarhonate of soda, free from mechanical impurities, place it in a porcelain mortar, add a little distilled water, and pulverize finely. Bring it upon a large filter in a glass funnel, and allow the water to drain off. Successive additions of water, in quantities of ahout 1 oz., are made, until a few drops of the drainings, caught in a olean test-tuhe, and acidified with nitric acid, give no precipitate, nor even the faintest turhidity with a drop of clear solution of chloride of harium. The washing often requires several days, and is sometimes not complete hefore half of the salt has been washed away. It is thus freed from sulphuric acid, which contaminates the commercial salt. Soda that is purchased as pure should he tested for sulphur and eulphuric acid, hefore trusting its purity. The salt as thus prepared is epread out upon paper and allowed to dry. Part of it mey he hottled while moist, and used in that etate; hut a part must be dried at a high heat, in order to expel all water. It is then pulverized aud put away for use.

Biborate of Soda.—Borax. The commercial salt is usually pure enough. Clean crystals are selected, and coarsely pulverized. For some tests, fused horax is required. To ohtain this, some of the commerciel selt is melted in a platinum dish, and when cool placed in a tightly stoppered hottle.

Phosphate of Soda and Ammonia.—Salt of phosphorus. Microcosmic salt. The very small quantity of this suhstance (1 oz.) needed for a great number of trials is best purchased. It may be prepared by dissolving in two parts of hoiling water six parts of crystallized phosphate of soda, end one part (ell the parts hy weight) of white and clean sal-ammoniac, and immediately filtering while still hoiling hot. The crystals that separate on cooling are freed from the chloride of sodium that adheres to them hy recrystallization. *Testing*:—It must fuse on platinum wire to a colorless, perfectly transparent globule; and when oxide of copper is added, and it is again heated, it must not tinge the flame with a hlne or green color.

Nitrate of Cohalt.—Cohalt eolution. The crystals of nitrate are dissolved in 10 parts of water, and filtered if neceesary. For uee, the cohalt eolution is moet conveniently kept in hulhs. The hulh is eaeily made from a hit of glass tuhe. In order to fill euch a hulh it ie gently heated, and the tip placed heneath the eurface of a solution of nitrate of cohalt in a ehallow dish. When a drop of the solution has entered, it ie again heated, the drop is converted into eteam, the tip is again immereed, and the eolution will almost instantly rueh into the hulh. It should not he more than two-thirde filled. To apply the eolution, the hulh is grasped gently in the palm of the hand, and inverted, when the expansion of the air ehortly forces out a drop or more, as ie required.

Nitrate of Potash.—Clean crystals of the commercial salt are powdered.

Bieulphate of Potash.—Eqnal weighte of clean nitrate of potash and oil of vitriol are heated together in a porcelain dish, gently at firet, afterwarde more strongly, till the nitric acid and excese of eulphuric acid are driven off and a clear liquid remains, which eolidifiee to an opaque mase on cooling. The salt thus ohtained ie pulverized, and preserved in a glase-stoppered hottle. It can also he prepared hy heating pure eulphate of potaeh with an excess of eulphuric acid, until the excees ie driven away and the mass solidifies on cooling.

Cyanide of Potaseium.—In nearly every case thie reagent can he dispeneed with, hy one who has perfeot command of the hlowpipe, ite only uso heing to facilitate difficult reductions. It can be procured of any photographer or druggiet.

Iodide of Potassium.—The clean crystals purchased of any druggiet.

Sulphur.—Flowere of eulphur.

Tin.—Stripe of pure tin-foil a half an inch wide and one inch long.

Zinc.—Stripe of common sheet zinc.

Lead.—Pure lead, for detecting gold and eilver hy cupellation, ie prepared hy dissolving acetate of lead (sugar of lead) in hot water, filtering, and inserting strips of clean zinc into the eolution. After 5 to 6 houre the precipitated lead should he ecraped from the zinc in order to expose a fresh eurface. When the lead ie all separated, it is washed thoroughly with water, then dried hy pressing hetween folds of hlotting paper, and finally by exposure to a gentle wsrmth.

Iron.—Clean wire of the thickness of a medium-sized sewing-needle. Iron in a fine state of suhdivision is nsed for reductions in the wet way.

Magnesium.—Bits of foil or wire are uscful in detecting phosphoric acid.

Silver.—A smooth silver coin, which must he freshly cleaned at the time of nsing.

Bone-Ash.—A little cup of hone ashes, called a *cupel*, ie used for the detection of silver and gold. Bones hurned to whiteness are finely pulverizsd and reserved for these purposes.

Oxide of Copper.—A copper cent is dissolved in nitric acid, the solution is evaporated to dryness, and the dry mass gradually heated to redness in a porcelain dish.

Fluoride of Calcium.—Pure *fluor-spar* is crushed and heated in a test-tuhe until decrepitation ceases; it is then finely pulverized.

Oxalate of Nickel.—The pure salt ie hest purchased, and when fused with borax hefore the hlowpipe, must give a brown and not a hlue glass.

Test Papers.—Blue litmus papers: Digest one part of the litmus of commerce with six parts of water, and filter the solution; divide the intensely hlue filtrate into two equal parts; saturate the free alkali in the one part hy repeatedly stirring with a glass rod dipped in very dilute sulphuric acid, until the color of the fluid just appeare red; add now the other part of the blue filtrate, pour the whole fluid into a dish, and draw strips of fine unsized paper through it; suspend these strips over threads, and leave them to dry. When dry, the papsr should have a fine hlue color, and mey he cut in narrow strips and kept in a tight hox. The moistened paper should he promptly reddened by the smallest trace of acids, and is used for their detection. When the litmus paper is reddened by a very feehle acid, it may he used for the detection of alkalies.

Turmeric Paper.—Digest ore psrt of hruised turmeric root with six parts of weak epirits of wine, filter the tincture ohtained, and steep slips of fine papsr in the filtrate. The dried slips must exhihit a fine yellow tint. It is turned hrown hy alkalies, and ssrves also in the recognition of horic acid, molyhdic acid, and zirconia.

Brazil-wood Paper.—Brszil-wood is hoiled with water, the liquid filtered, and paper saturated with it and dried. It is used for detecting fluorine, which gives it a yellow color; it also serves to recognize alkalies, which color it violet.

Wet Reagents.

Water.—Whenever water is used in analytical operations it should bs either distilled water, or clean rain-water.

Hydrochloric Acid.—Muriatic acid. The etrong commercial acid will answer for most purposes, hut it ie also advisahle to have some of the pure fuming acid, which on evaporation leaves no residne and when diluted with water gives no milkiness on the addition of chloride of harium.

Sulphuric acid concentrated, (ordinary oil of vitriol).

Nitric Acid, pnre.—It must leave no residue upon evaporation, nor give any turbidity with nitrate of eilver.

Phoephoric Acid.—The officinal concentrated eolution.

Ammonia.—It must he colorless, ehould leave no reeidue when evaporated on a watch glase, nor should it cause the sligutest turhidity in lime-water.

Carhonate of Ammonia.—One part of the commercial ealt is dissolved in fonr parts of water, to which one part of solntion of cauetic ammonia hae heen added.

Chloride of Ammoninm.—Select euhlimed white sal-ammoniac of commerce. If it contaiue iron or othor impurities it ie diesolved in hot water, and eet aside to recryetallize. The dried crystale are diesolved for uee in eight parte of water.

Phospbate of Soda.—Purify the salt of commerce hy recryetallization, and diesolve one part of the pure salt in 10 parte of water.

Oxalate of Ammonia.—Diesolve commercial oxalic acid, which has heen pnrified hy recryetallization, in two parts of hot water; add caustic ammonia, or carhonate of ammonia, until the fluid hegins to manifeet a slight alkaline reaction; filter, and eet aside to cool. The cryetale that eeparate are allowed to drain, and the mother liqnore are further evaporated to cryetallization. Purify hy recrystallization. Dissolve one part of the pure ealt in 24 parte of water.

Potassa.—Diseolve eome eticke of cauetic potassa in water, allow to etand, and eeparate the clear solution from the eediment hy decantation.

Chloride of Barium.—Thie salt may he purchased of any druggiet. For use, it ie dissolved in 10 parte of water.

Nitrate of Silver.—May he procured in cryetale from any druggiet or photographer.

Bichloride of Platinum.—Treat platinum filings (purified hy hoiling with nitric acid) with concentrated hydrochloric acid and some nitric acid, and apply a very gentle heat, adding occasionally fresh portione of nitric acid, until the platinum is completely diseolved. Evaporate the eolution to drynese on a water hath, with addition of hydrochloric acid, and dissolve the reeidue in ten parts of water for use. It is used for detecting potassa in the presence of eoda and lithia.

Molybdate of Ammonia.—Pulverize the snlphide of molyhdenum as finely as poseihle, and roaet it in a ehallow eheet-iron or earthen dish, at a low red heat, nntil it tnrns yellow, and becomee converted into molyhdic acid. It ie then digested with ammonia, which extracts the molyhdic acid; the solution is filtered, evaporated to dryness, and the molyhdate of ammonia which is left ie dissolved in water acidulated with nitric acid and kept for nse.

Removing Debris from Tunnels.

An entirely novel suggestion for the rapid removal of debris from the workings of narrow tunnels, driftways, or adits, hae heen made hy Mr. Emil Schrahetz, C. E., of Vienna, the removal heing effected without interfering with the work of the excavators, hy providing boxes or receptacles which are conveyed to and from the head of the workings along one or more overhead railways, eo that instead of, as at present, causing the debris to be changed into receptaclee which the men themselves have then to convey to the rear, thus interfering more or less with the work of the excavators, the men charging the receptaclee do not leave their position in front of the workings, the receptacles when filled heing raised to the overhead railway along which they are conveyed to the rear hy any convenient means. For these purposes, according to one arrangement, en overhead rail is snspended hy hrackets from transverse heams carried hy uprights at the side of the tunnel or driftway. The rail may he in long continuons lengths, or for facility of rapid erection and removal, it is mede of short lengths having tapered ends that overlap each other and are secured to the hrackets hy keye or holts. The hrackets are adjustihle in height on the beame, so as to adjust the level of the rail, either hy means of wedges, or by forming the pendant part separate from the part secured to the heam, and providing hoth parts with toothed or notched faces that take into each other, and are secured by a ring embracing both when adjusted to the deeired hight. The rail may he provided with shunts and switches, when there is only one line of rails, for trucks running in hoth directions to pass each other, or there may he two or more lines of rails. The trucks consist of metal frames with wheels running on the rails, and with pitch wheels or barrels, over which pass chains or cords for raising and lowering the boxes charged with the debris. The axes of these pitch wheels or harrels have ratchet wheels rotated hy levers cerrying pawls, the levere heing hy preference of short length, and provided with eockets or pins to which may he temporarily connected long levers for working them from the floor of the tunnel.

Variations in detail are, of course, permissihle, so that it will readily he understood that the hoxes may he raised hy simply hauling at the chaine or ropes without gearing, or the hoxes may be lifted by hand, and either he suspended from hooks on the carriages, or they may have loops at their uppsr ends, with one or more rollers, hy which they are hung directly on to the rails without separate carriages; or again where compressed air or water pressnre is available, the raising may he effectsd hy means of a small motor engine worksd hy air or water pressure. The hoxes may either consist of simple rectangular receptacles, by preference suspended hy chains attached to trunnione eitnated at or near their center of gravity, so that they can he readily tipped over eo as to deliver their contents into the wagone for the dehrie at the rear of the workings, or they may he conetructed of two halvee hinged together at their upper edgee and held together hy a suitahle holt or catch at hottom. To tbe two halves are eecured the ends of a toggle, to the middle joint of which ie attached the euspending chain, eo that on releasing the eaid holt or catch, the pull on the toggle hy the chain will canse the two halves to open at the hottom and deliver their contente into the wagon. Or in place of emptying the hoxes into the wagon they may he lowered with their contente into the latter, to he discharged outside the tunnel.

According to another arrangement, there ie provided in place of, or in combination with, the fixed overhead railway a portahle length of overhead railway, coneieting of a framing or carriage running on wheele on the floore of the tunnel, on the top of which are one or more heams with raile projecting at the front end eufficiently heyond the carriage to extend to the tunnel head, eo that the trucks with the hoxee can rnn thereon right up to the place where they are to he charged, while at the rear end the heame either hnt against the end of a fixed overhead railway, eo that the trucke can rnn from the one on to the other, or the beame are made to overhang eufficiently for the wagone to he hrought underneath them for receiving the dehrie from the hoxee. These portahle railways, when hrought into position, are eecured hy strutts against the roof and eides of the tunnel, the sti atte consisting by preference of ecrew spindlee ecrewing into cylindrical sockete, whioh are turned hy meane of spanners. The carriage with the portahle railway may extend either the whole or part of the width of the tunnel, and they may have either a douhle or eingle line of railways, or the trucks carrying the hoxee may he made the full width of the framing rnnning on two raile, in which caee, for the eonvenience of working, the levers for raising the hoxes, the shafts, with the pitch-wheel and gearing, may he arranged in diagonal positione.

Senator Miller hae preeented to the Senate the memorial of the California Academy of Sciences, urging a continuance of the coaet and geodetic snrvey in Alaska.

Miners' Superstitions.

Whistling Underground.

A singular eupsrstition prevails among foreign-horn minere in the great Pennsylvania coal fields, that if anyhody whistles in a mine some disaster is sure to follow. Miners born in this country do not share this superstitions helief to any great extent, hut in deferenoe to the wishss of fellow lahorers, they never whistle in the minee. Sometimes they sing and hum their plaintive hallads hundreds of feet helow the surface of the earth, and as a rule, miners are cheerful and contented. The superstitious helieve that a "good luck spirit" lurks in every mine, and that at the sound of whistling it flies, and leaves the minere at the mercy of numberless "spirits of evil." A terrihle mine disaster occurred in 1840, which was caussd, it is claimed, hy the whistling of one of the miners. The mine was the propsrty of tbe Delaware & Hudson Canal Co., and was not properly supported with strong timbsrs. This fact was known to most of the miners, and the shaft, a mile in length, was to have heen ahandoned in a few days. The miners were ahout to quit work, when a reckless parson named "Jack Richards" suddenly laid down his pick, and startled his companions by saying he would whistle a jig eo they could dance a farewell to the mine. The miners in vain proteeted, hut Richards laughed at their superstitious idees, and oommenced whistling. The miners were preparing to leave the plece at once, and the more frightened they hecame, the louder and faster Jack whistled. In the midst of the tune, a dull, roaring noise was heard, and every cheek hlanched with terror, for they knew the mine was caving in. "Jack" advised tbem all to run for their lives, and be led the way. Another crash ceme, masses of falling rock thundered down, and they were imprisoned—these 17 men, in a space only 40 feet square.

Imprisoned in a Mine.

The gust of wind that had rushed through the shaft when the caving-in occurred, had extinguished every lamp, and, for a wonder, there was not a match in the party. They oursed Richards heartily, hut he did not respond. Subsequently he was found dead, crushed hy the fallen coal and rocks. He was the only one of the party who was injured in any way. The imprisoned men worked as men never worked hefore, and as they were ahout giving np all hope of ever seeing their friends again, a noise was heard against the rocks and they oould hear the regular click of the picks of the men who were working to rescue them. Preeently a ray of light was seen, and in a half hour more the men were saved. The hody of Richarde was extricetsd and taken to his home for hurial. Very few of the miners attended the funeral, helieving that tho disaster was due entirely to Richarde having driven the "good epirit" out of the mine with his lively whistling. Richards had no relatives in the world hut a sickly sister, and she was so prostrated hy the loss of her hrother that she died the next day, and the two were huried at the same time. A mine hoss, named Hosie, was also imprisoned in the mine and given np for dead. Three days after the terrihle accident he made his appeerance, haggard and pale. He had dug his way for an incredihle distance through the dehrie, without food or water to enetain him. Thie mine tregedy is a favorite topic among the old miners, who never fail to warn visitors who descend into the ehaft that they must not whietle or talk loud enough to frighten away the "good epirits."

The Burning Mine.

Near thie place, and within a few steps of the famous Switchhack railroad, ie the great hurning mine, which hae heen on fire eince 1858. The origin of the fire is acoonnted for hy the euperstitioue from the faot that a ekeptical miner was whistling in the shaft, and hardly had he ceased when the announcement oame that the mine was on fire. Thie mine hae been flooded, but the fire cannot he extinguished, and every year it keeps on gnawing its way through the vast veine of coal, deetroying millione of tone of anthracite.

On the 2d of Decemher, 1872, Morgan Powell, a mine hoee, imagined he heard a man whistling in the shaft. Inveetigation proved that no one had heen whietling at all. He was told hy the minere that he had had a had omen, and that eome trouhle would hefall him. That night, as he wae leaving the etore of Capt. Williameon, at Summit Hill, midway between Laneford and Mauch Chunk, he wae ehot dead by Mollie Maguire aeeaeeine, who were afterwards captured hy Detective McParlan and hanged at Manch Chunk. The minere think it wae the whietle of the fatal hullet he heard that morning.—*Philadelphia Times.*

Turner has introduced in the House a joint reeolntion providing that Congrese ehall have no power to paee any act or reeolution for the appropriation of any money or creation of any debt exceeding $10,000 at any one time, unlese the eame, on its final passage, ehall be voted for hy a majority of all memhera then elected to each hranch, and the ayes and noee entered on the journal.

A "Solar" Locomotive.—According to *Nature*, "a 'eolar" locomotive has heen placed in the French Northern railway. It ie eo called owing to an electric light which is placed in front and fed hy the engine iteelf, and intended to illuminate the way for a long dietanoe in front."

Debris.

In the course of an examination in the Gold Run case, Mr. L. L Robinson, President of the Miners' Association, described the canals and reservoirs comprising the water system of the North Bloomfield, Milton, and other mines, claiming that the storage of water in winter and the discharging of the same into the streams during the dry season had a beneficial effect upon the navigable streams of California. He enumerated the causes which induce natural wash, claiming that this natural wash is very large, and annually increasing. The denuding of the mountainous districts of timber, and frequent and extensive forest fires, add very largely to the natural wash. When I first became acquainted with the country along the Yuba in 1856, there were extensive forests of fine timber. Now it is all, or nearly all, cut off. Some of the reservoirs on that divide are situated at an elevation of 7,000 ft., and very many of them more than 6,000 ft. When the present owners of the North Bloomfield and Milton mines purchased their property, the surface had nearly all been washed off—in some places to a depth of more than 100 ft. This was of a looser and much lighter material than that at present being worked in those mines. The amount of displacement by hydraulic mining annually is about 40,000,000 cubic yards. I have examined into this matter very closely. One of the tunnels at the North Bloomfield mines is over 10,000 ft. in length; was two years in construction, and cost many thousand dollars. The ravines into which those mines dump are filled to a great depth by the coarse debris. The river is also widened and filled to a great depth with this material, and it remains there to-day intact, and I have every reason to believe it will remain there forever. The number of mining inches taxes paid on by hydraulic miners, under the Debris Act, was 9,500,000. The giants and monitors do not increase the amount of material wash, but save labor. They are a labor-saving machine. Frequently, in the early days, during the time I was engaged in constructing the Sacramento Valley railroad, I had occasion to visit San Francisco, and I recollect very well of the difficulty of the river navigation at that time at the Hog's Back and other shoals. The natural wash of Quercus creek, a small stream about seven miles in length, which is dry nine months in the year, has changed its channel in different places quite often, and during the past four years has deposited on my land 2,600,000 cubic yards of material. Mr. Robinson named the great number of creeks, ravines and gulches which pour into San Pablo bay from the agricultural districts and steep slopes contiguous to the bay, and stated that the natural wash contributed by those myriads of streams was simply immense. Mr. Robinson traced the debris flow from the Cherokee mine, through Sawmill ravine, the valley of Deer creek, and thence to the head of Butte slough. The tailings are all impounded, and the slickens caused to be deposited on the soil to such an extent that the water when it reaches the slough is just as clear as it was when it first entered through the pipes in the Cherokee mines. In this case the miner is enriched, the farmer is enriched and the water enters the river in all its original purity. The hydraulic mines in which I am engaged could not be worked with profit in any other way except by the hydraulic process. They would not pay expenses by the drifting process, but by the hydraulic process they would pay very largely.

I have invested more than half a million in the Bloomfield mines. Our largest investments consisted in constructing canals and reservoirs. The dividends from those mines have been over $800,000, and if we had not been enjoined this year, we should have declared an additional dividend of more than $500,000. The gross amount of gold that has been taken from those two mines amounts to $3,835,000. The Cherokee mines are about 12 miles from Oroville and about 30 miles from Butte slough. These mines are worked by the hydraulic process. Their deepest tunnels are not yet completed. They are working in the upper gravel, and have not as yet mined deep enough to get the heavy blue gravel. These mines are owned and worked by the Spring Valley Gold and Hydraulic mining Company.

Bears and Wolves and Telegraphs.—The director of the Norwegian telegraph says: That bears are often attracted by the humming of the wires, which sound, they evidently suppose, comes from a swarm of bees. On reaching the posts and finding no hives or honey in sight, they appear to conclude that it is hidden under the heap of stones which is generally piled up around the foot of the poles, and accordingly scatter them in all directions. When the first telegraphic lines were established in Norway, an attache of the government stated that, although his district had no direct interest in the proposed line, he would vote for the appropriation, because, in his opinion, the wires would drive all the wolves from the region, for it had been noticed that wolves, however hungry, would never pass under a wire or rope; they would not enter a yard which was protected simply by cords stretched from post to post around it. Be that as it may, it is said that for this or some other reason, no wolves have been seen in that region for 20 years, during which time telegraph wires have been stretched across the country.

Useful Information.

Polishing Wood.

Turned articles must be brought to a fine, smooth surface with the finest sand-paper, and the direction of the motion should be occasionally reversed, so that the fibers that are laid down by being rubbed one way may be raised up and cut off. To apply the polish, which is merely a solution of shellac in alcohol, take three or four thicknesses of linen rag, and place a few drops of polish in the center; lay over this a single thickness of linen rag and a drop or two of raw linseed oil over the polish. The rubber is then applied with light friction over the entire surface of the work, while revolving in the lathe, never allowing the hand or mandrel to remain still for an instant, so as to spread the varnish as evenly as possible, especially at the commencement, and paying particular attention to the internal angles, so as to prevent either deficiency or excess of varnish at those parts. The oil in some degree retards the evaporation of the spirit from the varnish, and allows time for the process; it also presents a smooth surface and lessens the friction against the tender gum. When the varnish appears dry, a second, third, and even further quantities are applied in the same manner, working, of course, more particularly upon those parts at all slighted in the earlier steps.

Flat surfaces are polished in a similar manner. The wood must be filled, as it is called, and for this nothing is better than whiting, colored so as to resemble the wood and kept dry. Rub the latter with linseed oil, and then sprinkle it with whiting. Rub the latter well in, wipe it off carefully and give time to dry. This is far superior to size.

The polisher, however, generally consists of a wad of list, rolled spirally, tied with twine and covered with a few thicknesses of linen rag. Apply a little varnish to the middle of the rubber, and then inclose the latter in a soft linen rag, folded twice. Moisten the face of the linen with a little raw linseed oil, applied to the middle of it by means of the finger. Pass the rubber quickly and lightly over the surface of the work in small circular strokes, until the varnish becomes nearly dry; charge the rubber with varnish again, and repeat the rubbing till three coats are laid on, when a little oil may be applied to the rubber and two more coats given it. Proceed in this way until the varnish has acquired some thickness; then wet the inside of the linen cloth, before applying the varnish, with alcohol and rub quickly, lightly and uniformly the whole surface. Lastly, wet the linen cloth with a little oil and alcohol, without varnish, and rub as before until dry. Each coat is to be rubbed until the rag appears dry, and too much varnish must not be put on the rag at one time. Be also very particular to have the rags clean, as the polish depends in a great degree upon keeping everything free from dust and dirt.—*Exchange.*

Production of Magnesia.—The cheap production of Magnesia on a large scale has become a subject of much technical importance since this material has been found to be quite important in the manufacture of cements, artificial stones, fire-proof bricks, and other refractory materials. The immense quantities of chloride of magnesia found in the celebrated salt deposits at Staesfurt, in Prussia, have caused many efforts to be made to produce magnesia from this source. The latest proposal of this kind is that of M. Closson, of Paris, who treats the chloride of magnesium lyes with burnt dolomite, and has apparently succeeded in producing a very pure magnesia. Magnesia bricks made from material produced by this process, have, according to the *Chemical News*, withstood even the heat of the oxy-hydrogen flame. The process of M. Closson, according to published accounts, has been introduced on a working scale at Leopoldshall.

Blue Sugar.—Granulated sugar is frequently found to have a peculiar blue tinge, the cause of which has been a mystery to many, and we frequently receive inquires respecting the matter. The explanation of the mystery is found in the fact that the sugar dealers have stolen one of the arts of the laundry, and undertaken to hide the yellow color of low-grade sugars by means of bluing, just as the laundry woman makes yellow clothes look whiter by the use of indigo. The coloring matter used by refiners is that known as ultra-marine blue. This chemical compound cannot be recommended as an article of food. Hence, we would suggest that all sugars possessing a bluish tinge should be discarded.

Gilding Steel.—Polished steel may be beautifully gilded by means of the ethereal solution of gold. Dissolve pure gold in *aqua regia;* evaporate gently to dryness, so as to drive off the superfluous acid; redissolve in water, and add three times its bulk of sulphuric ether. Allow to stand for 24 hours in a stopped bottle, and the ethereal solution of gold will float on the top. Polished steel dipped in this is at once beautifully gilded, and by tracing patterns on the surface of the metal with any kind of varnish, beautiful devices in plain metal and gilt will be produced. For other metals, the electric process is best.

"Pebble" and "Glass" Spectacles.

The question is often asked, "What is the difference between 'pebble' and 'glass' in spectacles, and how may I distinguish the one from the other?" "Pebble" is much preferable, from the fact that it is harder and less liable to be scratched. A careful examination of the two, after a few months' use, will show this. "Pebble," which is made from the finest of large quartz crystals, by sawing into slabs, grinding and polishing, is much more transparent than glass. This is shown by placing a pebble lens between two plates of tourmaline, to polarize the light, when the light will readily pass through. But if the very best of flint or crown glass is subjected to such a test, the light will not pass, showing the greater transparency of the former.

A glass may be quite readily distinguished from a pebble lens by applying first the one and then the other to the tip of the tongue. The pebble will be found very sensibly colder than the glass.

Sometimes pebbles are cut, either through ignorance or a desire to cut them to the best advantage, at right angles to the axis of refraction; in all such cases the rays of light are split up in passing through the lens, and are therefore injurious to the eye. The crystal is sometimes defective in formation, not homogeneous or of stratified growth. Lenses made from such pebbles are little, if any, better than glass. In purchasing, buy only of an established dealer, who thoroughly knows the quality of his goods, and who will not endanger the eyes of his customers for the sake of a little iniquitous gain.

Presence of Mind.—A fire started a short time ago under the counter of a prominent drug-store on Chestnut street, Philadelphia. A cool-headed clerk, remembering the soda-water fountain, sent promptly to the cellar for a piece of India-rubber gas tubing, and slipping one end of this over the nozzle of the soda-water fountain faucet, turned on the tap, and immediately he had a powerful head of water highly charged with carbonic acid gas, the first dash of which on the fire put it out entirely.

To Solder Brass and Iron with Soft Solder.—Dissolve zinc in muriatic acid until action ceases. Reduce with water, and apply to the surfaces to be soldered. If the brass and iron are clean there will be no difficulty in soldering them together with a soldering iron or blowpipe.

Good Health.

Manageable Anæsthetics.—Paul Bert has been experimenting upon the anæsthesia of animals with mixtures of variable proportions. He calls the interval between the anæsthetic dose and the mortal dose the manageable zone, and his experiments seem to indicate that in all cases the mortal dose is just double the anæsthetic dose. If the mixture represents about the middle of the manageable zone, an animal is quieted very rapidly, and remains tranquil during the whole time of the experiment, even if it lasts for two hours. A few drops of the liquid, if they are breathed without a proper mixture of air, may suffice to carry the patient from the manageable to the mortal zone. Most anæsthetics seem to act, not by the quantity, but by the proportion which they hold to the air that is breathed. It seems probable that these proportions may be so exactly ascertained that all anæsthetics may be used with perfect impunity.—*Comtes Rendus.*

A Good Laugh.—What a capital, kindly, honest, jolly, glorious thing a good laugh is! What a tonic! What a digester! What a febrifuge! Better than a walk before breakfast or a nap after dinner. How it shuts the mouth of malice and opens the brow of kindness! How, like a thing of beauty, it is a joy forever; there is no remorse in it. It leaves no sting except in the sides, and that goes off. Even a single unparticipated laugh is a great affair to witness. But we are glad it is seldom single. It is more infectious than scarlet fever; you cannot gravely contemplate a laugh. If there is one laugher and one witness, there is forthwith two laughers. The convulsion is propagated by sound. What a soul-inspiring thing it is when it becomes epidemic.—*Good Health.*

Boys Smoking.—Mothers have a duty to perform toward their boys in teaching them to avoid tobacco. Some investigations by Decaisne, of Paris, may help them in the discharge of this duty. Ducaisne examined a large number of young smokers, and found the following symptoms evidently due to this habit: Palpitation, intermittent pulse, chloroanæmia—besides this, the children showed impaired intelligence, became lazy, and were disposed to take alcoholic stimulants. The latter effects are worse than the first, and no doubt grow out of them.

Cure for Ringworm.—It is said that a sure cure for ringworms is found in the use of a wash, prepared by soaking a bit of chewing tobacco the size of a raisin, with the same quantity of saleratus, in a spoonful of vinegar. Apply the wash faithfully for several days, until the skin is restored to its natural state. This remedy never fails, even in cases of open sores of enormous proportions.

Action of Coffee and Sugar on the Stomach.

M. Leven has communicated to the Paris Society of Biology, some experiments which he has made on this subject on dogs, with the assistance of M. Semerie. The action of coffee on the stomach has been much discussed and variously interpreted. The majority of writers admit that coffee stimulates the circulation and provokes hyperæmia of the gastric mucous membrane; but they have not adduced experimental proof of the fact.

The contrary opinion is supported by a certain number of observers, to whom M. Leven has given in his adhesion. He recalls to mind the experiments which he made some years since on caffeine absorbed by frogs, guinea pigs and rabbits. It retarded the action of the heart, which, at the same time, became strong; it increased the arterial tension; like the vaso-constrictor agents, it dilated the pupil. Caffeine has even been used in certain cases to replace digitaline, of which it has, to a great extent, the properties, though in a smaller degree.

The latest experiments of M. Leven were as follows: He gave to a dog a meal of 200 grams of meat; he then administered an infusion of 36 grams of coffee in 150 grams of water; the animal was then killed, and, at the end of three hours, the stomach still contained 145 grams of meat, while in the absence of coffee it only contained about 100 grams. The abdominal mucous membrane was pale as well on the external surface as in the interior, and the vessels were strongly contracted. It follows, then, that coffee, producing anæmia of the stomach, retards digestion; and, the anæmia repeating itself, ends by bringing on habitual increased congestion of the stomach, which, according to M. Leven, is synonymous with dyspepsis.

It is well known, and English physicians have laid great stress upon this point, that the abuse of coffee and tea often brings on gastralgia, dyspepsia, and, at the same time, more or less disturbance of the apparatus of innervation. It is, therefore, necessary precisely to distinguish the local anæmia produced by coffee on the stomach from the more general action exercised by it over the central nervous system, and which has conferred on it the merited qualification of an intellectual drink. In opposition to coffee, sugar is, according to M. Leven, an eminently digestive substance, and he does not fail to order it in certain cases of dyspepsia. He has made the following experiments: He gave to a dog 80 grams of sugar at the same time as 200 grams of meat; six hours afterward there was nothing found in the stomach but 20 grams of undigested meat. The abdominal mucous membrane was red and turgescent; the liver was wholly congested.

M. Leven draws this practical lesson from his experiments: That the infusion of coffee should be sufficiently sweetened to stimulate the secretory function, and thus assist digestion.—*British Medical Journal.*

Warm Milk as a Beverage.—Milk that is heated to much above 100° F., loses for a time a degree of its sweetness and density. No one who, fatigued by over-exertion of body and mind, has ever experienced the reviving influence of a tumbler of this beverage, heated as hot as it can be sipped, will willingly forego a resort to it because of its having thus been rendered somewhat less acceptable to the palate. The promptness with which its tonic influence is felt is indeed surprising. Some portion of it seems to be digested and appropriated almost immediately; and many who fancy they need alcoholic stimulants when exhausted by fatigue, will find in this simple draft an equivalent that will be abundantly satisfying and more enduring in its effects.

Cold Draughts vs. Cold Baths.—Dr. Dio Lewis says cold baths of the skin are good, but it is doubtful if flooding the stomach on going to bed and on rising is not, on the whole, the most profitable form of cold bathing. Costiveness, piles and indigestion are uniformly relieved by this morning and evening cold douche. The quantity must be determined by each one for himself. Two or three swallows will do to begin with, but the quantity will soon grow to a tumblerfull; and I have known persons to use much more with marked benefit. If advisably managed every dyspeptic will be greatly improved by this cold stomach bath.

Artificial Bone.—A young lady in Erie, Penn., has been troubled for some time past with a malignant cancer on the right side of her lower jaw. The physicians have decided to remove the jaw and insert a celluloid jawbone to replace the one taken out. This has been done but two or three times before, it is claimed, and the result of the combined operations is being watched with the greatest interest by the medical profession.

To Take the Gold Plate off a Silver Watch.—If the plate is thin dip it momentarily in a little mercury and rub with a piece of soft chamois leather. Repeat the dipping (in fresh mercury) several times, or until the gold color has been removed. Then heat the case until the film of mercury adhering to the silver has been dissipated. The mercury should not be allowed to remain too long in contact with the silver, The case should, of course, be separated from the works before being operated upon.

Passing Events.

The heavy and frequent showers of rain, which have been falling during the past week, bring renewed assurances of a prosperous season for both miners and farmers.

The greatest event of the week, is the result of the long-pending trial of the murderer of President Garfield; and most persons will feel relieved to know that a verdict of "guilty as charged," has been found against him.

THE MINING AND SCIENTIFIC PRESS this week consists of 24 pages, and our readers are reminded that this number is one worthy of preservation for future use. Our annual review fills nearly five closely printed pages, and it gives in a comparatively brief space a resume of the condition of the mining industry over a very large territory.

We have compiled, also, such statistics of bullion production, etc., as would be interesting in this connection. The latter work shows a great deal of information in brief space. Although this review may seem somewhat extended, it is really brief, when the ground covered by it is considered.

Judging from the result of the year's work, we may expect a very much larger yield next year. Hundreds of prospectors will, in the spring, encouraged by discoveries of last season, start work in the mining regions. Altogether, the outlook is favorable.

THE Central Pacific Railroad Co. has declared the usual semi-annual dividend of 3%, payable February 1st.

Drift Mining.

The Gravel

Is broken or breasted out from that side of a block furthest from the main drift, the length of face of the breast being the distance between the cross drifts. Only the finer gravel is thrown into the cars and taken out of the mine, the large bowlders being piled in the worked-out ground. As soon as the gravel has been breasted out to a distance of about seven or eight ft., the tramway track is moved from the drift to this space, thus bringing the cars close up to the face again; the drift is then utilized for piling up the waste rock and bowlders. When the face is again worked off seven or eight ft. in depth, the track is moved, and the cars brought up to the gravel, and the work is so carried on till the entire block is removed. The worked-out space becomes more or less filled with bowlders, according to the nature of the gravel deposit. As a general rule, the depth of the gravel on the bedrock containing sufficient gold to pay for drifting is not over four to six ft. Occasionally it is more—12, 16, and even 30 ft. in depth. Again, while that portion immediately on the bedrock containing gold may be only five or six ft. deep, at a comparatively small distance above, 20 or 25 ft., may be another stratum of gravel that will pay to drift. These such pay streaks are, known and worked in the Paragon, or Breece and Wheeler drift mine at Bath, in Placer county. First, about 6 ft., immediately on the bedrock, then some 10 or 15 ft. higher, a stratum of pay of about the same thickness, then a third seam, 150 ft. above the bedrock; this latter worked through a separate tunnel. Where 10 ft. or more depth of gravel is mined, the breasting is done in two or more benches. Very long timbers are used, and if the gravel is at all soft, and liable to cave, great care must be taken to place them and the lagging properly. Except where the gravel is very hard and cemented, considerable timbering is required. In many mines, in addition to timbers and caps placed quite closely together, it is necessary to use capa and top lagging, driving the latter ahead of the timbers, and close up to the face, as the gravel is removed from it. Blasting is not required, except in extremely hard and cemented gravels. As far as practicable, the gravel is broken out with the pick, as it is difficult to use powder advantageously.

The Cars

And track used in the gravel workings, where they discharge through shafts to a lower bedrock tunnel, are somewhat different in construction from those used for carrying the gravel to the dump, either directly from the workings or in the lower tunnel. The track in the workings, having to be moved often, is made in sections, so that it can be taken apart and put together without difficulty. Sometimes only wooden rails are used, but generally they are faced with a light strap iron. The cars are smaller, the dimensions varying in different mines; a convenient size has a box 5 ft. long, 24 inches wide and 20 inches deep. The carrying capacity varies from 600 or 700 lbs. to one ton. In the working tunnel, and in all drifts permanently used, the track should be well made. The wear and tear is considerable, and frequent repairs and renewal are necessary. The wooden rail, faced with strap iron, is in general use, but is beginning to be replaced in some large mines with long tunnels by a light T rail, weighing about 30 lbs. to the yard. Strap iron, for facing the wooden rails, 2 inches wide by ¼, ⅜ or ½ inch thickness, is oftenest employed, but iron one inch thick, is found to be much superior. The gauge of the track varies from 16 to 22 inches. The size of car is double or more in capacity over that used in the workings, carrying from 20 to 36 hundred weight. The cars are, as a rule, constructed of wood, oak being found the most durable. Iron cars are used to some extent, and are in every way superior, combining the three advantages of greater durability, economy of power in running and less weight than wooden cars of the same carrying capacity. In the mine the miners run the cars, dumping the gravel into the upraise, which, being closed with a gate at the bottom, holds the gravel till an empty car is placed in position to be filled from it. In the working tunnel a special force is best employed for running the cars out of the mine, particularly where the distance of carriage is great. Horse or mule power is much cheaper where much gravel is taken out, as several cars can be linked together in a train, and instead of one man to each car, one man and horse can handle a train of five or six cars. In a mine in Sierra county a small locomotive is used, and found to work well, but except where the amount of gravel to be handled is very large and the distance considerable, horse power would seem to be the most economical.

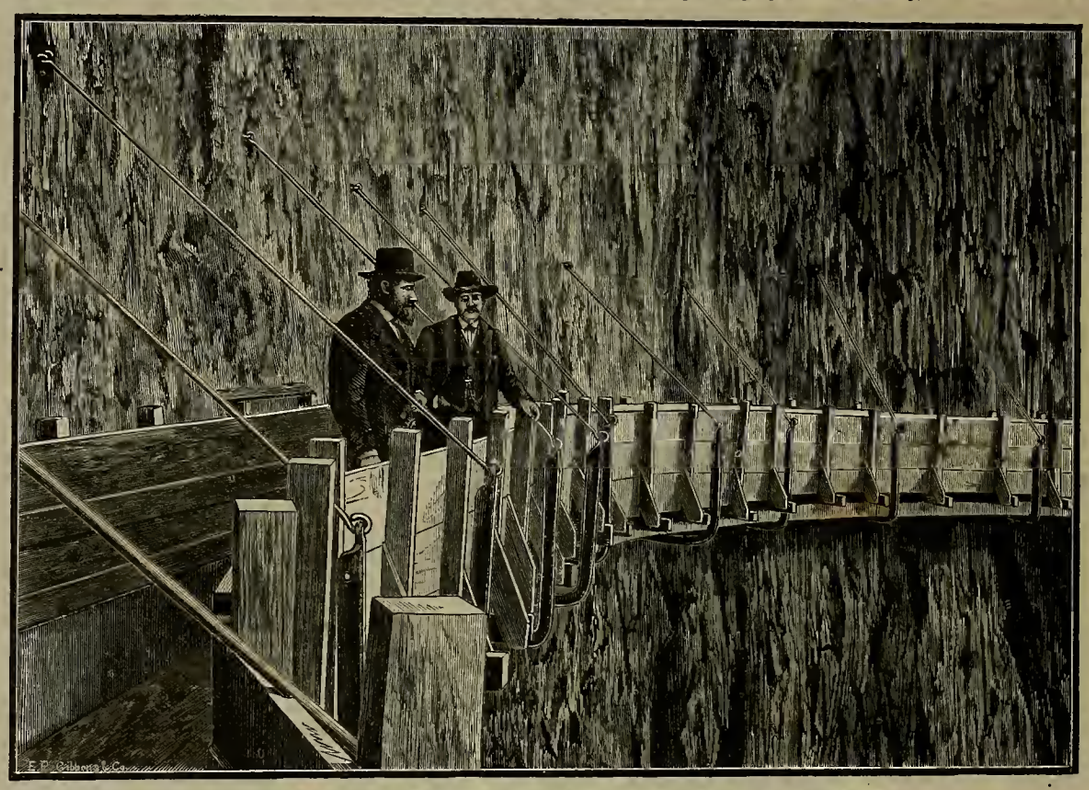

FIG. 2.—METHOD OF HANGING FLUME TO CLIFF BY IRON BRACKETS.

The Dump

For the gravel outside of the mine and the washing plant is variously arranged, according to the natural facilities it is possible to utilize. Assuming that the tunnel enters the mine from the head of some steep ravine, we have it in about its best position for dumping and washing arrangements. Directly in front of the entrance to the tunnel is the tank in which the mine waters are retained. This tank is made in the most convenient dimensions, and usually large enough to hold the accumulated flow of twenty-four hours. Below this tank, and running down the bed of the ravine, are the sluice boxes. The track leaving the tunnel divides into two or three branches; the main central one crossing the water tank is continued on a trestle over the boxes to the dump. The dump is made by covering the sloping sides of the ravine with planks and sheet iron, so that the gravel slides into the boxes during the washing. The second branch runs along one side of the ravine, and is used for taking gravel from drifts and ground it is desired to prospect to a special dump, so that it can be separately washed. The third branch runs along the other side of the ravine to such a distance as to be clear of the sluices, and is used for the cars containing the waste rock from the main tunnel. This is dumped where it will be out of the way. At some mines only two tracks are run, one on each side of the ravine, or one in the middle and the other on one side, the latter having a dump for gravel it is desired to prospect and one for waste rock. Sometimes in small mines only one track on the side is used for all three purposes. These tracks and the entrances to the tunnels are generally roofed over, as a protection from snow and rain. The washing is done once a day, oftener if the quantity of gravel is very large, and the sluices cleaned up immediately, as a precaution against robbery. The gold being, as a rule, coarse and heavy, requires no quicksilver to save it, a little is sometimes placed in the lower boxes to assist in securing fine particles of gold, that might otherwise float off.

Immigration Association of California.

Persons intending to come to California, and desiring information concerning various parts of the region, can, by writing to the above-named association, receive such information, with reference to land, climate, soil and productions, as may be useful to them. The association is incorporated under the laws of this State. It has no connection with any land or other private scheme, its object being solely to exercise an influence on the immigration into California, and to aid in a proper development of the State.

It is the intention of the association to obtain and disseminate such information as can be obtained from reliable sources in reference to lands which may be profitable; climate, character of soil and its productions; opportunities for obtaining building material and fuel; water supply, transportation facilities; location with reference to markets, towns, schools, etc., and any and all practical information (with maps and statistics of California) which may be beneficial to immigrants seeking homes; to have the same compiled and published in different languages, when necessary, and distributed in the States east of the Rocky Mts., and in Europe.

The Directors of the Association are: Arthur R. Briggs, President; Wm. L. Marry, Vice-President; W. Stsinhart, Treasurer, and James R. Kelly, James Duffy, Wm. Blanding, W. N. Hawley, T. L. Barker and J. V. Webster. The Secretary is Col. A. W. Preston, and the Land Officer is C. H. Street. The office of the Association is No. 10 California, a short distance from the ferries, California opening into Market near the lower end of the latter street.

People coming to California who expect to engage in mining, must not expect to come here and find a mine in a day or two; nor when they find a "ledge" can they make a living out of it without the expenditure of time, labor, and some money. Nor are mines to be found everywhere. The older counties, such as Nevada, Placer, El Dorado, Tuolumne, Calaveras, Amador, Yuba, Sierra, and Plumas, have been pretty well run over by miners for 20 years. To get mines in those regions, people have to buy them. True there are hundreds of "prospects" which will become mines only when a good deal of work is put on them. Hundreds of such claims may be purchased cheap. In the lower counties, such as Mono, Inyo, San Bernardino, Kern, Tulare and Fresno, there is yet considerable ground only partly prospected; and even in the first-named counties, of course, mines may be struck.

There is now no sharply-drawn line between agricultural and mining counties. In nearly all the mining counties, more or less, agriculture is carried on. In many places mining and farming are done side by side. In the valleys of all the mining counties fruit, vine, vegetables or grain are grown. Men who come to mine here now, however, cannot do as in early days, when pan and rocker made fortunes for their owners in a short time. Now, diligent labor is required,

Mines and Mining in 1881.

A Review of the Reeults of Work for the Year.

Never before in the history of the conntry has thers been a year so marked for advance in the mining industry as that of 1881. This is not so mucb noticeahls in the hullion product, for 1881 only exceeds 1880 by $4,366,481; but in ths increase of area of ths territory nndsr process of dcvelopment. Idaho, Montana, Arizsna and New Msxion ars all widsning their fields of labor. Some of the camps in thsse rsgions have very much increassd in importance within the year, noticsahly, Tombstsns, Butte and Wood River.

Up tn within the past fsw years ths States nf California and Nevada have ovsrshadowsd all the others in the mining intcrests. Now thsse twn States ars hy no means so much ahsad of others. Coloradn heads ths list, California coming second and Nsvada third.

It ie as well at tbis time to oall attention to the faot tbat a great deal has been written abont Idaho, Montana, New Mexico and Arizona, wbicb depioted mining matters in those Territories as they will be rather than as they are. It might have been supposed by many that California, for instance, was a played-out mining region. Yet results show that she is seven millions ahead of the State below her, which is hetween two and three millions ahead of the next one below. This, for a played-ont State is pretty good. Moreover, California last year did not have a fair chance, eince many of her largest hydranlic minee were closed down hy injunction a part of the time. In fact, the only thing we have to deplore for the period under review is the unfortnnate litigation shont the debris qnsstion. The great suit now going on will soon he settled, however.

The Bullion Product.

As a matter of interest, we append a tablo, which we get from the Superintendent of the U. S. Branch Mint, in this city, showing the hullion product for the *fiscal* year ending June 30, 1881:

	Gold.	Silver.	Total.
California	$17,295,323	$757,525	$18,742,848
Nevada	2,534,792	7,776,818	10,311,610
Arizona	554,517	7,796,306	8,350,823
Idaho	1,541,652	1,068,916	2,620,568
Oregon	753,613	79,671	823,284
Washington	90,000	.....	90,000
Alaska	1,900	.....	1,900
Totals	$23,462,797	$17,479,236	$40,942,033

A peculiar significance of thie table lies in the fact that it is made up of figures from the actual returns made hy mine owners to the Superintendent of the U. S. Mint. It is, therefore, free from "estimates," which may he more or less carefully made. We are cognizant of the very great care taken hy the gentlemen in charge of the statistical department of the mint, to get all the details of hullion product in the most accurate manner. Therefore the tables compiled by them are made on information of the most reliable character.

For the hullion product retnrns this year we are indehted to Mr. John J. Valentine, General Superintendent of Wells, Fargo & Co., who compiled the tahles we gave last week and which we repeat below:

Statement of the Amount of Precious Metals Produced in the States and Territories West of the Missouri River, including British Columbia (and Receipts in San Francisco by Express from the West Coast of Mexico), During the Year 1881.

States and Territories.	Gold Dust and Bullion by Express.	Gold Dust and Bullion by other conveyances.	Silver Bullion by Express.	Ores and Base Bullion by Freight.	Total.
California	$16,349,215	$817,400	$348,582	$3,5,421	$18,090,679
Nevada	35,446		7,755,774	3,806,428	11,847,564
Oregon	660,931	580,000	45,684		1,189,615
Washington	67,360	13,000			100,063
Alaska		33,554			13,000
Montana	1,066,540	417,239	500,540	1,007,365	2,991,684
Idaho	1,166,240	116,336	2,965,729	1,007,365	4,854,474
Dakota	98,959		3,963,610	3,637,383	7,699,952
Colorado	1,907,160	325,000	2,920,000	18,230,000	23,382,160
New Mexico	32,944	137,252	77,000	705,000	952,196
Arizona (west coast)	3,295,940				3,295,940
Arizona (Mexico)	348,127		1,578,805		1,926,932
British Columbia	757,600	115,000	1,209,215	1,301,000	3,382,815
	$16,349,215	$817,400	$348,582	$3,5,421	$18,090,679
	35,446		7,755,774	3,806,428	11,847,564
	660,931	580,000	45,684		1,189,615
	67,360	13,000			100,063
		33,554			13,000
	1,066,540	417,239	500,540	1,007,365	2,991,684
	1,166,240	116,336	2,965,729	1,007,365	4,854,474
	98,959		3,963,610	3,637,383	7,699,952
	1,907,160	325,000	2,920,000	18,230,000	23,382,160
	32,944	137,252	77,000	705,000	952,196
	3,295,940				3,295,940
	348,127		1,578,805		1,926,932
	757,600	115,000	1,209,215	1,301,000	3,382,815
	$26,019,223	$2,663,910	$27,567,824	$30,233,430	$84,004,417

Compared with the report of the same anthority for 1880, California showe a decrease in gold of $579,069, and an increase in silver of $323,-582. Nevada shows a total falling off of $3,-184,057; the yield from the Comstock being only $1,726,162, as against $5,312,592 in 1880—a decrease of $3,586,430. The prodnct of Enreka district is $4,127,265, as against $4,639,025 in 1880—a decrease of $511,760. Utsh shows an increase of $860,335. Colorado shows an increase of $1,672,171; and Arizona $3,726,395 ovsr tbe report nf last year.

Annual Products of Lead, Copper, Silver and Gold in the States and Territories West of the Missouri River, 1870-81.

Year.	W. F. & Co.'s Statements, including Amounts from British Columbia and West Coast of Mexico.	Product after deducting Amounts from British Columbia and West Coast of Mexico.	The Net Product of the States and Territories west of the Missouri River, exclusive of British Columbia and West Coast of Mexico, divided, as as follows:			
			Lead.	Copper.	Silver.	Gold.
1870	$54,600,000	$53,150,000	$4,687,000		$17,330,000	$33,750,000
1871	58,284,000	55,784,000	2,100,000		19,236,000	34,388,000
1872	62,226,369	60,351,324	2,250,000		19,924,429	38,177,395
1873	72,218,693	70,139,860	3,450,000		27,483,302	39,206,558
1874	74,401,045	71,985,610	3,500,000		30,699,122	38,456,883
1875	86,078,425	83,703,425	5,040,000		37,289,924	41,373,501
1876	90,687,167	87,276,167	3,452,000		42,888,038	41,936,129
1877	99,431,754	95,811,892	5,085,250		44,616,109	44,880,223
1878	81,154,622	78,276,167	3,452,000		37,248,137	37,576,030
1879	75,319,501	72,683,883	4,185,769		37,032,857	31,470,262
1880	80,167,936	77,232,512	5,743,390		38,033,064	33,456,059
1881	84,904,417	81,198,474	6,361,502	$806,000	42,387,613	30,639,359
				1,196,000		

We give, in other parts of thie review, the reports of hullion product from varione localities.

California.

Ae we devote from two to three columns per week to condensed statements of the progrees of the different counties of the State as regards mining development, it would scarcely be possible for us to give in readable space, in a general review of this character, a statement of the condition of the various mines in the different connties, moreover it is exceedingly difficult to ohtain reliahle statietics nf yield by counties. There are so many companies in this State that are nnwilling to have the detaile of their hnsinsss made public that we have consequently given up any attempt to give detailed yields by conntiss. It would be mere guess-work half the time, and we prefer to give only the aggregate amount as shown hy the hullion shipments made through the express company.

The following table shows, with the authorities, the total yield of precious metals in California from 1848 to Jan. 1, 1882:

Precious Metals in California.

Year.	Amount.
1848 }	$15,000,000
1849 }	
1850	45,000,000
1851	75,000,000
1852	85,000,000
1853	75,000,000
1854	65,000,000
1855	68,500,000
1856	65,000,000
1857	57,600,000
1858	50,000,000
1859	50,000,000
1860	45,000,000
1861	40,000,000
1862	34,700,000
1863	30,000,000
1864	26,600,000
1865	28,500,000
1806	25,500,000
1867	25,000,000
1808	22,000,000
1869	22,500,000
1870	25,000,000
1871	19,679,224
1872	19,050,098
1873	18,025,722
1874	20,300,531
1875	17,758,151
1876	18,615,807
1877	18,174,716
1878	18,920,461
1879	18,190,973
1880	18,270,166
1881	18,020,679

	Gold.	Silver.
1848 to 1857, Garnett	$ 548,100,000	$ .....
1858 to 1870, Raymond	424 800,000	.....
1871 to June 30, 1881, Valentine	190,096,076	14,914,452
	$1,162,992,076	$14,914,452
	14,914,452	
Total	$1,177,906,528	

This makes an aggregate of nearly 1178 millions.

Soms few points rsgarding the prominsnt mining regions shonld he tonched npon, however.

If we take ths last report of the Director of the United States Mint ss a basis—and we havs no othsr sonrce for informstion of yisld hy counties—Nevada yields the hannsr to Mono. According to his statistics, in 1880, Mono yialded $2,990,-141, while Nsvada county yielded $2,722,506. This was ysar hefors last, hut the stoppags of many hydranlic mines in Nevada conty must have redncsd ths yisld this ysar. Notwithstanding, that conuty, Nevads, is in a prosperons condition, more sspecially its qnartz mining interests. Ths *Transcript* says:

Ths quartz mining interests of Nsvada county are in a most sncouraging condition. In this district, hy which we mean Nevada township, nearly 200 stamps are dropping, and ths nnmhsr is heing iucreassd from month to month. The numerons live enterprises, old and new, that are adjaoent to Grass Valley, ars mostly prospering, and several nsw prodncsrs will hs opened there alsn before many months. In all other parts of the county, where anriferous qnartz deposits shonnd, the same indicatione of activity in this hranch prevail. Even the Meadow Lake conntry is gradually passing from under the clond that has hung over it so long, and hefore lnng, we hope to chronicle that the ores there, which have heretofore proved so rebellions, are yielding up their treasnre at the touch of science. The drawhacks that hesst hydraulic mining will he removed soon, we trust. The scarcity of water this winter is not satisfactory, hut onr people are hopeful, and find consolation in turning their faces towards the near futnre, which is hright with hope.

In this county ie the representative gold mine of this State—the Idaho mine. We gave, not long since, the annual report of the mine, ehowing some very interesting figures. For something over 13 years, the mine has been paying regular monthly dividends, having in that time dishnrsed to stockholders $3,101,550, out of a gross product of $6,780,295.60; the total number of dividends heing 148, in value to 1000½% upon the capital stock. The past year has hean one of great prosperity with the mine, heing the hest since 1874, and the third hest since the mine commenced paying dividends. In 1873, the product was $1,010,612 20; in 1874 $669,023-.03, and in 1881, $640,107.58. The prodnct of 1881 was $199,761.59 greater than the yield of 1880, showing improved condition of the mine in its deepest workings, which have extended down to the 12th level, over 1,500 ft. on the incline and over 1,300 ft. in perpeudicular depth. At these depthe the ledge has continned to hold its average width, and has decidedly improved in quality, as shown hy the yield of the ore for 1881, the average per ton heing $22.95½, as against $15.82 per ton for 1880; while the average cost per ton for mining end milling has hut slightly increased, hsing $9.29½ per ton in 1880, and 9.51 1-9 per ton in 1881. All the profitable ores of the mine for the past year have heen from the No. 11 and the No. 12 levels, and the stopes connected therewith, as the levels ahove are nearly exhausted. The history of this mine is sufficient to demonstrate the value of the mineral resources of the district.

Bodie district, in Mono county, vies with Nevada conuty in hullion yield. It is hardly worth while for us to go into any detaile concerning its mines, in view of the fact that we have presented each week the current news. As to yield of hullion, the *Free Press* of the 10th inst said: It will perhaps he a surprise to many of our readers, hut it is nevertheless a fact, that the hullion shipments from Bodie dnring the year just closed were the largest of any year since the revival of the district. They amounted to the sum of $3,173,000. Thie is an increase of more than $100,000 over those of 1880, of more than $600,000 over those of 1879, and of more than $1,000,000 over those of 1878, which was the year of greatest excitement in Bodie mines. The shipments for the five years ending Decemher 31, 1881, have been as follows:

1877	$ 973,022 80
1878	2,129,722 53
1879	2,556,847 58
1880	3,063,699 13
1881	3,173,0.0 00
Total	$11,952,302 09

Before the middle of the present month Bodie district will have made the grand record of $12,000,000, added to the permanent wealth of the world. We are of the opinion that the yield of the present year will he fully equal to that of 1881, and there is good reason to anticipate that it will he larger. The prospects of opening up a new honanza are exceedingly good, particnlarly in the south end of the camp. Outside districts in the neighhorhood of Bodie are attracting much attention, and more activity than usual is anticipated in Homer district during the coming eeasons, where several new combinations of capital will enter into mining operations. The Sweetwater minee, ahont 20 miles north of Bodie in an air line, it is confidently predicted, will create a furore of excitement during the present season. Dr. Summers' mill started np on rich ore on Monday. The Aurora mines will have an opportunity of making a stir under the impetus of milling facilities, as the Humholdt mill will be in operation before the end of the present month. Altogether, there is every prohability of an unusually hrilliant year in mining in Bodie and the surrounding country.

Up in El Dorado conuty they ssem tn hs prstty wsll snconraged in thsir work. The Gsorgetown *Gazette* says: The ontlook for this divide during the nsw year is qnite encouragiog. A number of enterprises ars in vogus, which will give employmant to many of our laborers, and add materially to our financial condition. Ths mining ontlook is certainly hrighter than it has been for years, particularly quartz mining. No less than 30 qnartz locations have hssn recorded in this district alone during the past year, and locations ars still heing made. The Cal. W. & M. Co. continuss to carry forward its great work of permansnt improvements npon its ditch property. Kelsay, Garden Valley, Grssnwood and Volcano districts, ars all making progress in ths quartz mining industry. Thess districts have all added new mills, and started np idle onss within ths past year, and we hear of more mills and mining machinery which are to hs added to all of those mining districts within ths nsxt six months. The mines of Spsnish Dry Diggings continue to hold their own. Georgstown district is not bshind, in fact present indications are that this district will stand ehead of any in the county hefore the close of 1882. The *Mountain Democrat*, of the same conuty, says: Business, on the whole, is hetter than it has been for many years. The mining induetry especially ie greatly revived. More quartz mills and hoisting works have been put up within the past year than within any other year since the conuty was organizsd, and the numhor of new mining enterprises started within the year, is without a precedent.

Of Placer county, we have had considerable to say of late, and refer the readers particularly to a letter from Russel L. Dunn, published in a recent issne, giving many intersating facts concerning the county. In his testimony hefore the Superior Court of Sacramento county, in the case of the People vs. the Gold Run Ditch and Mining Co., J. B. Hobeon, a miner of Iowa hill, testified in reference to the extent of the mining operations in that district, and the yield to date of various Iowa Hill mines, as follows: There has been mined into the North Fork, above Rice's hridge, 3,585,800 cnbic yards of material from the Iowa Hill mines—ahont 31 acres. At the mine on Independence hill, during the three seasone, we worked 278 days, and nsed 500 inchee of water. We took out $66,529. The expenses of the mine were $35,450, and the net proceeds, $30,977. The following amounts have been taken out in thet vicinity: North Star and Weisler claim at Iowa Hill proper, $2,000,000; Wolverine mine at Roach Hill, $800,000; Shelhy, $105,000; Columhus, $100,000; Dayton, $156,000; Phillips, $80,000; Morning Star mine at Morning Star Hill, $250,000; Bird's Flat mines, $200,-000; Strawberry Flat, $100,000; Wisconsin Hill, $550,000; Grizzly Flat mines, $350,000; Sucker Flat, $250,000; total from Indepsndsnce Hill mines, $100,000; Mountain Gate at Damascus, $1,500,000; total, $6,541,000. The production of the Mountain Gate mine at present varies from $3 to $5 per load—ahout $40,000 per acre.

The Placer *Herald* says: The amount of gold dust shipped through the office of Wells, Fargo & Co., at Auhurn, for the year 1881, aggregates $281,379. This all came direct from the mines, and is so much added to the circulation of the world. It is not as though this much had heen taken from one channel of trade and put into another, hut it is this much that never existed in circulation hefore added to the channals of all classes of trade. It would not seem from this showing that the minee were entirely worked ont. On the contrary, it is donhtful whsther the gold product of this part of the country has for a number of years exceeded the annual yield indicated hy these figures.

The Calaveras *Chronicle*, published at Mokelumne Hill, in spsaking of the region thereahout, says:

While we do not expect to experience the animation of '52, yet to an approximate degree we opine that this dull, quiet, little hurg, Mokelumne Hill, will, within the next year or two, become again the center of great mining notivity. The class of mining that made us what we were, viz., placsr, will not in the fnture, as hefore, he the only feature. Quartz mining ie destined to become the etrong lever that will raise our almost razsed town to its old-time quarters. The oldest inhahitant has long known, and the world at large is coming to know, that our hig county, with its 1,100 square miles of territory, the greater portion of which embraces mountain ranges composed of gold-hearing formations, is traversed hy a network of auriferous quartz ledges, not numhered by the score, but hy hundreds. These mountains are not harren, desolate hills devoid of timher and water, those great essntials to profitahle mining.

As to the healthfulness of this region, the glorious climate of California, of which everyhody has heard, settles that question. Railroad facilities heing good, the most remote of our mines are within one day's journey of the great metropolis hy the sea. Substantial wagon roads, already constructed, make accessible every part of the county.

Nevada.

The yield of Nevada last year, $11,847,564, shows a total falling off of $3,184,057; the yield from the Comstock hsing only $1,726,162, as against $5,312,592 in 1880—a decrease of $3,-586,430. The prodnct of Eureka district is $4,127,265, as against $4,639,025 in 1880—a decrease of $511,760. If we remembsr aright this is the lowest yield of the Comstock eince

its discovery. In 1880 the Consolidated Virginia mine alone yielded $1,756,536, which is more than all the mines in the lode turned out in 1881; in addition, the California produced $890,515, the two mines yielding an aggregate of $2,647,151. This is the second year only when Nevada has not been the leader in bullion product for many years and it is even now third, following California and being over three millions and a half ahead of Arizona, which comes next to it. This, for what some people wrongly suppose to be a played-out mining State, is very good.

The great need of Nevada at present is a means of working low-grade ores. There are thousands of tons of such ores all over the State, and more particularly on the Comstock, but by processes at present known it is impossible to work them at a profit. They contain, however, sufficient metal for a profit if worked at a low price.

The extent of territory within the Nevada borders, nearly all of which is mineral-bearing, precludes the possibility of our mentioning the various districts. The Comstock and Enreka are the two principal ones. There are, of course, very many others, which we have mentioned from week to week in our "Mining Summary." The extension of railroad facilities is gradually bringing into notice and prominence several camps, which promise abundant returns for investments.

We have before given the yield of Nevada for 1881, and the following table will give an idea of the sources of this yield. This table shows the results of mining product for 12 months, ending September 30th, 1881, and is that from which the tax levy is based. Although it only comes up to September 30th, it gives a good idea of the comparative yield of the different counties. For once Eureka county is ahead of Storey (where the Comstock mines are).

COUNTIES.	Quantity Worked. Tons.	Lbs.	Gross Yield or Value.	Net Yield on which Taxes are Levied.
Ores.				
Elko	3,333	1,473	$321,906.08	$64,344.35
Esmeralda	37,398	1,297	1,490,457.42	406,898.79
Eureka	77,005	191	3,168,343.91	918,655.94

The above report will seem altogether unfavorable, except an explanation is given: In 1877, $42,295,076.05 was mostly from the Comstock. It was when the great Consolidated Virginia was doing its best. Mines outside the Comstock, we think, although we have not the exact statistics, have not fallen off in the amount of product, but increased, both in the gross yield and the net profits. As heretofore the greater efforts have been toward the Comstock, and that those famous mines are experiencing a comparative dark day, it is not wonderful that a wide showing should be made between the amount of bullion produced in the State when the Comstock produces largely and when but little. Mining in Nevada generally is gaining in interest, and although the yield the last year falls greatly below that of some previous years, the Comstock is liable at any time to resume her former status, which, with the increase of other camps, will carry the grand product far ahead of any year in Nevada's mining history.

Eureka this year takes the lead. The *Sentinel* points, with gratification, to what has been done in the two mines that have been most prominent in the history of Eureka district so far. The Eureka Con. has disbursed, in dividends, $4,705,000. The payment of dividends was suspended Nov. 1st, and the surplus funds on hand retained to pay for improvements that are being made—the sinking of a new shaft and the erection of new, extensive and costly works. The Richmond company has paid dividends up to the present, aggregating $3,564,000. This company also has a substantial reserve fund to meet all demands. The Geddes & Bertrand mining company is engaged in the construction of very extensive works to develop its property, thereby indicating its faith in the value of the mine. In many other mines a vast deal of important work has been done. Numerous strikes have been made during the year, all going to confirm the belief in the richness and permanency of the camp. The developments in the Eureka tunnel have done much to further strengthen this opinion, while the late discoveries in Prospect Mountain tunnel have well nigh turned speculation on the subject into settled belief. These discoveries have cheered the miner and given new life to the prospector. Work has been renewed on many old claims, and new ones have been opened. Unfortunate litigations have vexed the principal industry somewhat, but this trouble is an universal concomitant of mining

During the year a new railroad has been commenced, with Eureka for the construction starting point, and with Salt Lake as the present proposed terminus, but at which point it will become a part of one of the projected transcontinental trunk lines. That the building of this road is a bona fide enterprise, there seems to be no doubt. Vigorous work on this road is going on at present, at considerable expense, notwithstanding the inclemency of the season.

On this Comstock they are working away in hopes of finding a bonanza. The great bonanza mines, as they are called, found no extensive or rich bodies of ore either in 1880 or 1881. Vigorous prospecting has been carried on, however, not only in these two mines, but in the other more prominent ones on the lode. To show the expensive nature of the work going on, it is only necessary to quote from the report of one or two mines for the year.

The famous California mine, for the year ending Dec. 31, 1881, turned out 6,175 tons of ore, yielding bullion to the value of $122,107.26, or an average of $19.77 per ton, milling 79% of assay value. There was gold in bullion to the value of $82,146.10, and silver to the value of $39,961.16. There were raised 13,299 tons of waste rock. All the work done was of a preparatory nature. The following figures show receipts and expenditures of the mine:

RECEIPTS.

Bullion on hand at last annual statement	$ 34,359 03
Cash on hand at last annual statement	903.42
Samples on hand at last annual statement	65.92
Gross product of mine for 1881	122,182.32
Assessment No. 1	162,000.00
Overdraft Jan. 18, 1882, at Nevada Bank	74,630.25
Total	$394,140.93

DISBURSEMENTS.

Overdraft last annual statement	$ 9,804.50
Salaries and wages	55,580.76
Supplies	30,381.47
Hoisting	16,006.63
Compressed air	6,097.50
Sutro tunnel royalty	3,658.30
Suction fan	3,766.11
Assaying account	745.88
Team account	148.75
Taxes	2,856.14
Pumping expense	755.00
Bullion freight	465.20
Virginia City expense	1,330.08
C. and C. joint shaft	126,200.00
Real estate Virginia City	1,325.00
Interest and exchange	6,027.02
Legal expense	11,923.80
Advertising	4,657.25
Discount on bullion	10,104.91
Refining charges on bullion	994.74
San Francisco office expense	3 757.55
Books and stationery	580.20
Cash on hand	1,174.52
Samples on hand	14 36
Total	$394,140.93

The Consolidated Virginia mine turned out 6,435 tons of ore in the year, yielding $144,-064.10 or $21.13 per ton. There were also 8,-307 tons of waste rock taken out. In our last issue we gave a summary of the work done in this mine, and now append tables showing the receipts and expenditures:

RECEIPTS.

Dec. 31, 1880, cash on hand	$ 1,569.50
Samples on hand	154.40
Assaying	6,284 19
Supplies	11 382 33
Best & Belcher joint work	14 023.94
Drafts on secretary	320,365.05
Samples produced	104.40
Suction fans	13,303.10
Total	$367,792.98

DISBURSEMENTS.

Salaries	$ 6,000.00

Interest and exchange	1,373.56
Transportation and hauling	1,455.85
Best & Belcher joint winze	777.35
Suction fans	15,675.41
Samples shipped	258.87
Compressed air	2,069.50
Cash on hand, Dec. 31, 1881	1,980.87
Total	$367,792.98

As to cost of sinking deep shafts on the Comstock, it will be well to note the cost of the C. & C. shaft during the year. This was in January, 1880, about 194 ft. below the 2300-level, and had been sunk (the first of this month) 33 ft. below the 2500 level. A large sump drift has been run out a distance of 50 ft. from the bottom. Stationary double plunger pumps have been put in at the 2400-level and 2500-level, with the necessary balance-bobs and tanks to complete the main pumping system to that level.

To do this work cost $377,200, as will be seen by the following record of disbursements for this shaft for the year:

Office supplies and repairs	$ 1,418 19
Miscellaneous supplies	28,460 38
Candles	5,736 70
Powder, caps and fuse	18,977 50
Timber	19,890 24
Wood	106,671 99
Oils	4,364 08
Ice	24,724 35
Water	9,690 00
Wire cable	2,373 44
Salaries	1,800 00
Wages	112,125 34
Real estate	750 00
Team expense	77 00
Contribution account	90 00
Interest and exchange	333 86
Taxes	4,073 53
Pumping	10,037 50
Surveying	1,800 00
Legal expenses	20,410 50
Transportation and hauling	3,027 10
Balance cash on hand	457 70
Total	$377,200 05

The following, from the White Pine *News*, shows the bullion shipment from Cherry Creek, Nevada, through Wells, Fargo & Co.'s office for the year ending December 31, 1881, the December shipment being pretty closely approximated:

January	$ 23,020
February	33,072
March	23,040
April	39,490
May	41,685
June	39,757
July	32,700
August	27,150
September	25,465
October	21,950
November	31,367
December	33,000
Total	$375,680

Of this amount the Star shipped $363,031 91, the balance coming from the Exchange, Teacup, Silver Canyon, and Schellburn.

The shipments of Tuscarora bullion for the year 1881, as furnished by the books of Wells, Fargo & Co. at that place, are given as follows:

January	$ 25,025 04
February	39,224 76
March	97,590 00
April	31,276 13
May	20,745 43
June	24,028 28
July	16,888 63
August	69,972 90
September	14,091 00
October	9,146 01
November	37,207 14
Total	$387,196 34

With the December shipments already made, and those to come, it is estimated that the amount will reach a total of $422,396.

The Grantsville *Bonanza*, speaking of that section, says: In Nye county the outlook was never more promising. Downeyville has shaken off her letbargy and will again fall into the ranks as a bullion producer. Her mines are improving as work progresses and the ore encountered is of a high grade. Ellsworth, after a sleep of several years, is showing signs of activity, and it is confidently expected that the Esta Buena company will be shipping bullion before the first of June. The prospects of this company are excellent. Operations will also be resumed in the Mount Vernon, a mining property of more than ordinary promise. The now dead camp of Lodi is expected soon to show some signs of vitality, as a valuable mine there will probably pass into the hands of capitalists. Gold Park, the new venture of Messrs. Cooper and San Pedro, contains some of the most promising mines in Nye county. The ores are chiefly gold and are rich. Here in Grantsville things at present are very quiet, but the people are hopeful. The mines are known to be rich in mineral, and the Alexander, at the time of shutting down, never looked better. It is one of the biggest mines in the State, and has produced in the neighborhood of $1,500,000. There are immense quantities of ore in sight, and when operations are resumed a straight shaft will probably be sunk for the more effective working of the mine. There are numerous other mining locations in and around Grantsville that only require capital to develop into valuable properties; in fact, it is acknowledged by all mining men who have visited and examined the mines in this district that there is no richer mineral belt in the State, the ore deposits being simply immense. In Washington and San Juan canyons there are also some valuable mines, and from some of these the ore is being shipped to Salt Lake for reduction. In the mines around Ione nothing is being done at present, but strong hopes are entertained that operations will be resumed in some of them during 1882. In Ophir canyon there are some valuable mines. In Jett canyon there are some promising mines that have never been properly handled. The mines of Jefferson are known to be rich in mineral and have produced considerable bullion, but mismanagement and stock manipulation have operated against them sadly. Some little work is being done in the district, and it would not be at all surprising to see operations resumed in that once flourishing camp before the close of 1882. Nye is one of the richest mineralized counties in Nevada, and all that is required to demonstrate this fact beyond the peradventure of a doubt is capital to operate the closed-down mines and open up properly those that are now being worked.

As we have before stated, it would be impossible for us to itemize all the news of interest in various parts of Nevada. Our "Mining Summary" has given each week the correct news of the districts. The Carson and Colorado railroad is going to open up a considerable mineral country. Esmeralda district, with its many mines, has not made a very great showing this year, but this is more owing to the lack of capital for development than the poverty of the mines themselves. Many other districts in the State are in the same straits, and Nevada will not be likely to get any very great "boom" until a bonanza in the Comstock again draws attention that way, and men begin to look after the other promising districts.

Colorado.

Colorado ranks all the States and Territories this year as a bullion producer. The Denver *Tribune* presents a statement of the bullion product of Colorado by counties for the year 1881, showing a grand total of $22,680,900, an increase of $859,000 over 1880. Lake county, in which the famous Leadville district is located, is credited with $13,502,000 by that paper, while Clear Lake county is credited with $2,-205,000, Gilpin county $2,150,700, and Summit county $1,820,000. Fourteen other counties figure in the list, the three most noteworthy being Bowlder, Custer and Gunnison, the aggregate yield of which was $1,679,300, about equally divided. The product of Leadville is given by the Leadville *Herald* at $13,170,600, in quarterly statements, as follows:

First quarter	$ 3,097,800
Second quarter	3,404,000
Third quarter	3,170,300
Fourth quarter	3,498,500
Total	$13,170,600

The sources of the value for each quarter are given. The Leadville *Democrat* puts the same information in a different form, by not only giving the sources of the bullion, but the number of mines from which it was taken and the descriptions. The total coin value of the product of 131 Leadville mines is given by the *Democrat* at $13,100,800. The difference between this and the *Herald* total is not of much importance, but there is a wide variation in the details. The yield of metal was 11,135 ounces gold, 7,174,234 ounces silver and 74,409,217 lbs. lead. Last year the *Democrat* reported the coin value of the gold, silver and lead produced by the Leadville mines at $15,095,200. The decrease of $2,000,000 for the past year is not encouraging. The yield of the Leadville camp has been remarkable. The total for the past five years has been as follows:

In 1877	$ 555,300
In 1878	3,152,900
In 1879	10,189,500
In 1880	15,095,200
In 1881	13,100,800
Total	$42,093,700

The camp has only come into prominence during the past four years. Up to the close of 1876 the total yield has only been a little over $6,-000,000. The product for the past two years has exceeded that of any other mining camp in the whole country.

The list by counties is as follows:

County.	Total.
Bowlder	$335,482.83
Chaffee	100,000.00
Clear Creek	2,204,980.00
Custer	608,519.37
Dolores	125,000.00
Fremont	14,536.50
Gilpin	2,165,760.00
Grand	10,000.00
Gunnison	535,033.00
Hinsdale	187,375.00
Lake	13,502,029.00
La Plata and San Juan	40,000.00
Ouray	78,000.00
Park	350,000.00
Pitkin	120,000.00
Rio Grande	251,000.00
Saguache	40,000.00
Summit	1,828,000.00
Grand Total	$22,680,685.00

It is as well to state that these figures include gold, silver, copper and lead.

The Georgetown *Courier* has been furnished with the following statements of the 1881 business from Colorado smelting works:

BOSTON AND COLORADO WORKS, ARGO.

Counties.	Gold.	Silver.	Copper.	Total.
Gilpin	$398,000	$ 76 000	$ 89,000	$ 563,000

Oth'r source	449.36	2,088.98	782 40	3,320.74
				$604,906.35

Total No. of tons, 8,081.
Tons bought in 1880—5,012; value, $586,044.26.
Tons bought in 1879—3,006; value, $310,962 09.

The following table represents the amount of ore purchased by the Miners' Smelting and Reduction Co. since commencing business in May last. In a few weeks their furnace capacity at Golden will be doubled, and in consequence ore purchases will increase in proportion:

County.	Gold.	Silver.	Copper.	Total.
Gilpin	$ 58,833.61	$ 11,734.00	$7,063 00	$ 78,230.61
Clear Creek	35,305.00	184 000 85	11,000.00	230,911.85
Oth'r source	6,159.00	7,100.00	12,433.00	25,695.00
Totals	$100,297.61	$202,840.85	$31,690.00	$334,837.46

According to the figures given above of bullion production by counties the total is $500,000 short of last year. Lake falls short $1,500,000; Clear Creek, $800,000; Gilpio, $500,000; Bowlder, 250,000; Custer, $200 000, and Park $50,000. Summit has gained $1 400 000; Gunnison and Pitkin, $900,000; Chaffee, $50,000, and the San Juan country, $700,000. The total output of the mines falls short of expectations, yet the results are very satisfactory. A number of the once heavy producing mines of Lake, Gilpin and some other counties have taken out very little ore for various reasons.

From a comprehensive article in the *Rocky Mountain Mining Review* we condense the following facts, which summarize the condition of the mining industry in the counties of the State:

The mining interests of Clear Creek county have continued about the same during the past year as for 1880. More successful work has been done in the vicinity of Idaho springs than heretofore, and the production in that quarter is larger than heretofore. The mines about Georgetown are not, as a rule, doing as well as formerly. The output of Clear Creek county will be about $2,800,000.

Gilpin county is the old reliable gold-producing county of the State. Notwithstanding the fact that several of the mines worked in past years most successfully have been practically idle, and that work has been pushed for development only, the total output will be fully as large as for 1880, and possibly exceed it by a few thousand dollars.

Bowlder county has suffered during the past year to some extent a sort of reaction from her early boom. There are many good properties in this county, and some of them have been developed to a considerable extent. The output will be about $533,500.

In Lake county—Notwithstanding all that has been said about the mines of Leadville playing out, that camp still remains the leading producer in the State, and in all probability will retain that position for many years to come. The output of the Leadville mines for the past year, as nearly as can be ascertained, is $11,000,000. Several of the more extensive mines have been practically idle during most of the year, some of which it is now believed will resume work on an extensive scale early in the present year. There are many comparatively newly-discovered mines in the vicinity of Leadville that promise to become producers at an early date, and in fact that camp is the center of the richest mining country in the world.

In Summit county the Ten-Mile district has produced largely during the past year, and will probably continue to take out about the usual quantity of pay, even though the celebrated Robinson should prove a failure. This section is rich in mineral.

The balance of the county which added little to the output during 1880, is coming to the front with rich discoveries in all directions, and promises to become one of the best mining sections in the State. The production of Summity Co. will probably reach nearly $3,000,000.

Park county is coming into prominence with quite a boom. Many good mines have been discovered and worked within the past year; two smelters have been built, and abundance of capital has found its way into that section to work the mines successfully during the coming year.

Gunnison county has all the prospects of becoming at no distant date one of the best producing counties in the State, but at present her mines are mostly in the prospect condition. We estimate her product for the year at $150,000.

Dolores, the new county, has many good properties and some of extraordinary richness. Through lack of facilities for treatment and the great expense and difficulty of shipment, the output will be small.

Chaffee county, comprising within its boundaries 1,189 square miles, with a population of 10,000, has much good mining country and a great deal of work done in the way of development. The output for 1881 will be about $150,000.

Ouray county has suffered with the balance of the San Juan through lack of means for treating its ores. We give the output for 1881 at $80,000.

Custer county has taken out more ore than last year, and the mines are in better condition. We estimate the output at $1,500,000.

Saguache county has a number of valuable mines, but development work is just fairly beginning, and the cost of shipment is so great that the output will not exceed $62,000 for 1881.

Rio Grande county will output about $385,000 for the year. The mines are good, but work is needed upon them, and facilities for treatment are lacking.

Hinsdale county. The mines here also are comparatively new though they give promise of great richness. The output will be $125,000.

Oregon.

The State of Oregon is credited this year with a yield of $1,189,615, all of which was gold, except $48,684. Oregon, in 1880, produced $1,059,644, so that this last year its production shows an increase which, though not very much, is satisfactory, as proving that recent developments in different parts of the State have been profitable.

Eastern Oregon is just in a transition stage from a placer mining section to a quartz producing region. It comprises, says the *Oregonian*, the five counties of Union, Grant, Baker and Wasco, all containing quartz ledges of various importance, and Umatilla, which has no mining except the Chinese rocker claims along the Columbia. Baker county has produced the largest value of bullion; Grant next, while Union and Wasco are known to have ledges of argentiferous galena, which have not yet been sufficiently developed to determine their value. Those of Union lie in the Eagle Creek range, which divides Wallowa valley from that of the Grande Ronde, while those of Wasco are on the headwaters of the Ochoco. Baker county has placer gold diggings on Burnt and Powder rivers and their tributaries, chief among which is Auburn creek, which at one time gave employment to over 2,000 miners. Strange to say, no quartz ledges of any width or specific value have been discovered on the headwaters of that stream. On Burnt river, about 30 miles from Baker City, is a new ledge, owned by Capt. J. C. Ainsworth, of Oakland, Cal., and Theodore Wygant and Capt. Joseph Myrick, of Portland, the latter gentleman being Superintendent. The Connor Creek mine is located on that stream, about 50 miles from Baker City, and is owned by S. G. Reed and John Faull, the latter being Superintendent. It is beyond doubt the best quartz ledge in the State, and is currently reported to have cleared $140,000 over all expenses in 1878.

The celebrated Virtue mine, formerly called the Rockfellow, is also located in Baker county, but has produced no bullion for several years, and its shafts are full of water. It has always been an expensive mine to run for that reason. The Rye Valley mine, at one time owned by Fiske & Thielsen, of this city, but now the property of a Boston company, is under the supervision of J. D. Locke, but we have no data of its output. Grant county contains a greater diversity of valuable minerals than any other county in the State, though the production of bullion is below that of Baker. The chief placer mines are on Canyon and Prairie creeks, both of which have paid enormously in the past 20 years. These diggings were struck by a party of prospectors from Yreka, Cal., who were bound to Boise Basin. Two or three of the wealthiest firms in San Francisco got their start in Canyon City, the diggings of which extend a distance of two miles down to John Day town. Every foot of this ground has paid enormously, and some of it has been worked half a dozen times over. Near Prairie City, on the opposite side of the John Day valley, irregular bodies of auriferous quartz have been found, easy to work and free from rebellious sulphurets. Over on Granite creek are several small ledges of antimonial silver, the best of which is the "Beagle," situated about three miles from the "Monumental," famed for its dividends of the Fenian persuasion. All this rock is cased in granite, which does not speak well for its durability, but the grade of ore is very high. Down in the John Day river, below the South Fork, are deposits of red manganese, which is used in the manufacture of gold and silver ware as a polishing agent. Carbonates of lead, carrying a small portion of silver, are also found in the extreme north end of the county, but no thoroughly developed ledge as yet exists—hence it is hardly fair to give this branch of mining any more than a passing mention. Small deposits of cinnabar have been found in the southern end of the county.

Southern Oregon Mines.

In southern Oregon mining is the great special industry. All the mines operated in Jackson county are placers, and at this season present the unsightly appearance of scare upon the country, very much resembling abandoned brickyards. There are several fine quartz ledges in the county, but to operate them mills must be employed, and none have yet been put in. Just what the annual yield of the mines here is, it is impossible to say. The dust is used as a circulating medium among the miners, part of it is sold at the Jacksonville bank, part is traded at the stores, part is shipped by registered package, part is shipped by express, and part is carried out by the miners themselves. The difficulties of the situation may be seen. Only in a general way we may say that the annual gold production of the county approaches half a million dollars, much of which finds its way into the hands of farmers and merchants of the county. Fully one-half of the men engaged in mining are Chinese, and one of the principal mining bosses and proprietors is a Chinaman. The mining season commences in November or December, with the winter rains, and lasts till May, the miners generally making enough during these months to keep them the rest of the year. Every process of water mining, from the old-fashioned rocker to the most approved hydraulic methods, are employed in these mines.

Mining is the great and almost the only industry of Josephine county. They are similar to the mines of Jackson. The annual gold production of the various districts in Josephine is estimated at $192,500.

The number of men engaged in these diggings is about five hundred, more than 250 being Chinamen. The various hydraulic methods are in use. The mines of Douglas county are mostly quartz, and are undeveloped. Very rich silver ore is found in several places, whose owners would like to sell.

For more than thirty years black sand mining has been carried on along the beach south of Coos Bay. The Lane mine was first worked sixteen years ago, and is now under the management of Mr. Baily, to whom it is leased. The works represent an investment of $25,000, and employ sixteen men. The Eagle company spent $50,000 in building works, etc., and after conducting a failing business for some time, sold out for $40,000 to a California company, who spent $25,000 more and then abandoned the claim. First and last a good deal of gold was taken out of the Eagle, but the business never was profitable. Miners working by hand along the beach have always made good wages, and some few have picked up fortunes. "Big Mac" took $100,000 out of the sand in a few weeks, spent it in a few months, and is now keeping a hotel in Crescent City. The town of Randolph, which is marked on the maps, exists nowhere else. It was once a thriving mining camp, but the sands shifted, the mines failed and Randolph died—died as only a mining town can die.

Arizona.

In the MINING AND SCIENTIFIC PRESS of the 17th ult., we gave a very full statement of mining affairs in Arizona. In that issue we gave a resume of what was going on in the mines there, a list of the mining districts, yield of prominent mines, descriptions of the country, etc. Having done this such a short time since, it is not necessary in this review to do more than add something to what has heretofore been said. Those of our readers who desire general information concerning the Territory, will do well to send for the number of the PRESS referred to.

The Territory has had a year of unprecedented prosperity, and we feel certain, it is only the first one of many to come. For years and years Arizona has been in the background through lack of facilities for transportation, which now being furnished, enables her to mine as other regions mine and not be kept stationary on account of her isolation. The output of ore has produced an amount of bullion which raises the Territory to fourth in the order of bullion production. It now ranks next to Nevada, with a strong probability that, with the opening up of many of its yet undeveloped districts it will attain a higher place in the scale.

The general product for the year we give in a table in the previous part of this article. The Yuma *Sentinel* of the 21st inst., speaking of bullion product, says: Accordingly, from her small output of less than $400,000 of gold and silver in 1875, its yearly output has been steadily augmenting, until it has reached, in 1881, over $9,000,000. The output for 1880, up to June 30th, was $2,400,000, of which $2,000,000 was silver. The gain from this last date to June 30, 1881, was $5,950,823, of which $5,796,306 was silver. These amounts are the authorized estimates, which, of course, do not include segregated small amounts not statistically reported. From no stamp mill in 1868, the increase has been to 55, of from 1 to 100 stamps each, aggregating 785 stamps, besides some 10 others that are now being put up.

The Arizona *Star*, in summing up the bullion product, says: The output of precious metals last year from Arizona did not exceed $4,000,000. For the year 1881, so far as heard from, the output has been $9,101,179.06. This does not include the output north of the Tiptop mine, nor that of the 80-stamp mill of the Vulture; nor Silver King concentrations, and the large quantity of high-grade ores shipped out of the Territory, all of which will, at a conservative estimate, add at least $1,000,000 to the total amount.

Tabulated, we give the following results:

Tombstone	$5,142,125.53
Silver King	1,800,000.00
Harshaw Co.	779,500.0
Ore from Harshaw District	46,000.0
Yuma and Mohave gold	64,000.0
" " silver	103,230.00
Tiptop	298,512.32
Dos Cabezas	27,862.81
Globe District, via Casa Grande	725,000.00
Total product of Pima county gold dust	40,159.00
Silver bullion, Pima	51,516.00
Galeyville	15,500.00
Making a total of	$9,101,179.66
To which add the value of copper	1,563,011.40
And from all other sources	1,000,000.00
And we have a total of	$11,664,191.00

Which, to say the least, is within bounds.

The total product of Harshaw Co.	$1,155,154.00
Total of Tiptop	1,212,022.60

TOMBSTONE MINES.

T. M. & M. Co.	$2,704,936.00
Contention	2,703,144.39
Grand Central	1,050,875.30
Head Center	191,520.00
Vizina	526,716.00
Corbin Mill	40,000.00
Ingersoll	15,000.00
Sunset	15,000.00
Boston Mill	112,007.83
Total for Tombstone, since discovery of district.	$7,359,200.83

DIVIDENDS.

T. M. & M. Co.	$1,100,000.00
Contention	1,375,000.00
Grand Central	650,000.00
Vizina	80,000.00
Total dividends	$3,155,000.00

The most prominent camp in Arizona is Tombstone, and this has produced the largest supply of bullion. The record of the district from the dropping of the first stamp in June, 1879, to Jan. 1, 1882, is given by the *Epitaph* as follows:

TOMBSTONE M. AND M. CO.

Total to Nov. 1, 1881	$2,482,843.60
For November	112,032.73
For December	130,000.00
Total	$2,704,936.33
Dividends	1,100,000.00

WESTERN (NOW CONTENTION).

Total to Nov. 1	$2,437,144.39
For November	130,000.00
For December	136,000.00
Total	$2,703,144.39
Dividends	1,375,000.00

GRAND CENTRAL.

To Nov. 1	$848,176.46
For November	97,698.84
For December	105,000.00
Total	$1,050,875.30
Dividends	$300,000.00
Repayment original outlay	300,000.00
Total	$600,000.00

VIZINA.

To Nov. 1	$424,693.00
For November	57,023.00
For December	45,000.00
Total	$526,716.98
Dividends	60,000.00

HEAD CENTER.

To Nov. 1st	$156,520.52
For November	20,000.00
For December	15,000.00
Total	$191,520.52

SUNDRIES.

Corbin Mill	$40,000.00
Ingersoll	15,000.00
Sunset	15,000.00
Total	$70,000.00

BOSTON MILL.

To Dec. 1st	$112,007.31

The Boston mill has been reduced all the ore of the Vizina Co.; therefore, the actual production of the mill has been $638,724.29.

RECAPITULATION.

Tombstone M. & M. Co.	$2,704,936.33
Western (Contention)	2,703,144.39
Grand Central	1,050,875.30
Vizina	526,716.98
Head Center	191,520.52
Boston Mill	112,724.29
Corbin Mill	40,000.00
Ingersoll	15,000.00
Sunset	15,000.00
Total	$7,359,917.81

DIVIDENDS.

Tombstone M. & M. Co.	$1,100,000.00
Western (Contention)	1,375,000.00
Grand Central—repayment	300,000.00
Grand Central—dividends	300,000.00
Vizina	60,000.00
Total	$3,135,000.00

To show the yield per ton, etc., and yield of ore from two or three prominent mines, we give the following:

The Contention Con. property from March 8, 1880, to Dec. 31, 1881, produced bullion to the value of $2,678,327, and paid dividends to the amount of $1,475,000, and all resulting from a total ore product of 38,720 tons, which is a trifle over the rate of $59 per ton.

The Grand Central ore output for the eight months and thirteen days of 1881 foots up in total of 22,115 tons, and from its reduction resulted $1,061,875, being at the rate of $48 per ton. Its declared dividends foot up $300,000, besides the $300,000 refunded to those who advanced them for the construction of the mill and hoisting works and the opening of the mine, making thus $600,000 in all paid by this very profitable mining venture.

The Head Center mine, from April 15, 1881, to Dec. 31, 1881, yielded 7,450 tons of ore, from the reduction of which resulted $206,853, being at the rate of $27.66 per ton.

The Virginia Con. Co., up to the 1st instant, produced 5,887 tons of ore and shipped $547,886, in bullion as the result, giving at the rate of $93 per ton.

Pima county contains some of the finest mining properties in the Territory, but we have not space to detail every district. The *Citizen* summarizes as follows:

From the west, begins the great Meyers District, whose ores are rich and plentiful, and where a large city must soon rear its head.

To the south are the districts of Tyndall, full of riches; the Wrightson, equally as rich; Oro Blanco, Arivaca, Greaterville, Helvetia and Empire. In the last-named district the famous Total Wreck mine is located, which promises to startle the world with its output. The Old Hat district to the east is full of great promise, and the ledges there being developed are not a whit behind the best in the Territory. Even in the Tucson range, to the west of the city, the precious metals are found in great abundance, and of no mean character. The time will come when the Santa Cruz will be lined with mills and smelters.

Pioneer district, where the famous Silver King is, demands more than passing notice. Pinal *Drill* says: Pioneer district stands preeminent to-day in our young Territory. We have risen, within the last couple of years, from a perfect *terra incognita* to a shining mark amongst our sister districts. Pioneer district is the first bullion-producing district in the Territory. Universal industry and order prevail. The gambling, wild, reckless excitements of a mining mania do not exist amongst us. With us, mining is a sober, steady business, and no farming community in the country is more free from crime and misdeeds. Solid, substantial development, regular and permanent production and profit, mark the onward progress of Pinal. We can scarcely point to a single undertaking that has failed. Some of them may have had their drawbacks, but they have been overcome. Amongst all stands the king of mines, well named. The industry of this mining enterprise alone scatters amongst its workmen and employees about a thousand dollars daily, and any community that can put a hand into such a pocket, and draw out a thousand dollars every day, for work alone, may be considered wealthy. Still, that is but one item. The Silver Queen, the Mount View, the Wide Awake, the Pinal Con., the Eastland, the North King, the Oxford and Dover, the Lewis, the Goodenough the Specie Paying, the Arizona and Massachusetts, the Hudson and the Hastings Con., are all of them incorporated. Companies, working with Eastern and Western capital, represented here by able superintendents and skilful miners, advancing in the development of their properties with greater or less actual result, according to the progress they have made, and the capital employed in the brief space of their existence. Besides these incorporations, individual owners of mines have, within 1881, expended large sums of money, and done much work. Without singling out any of them, we might name them by the hundred. The contiguous camps of Mineral Hill, Belle Air, Silver King, Queen Creek, Mineral Creek, Happy Camp, Peachville, Rogers, Cole and Randolph districts, all centering at Pinal, are of immense value. All the precious metals abound to a certainty, and we have yet to record a single instance, in which even mere prospects have not shown increased value at greater depth,

As we bsfore statsd, it bsing so lately that we gave a complets review of Arizona's mining prospects, it is hardly worth while, after so short a time has elapsed, to go over the ground again. We do not fail to mention other mines and districts from want of knowledge of their existsnce or merits, but simply for the reason given. It will not do to close this comparatively brief notice of Arizona without referring to the great advantage it hae derived from the Southern Pacific railroad. That road has hronght prosperity to the whole region. It has hrought immigrants, huilt up towne and civilized the region, so to epeak. Its managers seem to have felt a consciousness that Arizona's interests were identical with theirs, and they have taken great pains to disseminate information concerning the regions traversed hy their road.

New Mexico.

New Mexico is creditedhy Wells, Fargo & Co. with a production of $814,944 for the year 1881. The year before it produced $711,300. So an increase is noted, though but a small one. The country is hadly in need of capital to develop its mines, hut now that the railroad has come through, capital is heing attracted in that direction, so it will not he long before mining development will he greatly advanced.

Very little has heen done in the way of devoloping the eection's mineralogical resources, as may he seen from the following tahle, which affords a close estimate of the yield since New Mexico became a portion of the territory of the United States:

1848 to 1808	$2,500,000
1808	250,000
1809	500,000
1870	500,000
1871	500,000
1872	600,000
1873	600 000
1874	300,000
1875	325,000
1875 to 1880	2,200,000
1880	711,300
1881	814,944
Total	$9,601,244

It has heen very difficult to get correct statistics of production of New Mexico. Even as late ae 1880, there is a great difference in the eetimate of production made by Wells, Fargo & Co. and the director of the mint. The latter puts the product for calendar year 1880 at $555,000, of which $425,000 is eilver. Wells, Fargo & Co. fix the figures at $711,300.

The readiness with which capital is taking bold of the mines of New Mexico is very encouraging, and one year more will make wonderful progress in this respect. Long neglected hy capital thers are now many opportunities for its investment, and many ehrewd operators are taking advantage of them.

New Mexico expecte before long to exceed all other regions as a copper-producing country. The New Mexico *Mining World* says:

An investigation of the copper resources of New Mexico lsads to the helief that the depreciation in the value of copper, which will follow in the development of New Mexican mines, will practically exclude the other mines in the United States, if not, indeed, the most of those in the world, from competing with the Territory. One of the richest deposits is at Clifton, 93 miles almost due west from Silver City, and hetween 60 and 65 miles from Coronada. The ore seems almost unlimited in qnantity—in fact there is a solid mountain of copper. To prove this, the first development was hy tunnel at the hase, and from which drifts were carried in all directions, shafts in themeantimeheingsunk from ahove, the ores from the top showing fully as rich as those at the hottom.

The same journal thus eummarizes the eituation at present: The era of prospecting having past, and the day of metal producing hsing already well hsgun, the coming year will he one in which a vast amount of capital will find its proper plaes in the milling and reduction of the vast etores of ore that are opened to inspection in almost every mountain range. In hundreds of districts the rich mineral ie lying on the dumps awaiting a purchaser.

In Silver City, Grant county, there are four stamp mills and two smelters now in operation. At the Lake valley mines a $100,000 plant for reducing the vast qnantities of ores of the Philadelphia companies is to he erscted.

At Socorro the Torrence stamp mill is now in operation. The mine has nearly 700 ft. of levels and 430 ft. of shafts, with mammoth bodies of free milling ore in sight. The La Joya and New Orleans emelter at thie point is completed and has made several successful runs of ore from the adjacsnt districts already.

The Loe Cerillos Rsduction and Milling Co. are huying ores with great diligence in all parts of the Territory, especially in the Magdalenas, where their agent is daily making contracts. In the Cerillos, the Duryea furnace and other reduction works are almost ready to turn out hullion. White Oake has a 10-stamp mill, and the Homestake company have a large plant on the ground, to he erected and working in a few weeks.

The San Pedro and Canyon del Aqua companiee, in the placers, are doing a great deal of work, and will douhtless ship a large amount of hullion in the coming year.

Besides these, there are scores of instances where all the preliminary arrangements have been made to erect mille and reduction works; we speak only of the facts as accomplished. A large interest is shown in a proposition to huild reduction works at Mineral hill, near this city, and we have no douht that the movement will result as its promoters desire. The hullion output of 1882 will not fall anything short of $2,000,000.

The Black range is a section which has attracted great attention. The Black range is eituated in Socorro connty, in the eouthwestern part of the Territory, and constitutes a portion of the main Rocky monntain chain, dividing the drainage of the Cuchilla, Negra and Gila rivers. The more elevated portion is densely timbered with pine and juniper, and pressnts in the distance that somher appearance, which first suggests the name. The most important mines are on the eastern slope of the mountains, or Wild Horse, Turkey, Dry, Mineral and Chloride gulches. The district is 65 milee from San Marcial, on the Atchinson, Topeka and Santa Fe railroad.

Los Cerrillos form a small group of mountains ahout eighteen miles southwest of Santa Fe. That gold existed in these monntains was known to the first Americane who came many years ago to the New Mexican capital. Those Americane who leaped so far into the almost undiscovered country as to settle in Santa Fe, were amassing great fortunes in the mercantile and trading hnsinese, which they established; there was no necessity in their case for proepecting and epecnlation, hence there was no mining done until, with the advent of railroad communication, came thousands of minere and adventurere seeking fortunes in other ways than post-trading. A railroad station was made on the A. T. & S. F. line at the base of the Cerrillos, and a town laid out which hears the name of tbe mountains. The Galisteo creek divides the town site and flows west and south in the basin which lies hetween Los Cerrillos and Placer mountains. The mining camps of Carhonateville, Bonanza City, and Hungry Gulch have sprnng into existence as supply points for thoee engaged in the minee in the immediate vicinity. Horn, ruby, native and wire silver, wire gold, and silver glance have bsen found in several places, while the ores are of the several general kinds of white quartz, iron stained, decomposed; spar and galena carhonate of coppsr and gray coppsr with chlorides and bromides frequently.

In the issue of the MINING AND SCIENTIFIC PRESS of Decsmber 17th, we gave a great deal of space to New Mexican interests, giving an account of the various mining districts, etc. The reader is referred to that issue for much interesting matter in thie connection.

Utah.

Utah Territory makee tbis year a good showing in its hullion product, having turned out $7,311,288 as against $6,450,953, in 1880. The following tahle we take from the Salt Lake *Tribune*, which issued on the let of the month a most magnificent numher, oontaining a mass of information ahout the mines, etc., which must satisfy the most eager inquirer:

WELLS, FARGO & Co.'s STATEMENT OF THE MINERAL PRODUCT OF UTAH FOR 1881.

BASE BULLION.	Lbs. Lead Ref'd.	Lbs. Lead Unref'd.	Ozs. Silver.	Ozs. Gold.
Frisco M. & S. Co.	.....	3,023,213	221,846	425
Germania S. & R. Works.	2,615,373	3,687,284	234,260	191
Hanauer	.....	3,015,228	176,320	438
Horn Silver Mining Co.	.....	16,343,995	1,259,903	.....
Mingo Furnace Co.	.....	11,977,649	437,176	832
Other Smelters	.....	1,634,697	56,680	215
	2,615,373	39,681,966	2,386,185	2,101
Deduct Base Bullion purchased for Germania Refining Works	.....	385,305	18,427	39
Net Product Base Bullion	.....	39,296,601	2,367,758	2,062
Lead, Silver and Gold in Ores Shipped	.....	2,895,026	276,141	560
Total Ref'd Lead, Ores and Base Bullion	2,615,373	42,191,627	2,643,899	2,622

DORE BARS.	OZS. SILVER.	OZS. GOLD
Germania Refining Works	115,219	317
Ontario Silver Mining Co.	1,909,870	.....
Silver Reef Mills	614,368	.....
Tintic M. & M. Co.	73,031	406
Other Mills and Placers	43,804	4,613
Total Dore Bars	2,756,292	5,336

RECAPITULATION.

2,645,373 lbs. Refined Lead, at 5½ per lb.	$ 145,495 51
42,191,625 lbs. Unrefined Lead, at $50 per ton	1,054,790 67
5,400,191 ozs. Silver, at $1.11	5,994,212 01
7,958 ozs. Gold, at $20	159,160 00
Total Export Value	$7,353,658 19

The above includes the oree received from Idaho, Montana and Nevada, aggregating 3,969,440 lbs. lead, 441,846 ozs. of silver, and 976 ozs. of gold. Computing the gold and silver at the Mint valuation, and lead at its value at the eeaboard, it wonld increase the value of the product to $9,401,475.56.

It is impossible in tbe space we have to give even a glance at the various districts, hut must refer the reader to the holiday numher of the *Tribune*. Still a comparison hetween some of the items of the report given ahove, will he of intereet as showing the gains in some of the hullion makers.

The Ontario mine produesd the past year 1,909,870 ozs. silver; in 1880 it produced 1,439,542, an increase of 470,228 ozs., or $521,953.08. A gross production for this mine of $2,119,955.70 during the year 1881 is considerably in excess of the yield of any other single concern. Its yield, moreover, is pure silver.

The great Horn Silver comes next in volume of production. In 1881 it produced 16,343,995 lbs. of lsad, and 1,259,903 ozs. of silver, or a total export value of $408,600 for lead, and $1,398,492.33 for silver, an aggregate production of $1,807,092.33. This is an increase in valuation of $942,290.93 over 1880, or more than 100%. It is proper to state here that in all these reckonings the value of lead is computed at $50 per ton for eaoh year, hut the value of silver was computed at $1.10 in 1880, and $1.11 in 1881.

Ths Gsrmania smelter has made a rsmarkahle increase. Its production of unrefined lead rose from 1,722,865 lbs. in 1880, to 3,687,284 lbs. in 1881; of silver, from 162,909 ozs. to 234,260 ozs., and of Dore hars from 36,422 ozs. to 115,219 ozs. Its production of refined lead fell from 2,892,498 lbs. in 1880, to 2,645,373 lbs. in 1881. Ite production for 1881 represente a value of $145,495.51 of refined lead, $92,200 of unrefined lead, $260,028.60 of eilver, and $127,893.09 of Dore hare—an aggregate production the past year to the volume of $725,617.20, against $364,394.80 in 1880, heing very close to an increase of 100%.

Tbe Mingo smelter made also a snrprieing gain. It produced 11,977,649 lbs. of lead and 437,176 ozs. of silver in 1881, as against 6,464,382 lbs. of lead and 272,832 ozs. of eilver in 1880. The export valne of the product of 1881 is $784,705.36, againet a value of $461,715.20 in 1880. The Mingo smelter is the only one which shows an increased gold product in 1881 over 1880. For 1881 it produced 832 ozs. of gold as againet 675 the year hefore.

The Frisco smelter produced 3,023,213 lbs. of lead in 1881, and 221,846 ozs. of silver, against 2,017,991 lbs. of lead and 125,722 ozs. of eilver in 1880. Valne of product in 1881, $321,799.06; valne in 1880, $190,570.20.

The Hananer smelter (last year Morgan smelter) produced in 1881, 3,015,229 lbs. of lead and 176,320 ozs. of silver, as against 2,733,782 lbs. of lead in 1880, and 157,374 ozs. of silver. Value of the product of 1881, $271,095.20; in 1880, $236,451.40.

The most remarkahle increase in any one item is in that of "lead, silver and gold in ores ehipped," which jumped from 831,600 lbs. lead, 24,024 ozs. silver and 23 ozs. gold to 2,895,026 lbs. lead, 276,141 ozs. silver and 560 ozs. gold.

The Silver Reef mines fell off in prodnction on account of the etrike, which caused a long torpor in the Stormont, and psrhaps from other causes, from 846,062 ozs. silver in 1880, to 614,368 ozs. in 1881.

The Tintic M. & M. Co. made a handsome increase, from 41,923 ozs. silver in 1880 to 73,031 ozs. in 1881.

Montana.

Montana stands credited for the past year with a total yield of $4,359,071, against $3,822,379 in 1880. This increase ie mainly from the large and growing camp of Butte, the hullion output of which, as shown hy the hooks of the Pacific Express Co., for the year 1881, was as follows:

	Weight.	Value.
January	8,441	$ 71,535.82
February	11,253	112,400.35
March	13,036	131,453.01
April	12,835	124,292.24
May	11,738	105,599.47
June	10,409	93,933.93
July	9,573	86,613.41
August	13,556	122,985.17
Septemb r	9,015	78,520.11
October	11,035	94,239.28
November	9,951	82,491.13
December	10,641	94,050.14
	131,787	$1,229,180.06

To this amount, says the *Miner*, must be added $500,000, which was shipped through other sources. The output of the smelters is not given in the ahove table. We have no data upon which to hase ite value, hnt it is reasonahle to suppose that it will hring the grand total up to $3,000,000, as the product of the mines of Butte for the year 1881.

The following is a list of tbe mills, smelters and arastras in Butte and vicinity:

Alice—new mill	60 stamps
Alice—o.d mill	20 "
Moulton	40 "
Silver Bow	30 "
Dexter	15 "
Lexington	10 "
Centennial	10 "
Gagnon	10 "
Burlington	10 "
Clipper	10 "
Grove Gulch	6 "
McMinn's	1 "
Total	221 stamps

SMELTERS.	Capacity.
Montana Copper Co	50 tons
Colorado and Montana	40 "
Parrot	80 "
Bell	50 "
Total daily capacity	220 tons

ARASTRAS.

Suprenant's — Smith & Kessler's

Three million, five hnndred thousand pounds of ore and matte, and 2,000,000 ponnds of bullion were ehipped ont of Montana during the year 1881 hy the Utah & Northern railway.

The following tahle shows the value of gold and silver bullion deposited at the U. S. Assay Office, Helena, Montana, during the year ending Dec. 31st, 1881.

	GOLD.	SILVER.
January	$ 28,093 05	$ 4,364 86
February	23,354 68	3,878 04
March	19,733 12	10,895 11
April	22,844 93	14,348 24
May	41,614 17	4,715 29
June	61,301 02	3,427 00
July	104,792 02	10,685 02
August	63,654 69	6,443 87
September	64,732 69	4,190 47
October	63,828 28	9,310 32
November	59,623 23	13,956 23
December (est.)	17,000 00	13,000 00
Total	$670,636 08	$98,714 04

SUMMARY.

Year ending Dec. 31st	GOLD.	SILVER.
1877	$379,481 18	$241,197 12
1878	298,681 77	404,567 98
1879	512,809 16	175,782 93
1880	495,155 19	97,924 60
1881	670,636 03	98,714 04
Total	$2,260,668 92	$1,018,130 67

There is shown a very great discrepancy in the figures of production from hsre. The *Inter-Mountain* givss the following:

The total amount of silver, copper and gold product in the Butte district in 1880 reached $1,428,088 26. An intelligent idea of the rapid rate at which tbe mining industry of the Butte district has increassd since that time can he ohtained from the following table of production during the year 1881:

Alice Company	$1,120,937 60
Montana Copper Company	1,042,640 00
Colorado Company	864,000 00
Silver Bow Company	600,000 00
Lexington Mill	147,000 00
Dexter Mill	70,208 00
Centennial & Clipper (estimated)	25,000 00
Copper ore shipped	197,000 00
Gold shipped through banks	102,280 20
Total	$4,075,160 70

To this amount should he added the value of 5,000 tons of copper-silver ore extracted during the year and now at the Colorado smelter awaiting reduction. Estimating the value of thie ore at an exceedingly low figure—say $55 per ton—we have $275,000 as its cash valuation. At the Alice mine is an extractod reserve of 4,000 tons, which, at $40 per ton, is worth $160,000. On many other mines of the district many hundreds of tons of high and low grade ore have accumulated, and the moet conservative statistician would not estimate the value of tbe unworkcd ore extracted during the past year at less than $600,000, which added to the above tahulated statement of silver-copper matte and gold production givss as the value of the total output of the Butte district for the year $4,675,150.70. We have purposely omitted the statement of bullion ehipped hy the express company ae, in ordsr to save express rates, which are regulated according to the value of the hullion, shippere almost invarihly misrepresent the value of their consignments.

There are, at least, 300 good minee heing worked at Butte, so the reader can see the impossihility of our even mentioning them.

The Silver creek minos, wbere placer mining is still carried on, have now 146 stamps at work on quartz. The Drum, Lnmmon, Belmont, Cotter and Hickey, Whippowill and Gloster, are the principal ones.

Ten-Mile district is situated on the west side of Red mountain, on the upper portion of Ten-Mile creek, snd in the southwest cornsr of Lewie and Clarke connty. The distriot embraces an area of ahont 16 miles, and is ahout 20 miles nistant from Helena. The main cluster of minee of this camp forms a network along the westem slope of Red mountain.

Red Mountain district, 16 miles south of Butte, will yet prove very productive. The Gregory and Alta-Montana mines of Jefferson district; the Hecla Consolidated mine; the Tront; the Algonqnin of Phillipshurg; the Prospect of Madison connty; the Legal Tender and Last Chance, and dozsns and dozsns of others might he mentioned in an interesting way, did space permit. Suffice it to say that coming railroad facilities will very much broaden the mining possibilitiez of Montana in the near future.

Idaho.

Idaho bullion returns foot up according to Wells, Fargo & Co. $2,834,474, against $1,894,747 in 1880. During 1881 the Wood river country mado rapid advances. The region attracted more attention than other and older regions of the Territory. Up to last year ores were shipped to Salt Lake, and even in 1881 there have been shipped to Salt Lake City from Eastern Idaho, 5,728,741 lbs. of ore during the season of 1881. This contained 3,851,807 lbs. lead, 361,811 ozs. silver, and 645 ozs. gold. The hase hullion prodect of Eastern Idaho, from local smelters, was 796,319 lbs., containing 80,856 ozs. silver and 112 ozs. gold.

Hon. J. J. Lewis, of Ketchum, Idaho, wrote for the very comprehensive and excellent holiday numher of the Butte *Miner* an article giving a history of the Wood river mines, in which he states that it is estimated that 8,000 tone of ore and hullion have been mined and shipped out of the Wood river country this year, representing $1,100,000 in value. Large amounte of ore are left on the dnmps to winter over.

Several silver mills and smelters were taken into Galena, Saw Tooth and Smiley's Basin during the summer, and have been put under conrse of erection. Some of them are nearly completed, and no douht will all be ready in the spring to tnrn out fine and hase hullion in large quantities. A large portion of the ores in Saw Tooth and Smiley districts are milling and of high grade. In tbe districts on Wood river helow Galena City, galena and carhonate ores predominate, the general average of which is ahont 100 ounces per ton silver and 60% lead. The experience of emelting on Wood river provse the fact that there is no difficulty in reducing raw ores of the section with watsr-jacket furnacss. Lime and iron are the principal fluxes needed, of whioh there are plenty to he bad, of the hest qnality. Work ie heing prosecnted this winter on most of the prominent mines throughont this mineral helt. Thousands of tone of ore will he on the dumps hy the opening of the spring market. From the present outlook, very lively times are expected next season.

The Saw Tooth region, the Salmon river conntry, Snake river, Silver City, and many other parts of Idaho, are all producing well, bnt want of space prevente our even summing np results of the various districts, except in figures which show aggregate returns, as we have given above.

Washington, Dakota and Alaska.

Our review has already exceeded the limits set to it, so we must conclude by only brief reference to the above-named Territories.

Washington never did make very much of a showing as a mining region, and this year it shows only $100,963, which is even somewhat less than the year previous.

Alaska mines are mainly confined to the Harrisburg region. Mr. Valentine estimates the yield at $13,000; but a very much larger yield is claimed for it by those interested in the region. The unpropitious climate of the country is a drawback to prospecting, yet a good many miners seem to hunt around there in the summer months.

Dakota sends for 1881, $3,550,000, as against $4,123,081 in 1880, a marked decrease in view of the total sum. This is almost entirely from the Black Hills region.

Dividends and Assessments.

Before giving any figures about dividends and assessments, it is well to state that though they serve as a basis for comparison between one year and another, they are by no means to be considered as reliable indications of the state of the mining industry. There are hundreds of mines in every direction which neither advertise their assessments or their dividends, and the figures from these mines are therefore never made public. In this State particularly there are hundreds of mines which are paying their owners good profits, but which are never heard of by outsiders, and which make no figure at all in the dividend returns as published. Mines which are owned by incorporated companies, or which have stock which is quoted on the boards are those which appear in the list of dividends and assessments. The following tables compiled by the *Exchange*, will, however, give a good idea of this branch of the subject. Of course, the showing is a very imperfect one as showing the whole result, for there are thousands carrying on the business whose operations are not made public. But so far as incorporated companies go we believe the record is very nearly correct. The total assessments levied for the year amount to $7,497,510, of which at least two-thirds have been levied by companies operating on the Comstock lode. On the other hand, the dividends for the year foot up $15,047,068.

Following is a list of the assessments for the year:

Nevada.

STOREY COUNTY.

The Comstock, 54 mines	$5,355,300

ELKO COUNTY.

Argenta	$40,000
Belle Isle	25,000
Blue Belle Con	20,000
Grand Prize	115,000
Howe	10,000
Independent	35,000
Navajo	45,000
Tuscarora	30,000
Total	$320,000

ESMERALDA COUNTY.

Equator	$25,000
Holmes	20,000
Juniata Con	2,000
Lodi	15,000
Metallic	12,500
Mt. Potosi Con	10,000
Real del Monte	75,000
Tilden	10,000
Vanderbilt	10,000
Total	$179,500

EUREKA COUNTY.

Albion Con	$202 500
Phenix	5,000
Total	$207,500

HUMBOLDT COUNTY.

Paradise Valley	$7,000

LANDER COUNTY.

Betty O'Neal	$75,000

LINCOLN COUNTY.

Day	$ 30,000
Hillside	100,000
Meadow Valley	48,000
Total	$178,000

LYON COUNTY.

Silver City	$6,310

NYE COUNTY.

Alexander	$150,000
Belmont	25,000
Gila	25,000
Liguria	25,000
Total	$225,000

WHITE PINE COUNTY.

Martin White	$45,000
Star	40,000
Ward Beecher	20,000
Total	$105,000

California.

MONO COUNTY.

Addenda	$10,000
Bechtel	25,000
Belvidere	30,000
Blackhawk	15,000
Boston Con	50,000
Con. Pacific	55,000
Champion	25,000
Defiance	5,000
Double Standard	25,000
Goodsaw	30,000
Jupiter	10,000
Maybelle	36,000
McClinton	3,000
Mono	175,000
Noondsy	75,000
North Noonday	75,000
Oro	73,400
Red Cloud	20,000
South Bulwer	25,000
Spaulding	10,000
Syndicate	25,000
Total	$808,400

Arizona.

Head Center	$30,000
Northern King	25,000
San Pedro	10,000
Total	$65,000
Grand Total	$7,497,510

The Dividends.

Following is the dividend record for the year, embracing the copper mines of Lake Superior and the mines of Colorado:

Arizona.

Copper Queen	$150,000
Grand Central	250,000
Silver King	300,000
Tiptop	120,000
Tombstone	600,000
Vulcan	40,000
Western	775,000
Total	$2,265,000

California.

Black Bear	$45,000
Bulwer Con	10,000
Gold Stripe	65,500
Great Western, Q. S.	25,000
Green Mountain	100,000
Idaho	263,500
Inyo Con	35,000
Magalia	15,000
Napa Con., Q. S.	90,000
New York Hill	100,000
Plumas Eureka	135,469
Plumas W. & M. Co	7,500
Quicksilver Mining Co	525,391
Rising Sun	25,875
Sierra Buttes	76,250
South Yuba	82,500
Spring Valley	50,000
Standard	675,000
Yuba	8,000
Total	$2,630,085

Colorado.

Bonanza Develop Co	$135,000
Catalpa	180,000
Chrysolite	500,000
Dunkin	110,000
Evening Star	425,000
Gem	2,750
Glass-Pendery	25,000
Hibernia	150,000
Iron Silver	400,000
Leadville Con	20,000
La Plata	180 000
Morning Star	50,000
Moore M. S. Co	30,000
Polonia	12,000
Robert E. Lee	50,000
Robinson	450,000
Silver King	50,000
Total	$2,770,750

Dakota.

Deadwood-Terra	$900,000
Father De Smet	130,000
Homestake	360,000
Total	$1,300,000

Georgia.

Con. Gold	$28,000
Total	$28,000

Mexico.

Jocuistita	$200,000
Total	$200,000

Michigan.

Calumet & Hecla	$2,000,000
Central Copper	120,000
Lake Superior	100,000
Osceola	225,000
Quincy	320,000
Total	$2,765,000

Missouri.

St. Joseph Lead	$60,000
Total	$60,000

Montana.

Alice	$400,000
Boston & Montana	100,000
Gagnon	5,000
Hecla Con	75,000
Total	$640,000

Nevada.

Brown & Urton	$8,333
Eureka Con	255,000
Exchange S. M. Co	25,000
Indian Queen	63,750
Navajo	25,000
Northern Belle	400,000
North Belle Isle	15,000
Richmond	810,000
Starr-Grove	120,000
Total	$1,082,083

Utah.

Christy	$30,000
Horn Silver	300,000
Ontario	850,000
Stormont	20,000
Total	$1,194,000
Grand Total	$15,662,068

Mining Accidents.

Although not perhaps strictly belonging in a mining review, we give the following list, compiled by the *Chronicle*, of the mining accidents which occurred during the past year.

January.

6. Sierra Nevada mine—August Swenson, carman, was killed on the 2300 level by something falling on him from above.

24. Liberty Hill, Cal.—R. Avery killed by falling of derrick.

25. Virginia City, Union shaft—W. H. Abbott, pumpman, struck by buckboard, fell 50 ft.; torn by hob; died.

February.

3. Union mine, Nevada—McQuarry fell 100 ft.; he broke no bones.

14. Placerville, Lyon gravel mine—Philip Walford run over by a car and fatally injured.

23. Quaker Hill, Cal., at Sargent & Jacob's drift mine—H. F. Bulleman's arm was cut off by machinery.

24. Zeile mine, Amador county—John Retallic killed by a blast of Giant powder.

March.

10. Derbec mine, North Bloomfield, Nevada county, Cal.—William Harrie killed by being thrown out of a car 300 ft. down the shaft.

11. Virginia, Nev., Union shaft—M. McLanmon killed and J. C. Cavanaugh dangerously injured by fall of section of pump column.

18. Tombstone, Goodenough mine—Robert Lynch killed by falling into a shaft.

26. Scott's Flat, hydraulic claim—Two Chinese miners killed by a cave.

April.

2. Brandy City, Cal.—Alexander Arnott killed by blast in gravel mine.

8. Tombstone, Empire mine—William Connors was killed by falling 300 ft. down a shaft.

9. Nevada City—John Pascos killed by a cave while prospecting.

20. Bodie—Frank Allen by explosion of Giant powder caps near is cabin; lost both his hands, and was otherwise severely lacerated.

22. Eureka, Nev., Richmond mine—Ed. J. Bennett killed by a cave.

May.

18. Virginia City, in the Forman shaft—James Perry's skull was crushed by a falling rock; he died on 23d.

19. Silver Reef, W. T., Christy mill—H. Thomas, amalgamator; caught in belt; died next day.

25. Auburn, Or.—Three Chinamen tunneling killed by cave.

June.

1. Ward, Nev., in the Martin White tunnel—A miner rendered unconscious by fumes of powder narrowly escaped death by explosion.

4. Eureka, Nev.—Mike Mulligan was killed by falling down a shaft.

5. Virginia City, in the Andes mine—Maloney, Hunter and Sanders were suffocated by gas.

8. Man killed by falling 400 ft. down shaft.

9. Bodie, in Bechtel mine—Norman McSwain killed by explosion.

13. Oscsola, Nev.—C. Penalula, foreman of the Crescent & Eagle mine, fell down shaft 40 ft. and was killed.

24. New York Hill mine—William Keyes much injured by explosion of blast.

27. Grass Valley, Sebastopol mine—Fire; loss $12,000.

July.

18. Bodie, Bechtel mine—Alex. Larsen was killed by a fall from the 200 to 400 level.

25. Forest City, Sierra county, Bald Mountain mine—David Curnow was crushed by a car of dirt against the timbers of the tunnel, and died five hours afterwards.

26. Idaho mine, Grass Valley—Richard Wedlock was killed by a cave.

August.

3. Near Baker City, Or.—At hydraulic mine, Porter was killed by the caving of a bank.

18. Nevada City mine—McNally seriously injured when endeavoring to jump on a moving car.

Nevada City, Murchie's mine—Philip Dunn badly hurt from fall caused by a broken chain.

28. Mineral Creek, A. T.—Charles Horn fell in a shaft 15 feet, breaking ribs.

September.

24. Idaho Mine, Grass Valley—John Eustis' foot was so crushed by machinery that amputation became necessary.

26. Moore's Flat, Nevada county—Works of Blue Bank hydraulic mine covered up by landslide; damage, $200,000.

October.

6. Grand Central mine, A. T.—James Sully, carpenter, was killed by falling down the shaft.

7. Sulphur Bank quicksilver mine, Lake county—Twelve men were suffocated by a cave in the air shaft.

8. Eureka, Nev., Boston mine—Patrick Haggerty and Quinlan Harrington fell down shaft 110 feet, but were not killed.

9. Savage mine, Virginia City, Nev.—Andrew Neenan was killed by being thrown from the giraffe down the chute.

Sierra Nevada mine, Virginia City—Jeremiah Harrington died from being overheated.

November.

11. Mokelumne Hill, Coral Flat mine—Engineer John Laswell's clothing was caught by cogs, his body thus passing between the wheels and he was killed.

27. Eureka, Nev., Consolidated mine—John O'Keefe, water carrier, fell down shaft 500 feet and was instantly killed.

29. Relief Hill, Nevada county—William Corbett was caved on and then washed through a flume; dead.

December.

3. Virginia City—T. Matthews fatally scalded by hot water.

Virginia City, Forman shaft—Thomas and Rowe killed by explosion of Giant powder cartridge.

10. Moore's Flat, Nevada county—The ridge slid down on Blue Banke hydraulic mine, burying the works.

21. Mount Zion, Nevada county, drift mine—L. Pendleton crushed to death by timbers giving away.

Conclusion.

We have confined ourselves mainly to precious metal mining in this article, especially when speaking of California. To more than refer to quicksilver, copper, coal, iron, etc., would far exceed the limits which our space admits.

After a successful run of the Modoc Co.'s furnaces at Lookout, Inyo county, Frank Fitzgerald, the lessee, has shipped 28 tons of rich bullion. Average value of bullion per ton in silver, $680.50; gold $23.60; total, $709. Total value of shipments, $21,000.

Subscribe for the Mining and Scientific Press, and get all the current reliable news from the various mining camps on the coast. The price is only $4 a year, post paid.

Copper.

The price of copper has recently advanced, much to the gratification of people owning copper mining properties. And already it is exercising an appreciable effect on this branch of mining, as copper properties are more sought for and command more attention than they have for a long time past. The market here may be quoted as follows: Sheet, 20c; cement, 100 fine, 15½@—c; bar copper, 22c. We quote manufactured copper, per lb.: Braziers' ordinary sizes, 16 oz. per square foot and over, 33c; locomotive fire-box sheets, 33c; Braziers' ordinary sizes, under 16 oz., and over 12 oz. per square foot, 35c; all sheets 10 and 12 oz. per square foot, 37c; all sheets under 10 oz. per square foot, 39c; circles less than 34 inches diameter, 36c; do. 34 inches diameter and over, 39c; segment and irregular pattern sheets, 36c; sheathing (sheets 14x18) 14 to 34 oz., 31c; bolt copper, 33c; ingot copper, 22c.

Jas. Lewis & Sons, of Liverpool, report that during the first part of December, copper gradually advanced £3 per ton and during the latter part, £1 per ton. This advance has been caused by the increasing scarcity of copper, the disinclination of holders to part with it, and the steadily improving statistical position of the metal; although as is customary at the end of the year and in consequence of the holidays, the deliveries and sales have been on a reduced scale. On Dec. 6th, the smelters advanced the prices of English copper £3 per ton, and again on the 16th to £85 for India sheets, and £86 per ton for other sheets. Tough cakes on the 1st inst. was quoted at £71 to £76, and select ingot £76 to £78 per ton.

The arrivals from Chile have been 2,418 and the deliveries 3,265 tons; and from other countries 2,235 and 2,391 tons respectively.

The sales of furnace material for December include 1,465 tons of precipitate, ranging from 13 shillings to 14 shillings, 6 pence per unit.

Quotations on the 1st inst. were, good ordinary brands £70, 17s. 6d. to £71, 5s., and with three months prompt £71, 10s. to £72 per ton. Ore 14s. 0d; regulus 14s. 6d. to 14s. 9d. per unit.

Chile exports for the year amount to 39,037 tons fine. Stocks of West Coast produce are equal to 25,836 tons fine, against 26,683 tons on Dec. 1st.

Lodes in Placer Claims.

There has been more or less discussion on the subject of the discovery of lode claims within the boundaries of placer claims, as to the rights of the owners under certain circumstances. The Commissioner of the General Land Office sets the matter at rest in one way, at least, so far as a department of the Government (aside from the courts) can do such a thing, by deciding that lodes discovered within the limits of placer claims, after application for patent for the placer claim was filed, are no bar to the issuance of a patent as applied for.

A man named Becker claimed to be the owner of a lode claim, located many years before, which a man named Sears had fraudulently included in a placer survey. Becker protested against a patent being granted to Sears. The land office directed that testimony should be taken upon the two following points, to wit: First, whether a lode actually existed as alleged; and second, whether such lode conformed to the diagram required to be submitted. Protestant having complied with the requirements stated, the hearing was held.

After the date of hearing, Sears filed a relinquishment of the area embraced in the Soda lode survey. Other people also filed affidavits since, alleging that there are a number of lode claims other than the Soda lode, and that these affiants were working them.

The commissioner says: "These affiants allege nothing which will warrant this office in further suspending proceedings for patent. The fact, if admitted, that lodes are now known to exist within the placer claim, constitutes no bar to the issuance of patent, provided they were not known at the date of application for patent. The applicant, at the date of application, alleged under oath, that no such lodes were known to exist, which allegation was supported by corroborative affidavits. I think the testimony taken at the hearing clearly shows, that while there is a natural fissure filled with miscellaneous material which was located at the Soda lode, there never has been a pound of mineral-bearing ore taken therefrom, although it would seem that at different times various persons have thoroughly prospected the same by shafts, tunnels and other excavations. Therefore, the fact that the applicant has relinquished the area claimed as the Soda lode, does not, in my opinion, affect the *bona fides* of the persons who made oath to the effect that no known lodes existed at the date of application for patent."

A rich strike was made at Gray's Flat, El Dorado county, the other day, resulting in a clean-up of over $11,000 in gold. The point where this strike was made on Monday is but a short distance from where the Grays cleaned up about $100,000 from a chimney a few years ago, and this one gives promise of being equally as prolific.

TONITE.

POWER WITH SAFETY.

Used in Europe for six years; on this Coast since January, 1881. No accident has ever occurred in storing, transporting or handling it. Is shipped all over the world, and is the favorite explosive, especially in extremely hot and cold climates.

Does not contain any Nitro-Glycerine, Chlorate of Potash, Sulphur, nor any other substance which explodes by friction.

The Only Really Safe High Explosive.

TONITE always retains its strength, there being no liquid substance in it to leak out. It is always uniform and reliable. No climatic change has any effect on the quality of TONITE. In hot or cold atmospheres of any extreme, it undergoes no alteration. The price paid for TONITE is for the power inherent in it and always remaining in it, while Nitro-Glycerine mixtures constantly vary in strength, and age destroys their explosive quality altogether.

We are Prepared to **SELL LOW** and give Best Value.

We Manufacture, also, Detonators, Electric Exploders, Etna Caps, Torpedoes, Distress, Fog and Alarm Ship Signals.

MINERS' HORSE-WHIM.

One Horse can easily heist over 1,000 pounds at a depth of 500 feet. The whim is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The standard of the whim is bolted to bed-timbers, thus avoiding all frame work. When required these whims are made in sections to pack on mules.

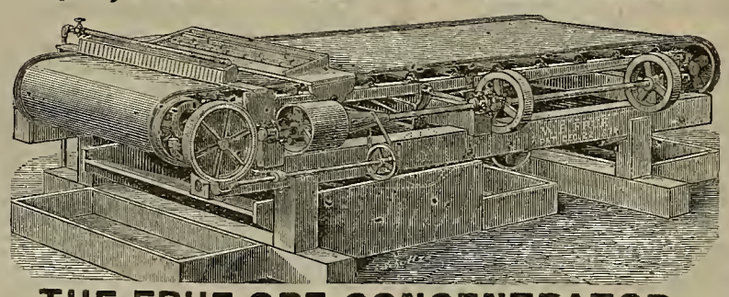
$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR.

Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.

Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.

We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.

☞ A machine with all improvements can be seen in working order and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont street.

ADAMS & CARTER, Agents, Room 7 No. 109 California Street, S. F.

A NEW RAILROAD.

Carson and Colorado Railroad, **Nevada.**

NOW IN OPERATION TO HAWTHORNE

110 MILES SOUTH OF CARSON, NEV.

The direct, shortest and cheapest route for freight and passengers to the following mining towns and camps: Aurora, Bodie, Bridgeport, Belleville, Candelaria, Columbus, Benton, Montezuma, Silver Peak, Alida Valley, Bishop Creek and Gold Mountain.

C. and C. R. R. trains make close connection at Mound House Station with trains of Virginia and Truckee Railroad, making close connection at Reno with East and West bound trains of the C. P. R. R.

Passengers leaving San Francisco and Sacramento on C. P. Overland train arrive at Hawthorne and connect with U. S. Stage Company's line of Concord coaches at 2:45 P. M. of the following day, arriving at Bodie same evening.

Wells, Fargo & Co.'s line of Fast Freight Wagons leave Hawthorne daily, delivering fast freight in Bodie within 36 hours from San Francisco.

To insure dispatch by team transportation from Hawthorne, shippers are requested to mark freight Care D. W. Earle & Co., Forwarders, Hawthorne, Nev.

The Sackett School, Oakland, Alameda County, California.

THE Sackett Boarding School has in a brief time gained a leading position among the many private schools of Oakland, which fact affords the best possible proof of superior merit. The Principal, Mr. D. P. Sackett, has been long and favorably known there as a teacher and disciplinarian. The location of the school is convenient, healthful and attractive. The comfort and well-being of the students is an especial feature of the domestic department, and the moral and physical training of the pupil is carefully conducted.

In their mental training great prominence is given to the fundamental branches which must enter solidly into all genuine education. This institution is the youngest of the many private schools across the bay, and has shown rare vigor and enterprise in many ways, and more particularly in providing the most competent teachers. D. P. Sackett, A. M., of Yale College, is the Principal; George W. Drew, A. M., of Yale College, is head master; Allen E. Janvier, A. B., of Yale College, is in charge of the English Department; Mary K. Culbertson, State Normal School of New York has charge of the department of Natural Science; Mrs. George W. Drew has the department of Music, and Alanson H. Mayers, A. M., of Harvard College, English Studies.

Twice has the building (shown in the engraving) been enlarged and beautified until now it stands out as one of the finest educational ornaments of the Athens of the Pacific. The grounds are as home-like and cheerful as those of any private residence, and one feels at once that the young men who have a school home there are comfortably situated. Young men from the interior would do well to send for catalogues, as special advantages are provided for them in the courses of instruction.

"THE $1,000 CHALLENGE"

Ore Feeder for Quartz Mills.

OVER 800 ARE NOW IN USE, GIVING ENTIRE SATISFACTION.

Awarded First Premium at the Tenth and Twelfth Industrial Fairs of the Mechanics' Institute.

Twenty Per Cent. More Ore Crushed with Fifteen Per Cent. Less Wear of Iron than by Hand Feeding.

The accompanying cut illustrates the recently introduced Grip, and also the Spring Attachment, which replaces the Weight heretofore used, and which are obvious improvements.

It is now fully demonstrated, after careful and long continued experimentation and practical use, that the plan upon which a perfect Ore Feeder must he constructed is that of a carrier, and not that of a shaking-table. Uniform and accurate feeding is not possible upon the latter plan. The ore must he evenly carried, upon a steadily advancing plane or table, to the line of discharge, and there simply dropped. Jerky or spasmodic contrivances will not answer the purpose for wet or sticky ores.

The Challenge Ore Feeders are now in Use in the following Mills, besides many others

Superiority of the "Challenge" Ore Feeder Demonstrated!

At the "Christy" Mill, Uintah County, Utah, the "Eclipse" Feeders, (conceived by E. Coleman) were introduced, but not carrying a regular supply of ore for the crushing capacity of the stamps, were replaced by the "Challenge," which are now running and the stamps crushing forty (40) per cent. more ore than was done by the "Eclipse."

The "Harshaw" or "Hermosa" Mill, of Patagonia District, Arizona, was also originally fitted with "Eclipse" Feeders, but after a few weeks trial they were pronounced inadequate to the work, discarded, and the "Challenge" adopted.

The "Silver King," Mill of Arizona, also removed the "Eclipse" Feeders to give place to the "Challenge."

The "Sola" Mill, of Brown's Valley, Yuba County, Cal, was fitted with "Victor" Feeders, manufactured by E. T. Steen, but proving insufficient, the "Challenge" Feeders were substituted.

Four of the "Victor" Feeders, manufactured by E. T. Steen, were also placed in the "Alexander" Mill, at Grantsville, Nevada, but after a fair trial were discarded, and Hendy's Feeders fitted, and four others of the same pattern added when the second twenty stamps were erected.

These cases are simply cited from among many similar instances, in proof of the vast superiority of the "Challenge" Feeders over all others.

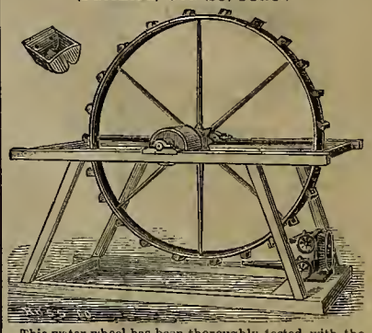
THE PELTON

WATER WHEEL.

(Patented, Oct. 26, 1880.)



This water wheel has been thoroughly tested with the Dynamometer, and utilizes 78% of the theoretical power; and underheade of water of 75 to 800 ft ie guaranteed to give better satisfaction than any Turbine or other wheel ever offered to the public. The above per cent, is due to the peculiar shape of the buckets used. They do not reduce the water to a spray, but divide and deflect it outward and hackward, in such a manner that a part of the impact and the whole reactionsry force are utilized, without any part of the water coming in contact with the bucket following. Furthermore, the per cent. of efficiency remains constant through great variations in the amount of water used. These buckets can be taken off in transportation, and can he replaced by new ones when worn out by sand in the water; also can be applied to wooden wheels when desired.

Mining and Scientific Press.

THE MINING AND SCIENTIFIC PRESS is the leading mining journal in America, and enjoys a larger circulation among the more intelligent operators and workers in the gold fields of the world.

Established in 1860, it has firmly maintained its position as a reliable, progressive journal. The information given in its columns has saved millions of dollars to the practical miners, metallurgists, mill men, mine and shareholders on the Western side of our continent.

Among its contributors are the ablest and most experienced mining engineers, superintendents and practical miners in this country.

The PRESS gives a condensed summary of Mining News from the most important mining districts of the country.

New processes and methods of mining are described in its weekly issues. New mining machinery and improvements are frequently illustrated and explained in a manner to be of great value to all interested in mining.

As a scientific and mechanical representative of the Pacific coast it is decidedly popular, and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivalled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer, will find profit by its reading.

Subscription, $4 a year in advance. Sample copies, postpaid, 10 cents.

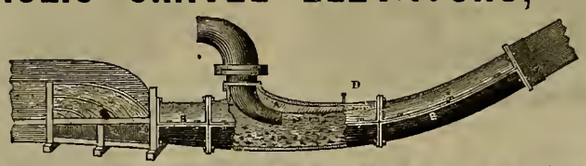
Good Land and Sure Crops.

There has been steady and tolerably rapid advancement made in the growth of a majority of the towns in Colusa, Butte, Tehama and Shasta counties. Especially is this so in the agricultural districts where the land produces at least fair crops in all seasons—wet or dry—as does the land on the Reading Ranch. Those looking for homes in California where diversified farming will pay every year; where wood and water are plenty and easy to be obtained, and other desirable advantages are to be had, should address the proprietor of the Reading Grant.

Some 14,000 out of 26,000 acres of the grant remain for sale at comparatively low rates, in quantities to suit purchasers, on easy terms. Prices range from $5 to $30 per acre. The tract is between two and three miles wide, with the Northern Division of the C. P. R. R. passing centrally through its entire length. Send postage stamp for free circulars containing information about Shasta County and these lands, to the proprietor of Reading Ranch. EDWARD FRISBIE,

Anderson, Shasta County, Cal.

HYDRAULIC GRAVEL ELEVATORS,



For working flat gravel mines that have no dump.

Sluices gravel and water up hill on an angle of 45°, and will run any kind of gravel that will run in a flume. Handles rocks as easy as fine dirt, and will raise as much material as the water will carry off in a flume on 6 inches grade to 12 feet.

No bedrock cuts, tunnels or drains required. Machine a sufficient drain itself, and the process of mining the same as any other hydraulic mine. Is now a practical success in various places in California and Oregon. Send for descriptive circular to

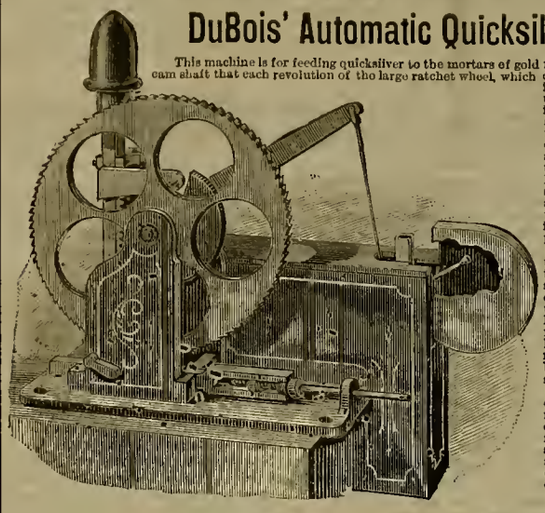
THE STRONGEST BARROW MADE. These Barrows are made by Superior Workmen, and of the best material. All sizes kept constantly on hand
SHEET IRON PIPE.
Lap-Welded Pipe, all Sizes, from Three to Six Inches. Artesian Well Pipe. Also, Galvanized Iron Boilers, from 25 to 100 Gallons.
Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools supplied for making Pipes. Estimates given when required. Are prepared for coating all sizes of Pipes with a composition of Coal Tar and Asphaltum.
Office and Manufactory, 130 Beale Street, San Francisco.

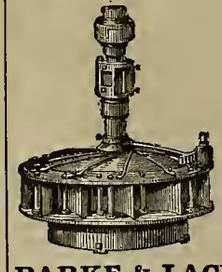
SHEET IRON PIPE.

DuBois' Automatic Quicksilver Feeder.


This machine is for feeding quicksilver to the mortars of gold mills. It is so connected to the cam shaft that each revolution of the large ratchet wheel, which can be regulated to revolve once in one, two, three or four minutes, as desired, dips a small cup into a reservoir of quicksilver, and by a trip of the cam, empties the contents into a pipe leading down to the mortar, supplying an exact quantity at regular intervals, superseding the ordinary hand feeding, which is of necessity subject to great irregularity, and liable to neglect. It renders the amalgamation of all the gold in the pulp equally certain and perfect.
The mechanism to produce this depression and elevation of the cup, is driven by the cam shaft, similarly to the self-feeders, over which so much ingenuity has been expended to regulate the delivery of ore to the mortar. As it is to be desired to have the ore go in constantly and regularly, so it is equally desirable to have the mercury fed constantly and regularly.
A chief point of excellence of this machine is, that it allows the quantity of mercury which would be otherwise fed in mass, in one hour, to be subdivided into a number of small portions, and fed almost continuously; *i. e.*, from every one to four minutes.
Price, complete, $100.
For Sale by **WHITNEY & MARSHALL,** Sole Agents
22 & 24 Fremont St., San Francisco.
Dealers in Iron, Steel, Hardware and Mining Supplies, Wrought Iron Pipe and Fittings, Pump Columns, Wire Rope, etc. A large stock of Boiler, Plate and Sheet Iron of every description.

MOREY & SPERRY,
MANUFACTURERS OF
Gold and Silver Grinding and Amalgamating Machinery

HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.
IT HAS BEEN FULLY PROVED AND TESTED.
It weighs complete, 7,000 pounds. It costs $1,500 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill. It requires twelve-horse power.
Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver ores, Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill supplies. Iron Work complete for Wood Frames, also
SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.
☞Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.
MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

LEFFEL'S IMPROVED WATER WHEEL.


PRICES REDUCED!
PATENTS REISSUED 1868.
The "OLD RELIABLE" with improvements, making it
THE MOST PERFECT TURBINE NOW IN USE.
Comprising the **Largest** and the **Smallest** Wheels, under both the **Highest** and **Lowest** head used in this country. Our new Illustrated Book sent free to those owning water power.
Those improving water power should not fail to write us for **New Prices**, before buying elsewhere. New Shops and New Machinery are provided for making this Wheel. Address

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, No. 252 Market St., S. F.

FOR THE WEEK ENDING JAN 10, 1882.

252,084.—DIRECT-ACTING ENGINE—Geo. E. Dow, S. F.
252,216.—ELASTIC COMPOUND FOR TRUSS PADS—H. W. Hendricks, Portland, Oregn.
252 108.—TRACK COUPLING—Geo. W. Hunter, Merced.
252,116.—WINDMILL—T. E. Martin, San Jose, Cal.
252,234.—HARROW—Thos. Mathieson, Almaden, Cal.
252,250.—BLASTING POWDER—W. R. Quinan. S. F.
252,143.—DEVICE FOR HANDLING COOKING PANS—J. W. Ross, Santa Clara, Cal.
252,145.—MAGAZINE FIRE-ARM—A. Schneider, S. F.

FOR THE WEEK ENDING JANUARY 17, 1882.

252,414—BOX COVER PRESSES, E. Austin, Winters, Cal.
252,318—COMBINED POTABLE PANTRY, DRESSER AND SIDEBOARD, L. G. Hudson, Stockton, Cal.
252,385—RUBBER STAMP CABINET, C. A. Klinkner, S. F.
252,333—CROSSCUT SAWING MACHINE, W. H. Smith, Portland, Or.
252,408—SIDE-BOARD, Geo. B. Wilbur, S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Cotton Hose.

Cotton hose is now made for fire and garden use, which can be put away for years and its strength not be impaired by mildew or rot. For miner's use all know how effective cotton hose is. It is made rubber lined and prepared mildew proof. Thie hose, which is advertised in another column, is in nee in fire departments of Enreka, Santa Clara, Alameda, San Rafael, Sacramento and Santa Cruz, in this State, and in Carson, Nevada. What is thought of the hose hy those who have used it, is best shown by one of the late lettere abont it, which is as follows:

Copy.

SANTA CLARA, CAL., Jan. 16, 1882.

C. A. Edson, Esq., Chairman F. and W. Committee, Alameda Cal.—DEAR SIR: In reply to your inquiry as to what the firemen of this town think of the cotton hoee in use here, I will eay they like it very much. They have not had it in uee long enough to test ite dnrability, hut npon that ecore, the Fire and Water Co. made full investigation, and were eatisfied. We had occasion to purchase 1,000 ft. of fire hoee lately. We hought 500 ft. Malteee Cross rubher hose and 500 ft. Paragon cotton hoee. It is my opinion, as well ae the opinion of othere interested in fire department matters, that it would have heen for the hest intereste of the town to have purchased Paragon cotton hose entirely. Our reasons are: First, we helieve it to he ae dnrable as the rubher hose, if not more so; second, it ie lighter to handle, and third, it occupies lese space on the reel. Yours, etc.,

JNO. A. NACE, of F. and W. Com.

I fully concnr in Mr. Nace'a opinion in regard to the cotton hose.

R. MENZEL, Foreman Hoae Brigade.

News in Brief.

BETWEEN $700 and $800 worth of wire gold has heen taken from the Ontario mine, at Butte, M. T.

THE Canadian Prese Association is urging the government to take ateps to aholish postage on newepapers.

SEATTLE had a $1,500 hlaze ou Monday evening, heginning in a Chinese wash-house on the west aide of Washington atreet.

THE sentence of Alvino Pico, convicted of larceny at San Jose, has been deferred to give time for inquiring as to his sanity.

TWO HUNDRED destitute Russian Jews reached Hamhurg on Wednesday. They are endeavoring to ohtain aid to proceed to America.

THE delinquent tax list of Nevada county amounta to $20,000, inclnding over $12,000 due from the Central Pacific railroad company.

IT is aaid that $1,500 has been offered for a seat in the San Francisco Produce Exchange, which ie $500 more than the price fixed hy the Directore.

NYE Co., Nev., is the largest county in the United States, covering 24,000 sqnare miles; San Bernardino, Cal., with 23,000 square miles is the next largest.

THE Virginia *Enterprise* contains the following interesting itema ahont the hydraulic pump:

The hydraulic pump at the Chollar-Norcroee Savage shaft is running well and emoothly under the natnral flow and pressure of water bronght from the big reservoir on the side of Mt. Davidson. The water comes to the top of the shaft under a pressure of 440 ft. vertical, and the pump heing 2,400 ft. helow the surface, a preesure of 2,840 ft. is tins exerted upon it. The pump started off at 3⅜ strokee per minnte, hnt thia will eoon he increased to 4 strokes, if it hae not already been done. As the feed pipe from the reservoir is 12 inches in diameter, we may expeot to eee a great increase in the flow of water noted in the next report of the Sutro Tnnnel company; also, some marked changes in the temperature of the air and water at different points along the tunnel.

Horton's Wooden Pipe.

Some three and a half years since, a patent was ieeued to W. N. Horton, for an improvement in wooden water pipes, the principle of whioh ie to nnite the meeting ends of the lengths hy an iron hand, so that after the water is let in, the expansion of the wood will eoon make a tight joint; and as the water hes access to the ends of the pipe within the joint, it will permeate the entire eection through the poree of the wood, drawing the sap out, and keeping the wood in a water-eoaked condition, which is acknowledged hy all engineeretopreserve it and render it nearly indestructible. This pipe should not he mistaken for the ordinary common wooden pipe, which is made with a counter-hore at one end of each eection, the oppoeite end heing made small enough to enter the counter-hore of the next section, and thne unite the eections into lengths. This style of pipe is open to two serious objections. Firet, that when so united, the outer shell of the counter-hore is not exposed to the action of the water within the pipe, and will, in conseqnence, he apt to dry-rot and destroy the joint, and aleo the usefulness of the pipe. The eecond objection lies in the greater size which it is neceesary to make the pipe for a given diameter of bore, to provide for the counter-hored and reduced ende, to give these the requisite strength.

The succese which this pipe has met since the commencement of its nse, more than jnstifies the favorable opinions expreesed at that time. The patentee has a contract for some 20 milee of thie pipe, to he laid in connection with the water works at Ogden. Some 10 or 11 miles of eix and eight-inch pipe are already laid and in use, carrying water under a pressure of 90 lbs. to the inch. At a trial in Decemher last, water was throwu from an inch nozzle, by direct pressnre from the pipee, to a hight of 80 ft.

These worke give good satisfaction. Water passing through wood pipes receives no bad taste from the corrosion of the pipes or other causes.

This pipe coets, when laid, ahont two-thirds lees than cast iron pipe, and when the item of traneportation ie coneidered, the difference in weight ie very greatly in favor of the wood pipe. For particulars ae to cost, etc., address T. H. Horton, P. O. Box 2,328, San Francisco, Cal.

[Advertisement.]

More About Water Supply.

The demand on us for information hae recently become so great that we are unahle to reply to the letters daily received, and we havo thus found it necessary to puhlish this additional circular, and to provide the meane for meeting the demands of those who desire wells for domeetio, etock and other parposes. Ae a large demand for the *points* used in the constrnction of the driven wells has recently arisen here, it hae occurred to us that many of them are heing put down without authority or license. *The purchase of the point does not give the legal right to put down and use a well.* The driven well is the invention of Col. Nelson W. Green, of New York, and is secnred to him by lettere patent No. 73,425, No. 4,372 (re-issued) and No. 218,875. Theee patente have heen exhaustively litigated in the U. S. Circuit Courte, in the Statea of New York, New Jersey, Massachueetts, Iowa and Minnesota, and in every instance decided in favor of Col. Green. Because of the immense value and utility of these inventions, combinations of large means and influence have been made at different timee to defeat the collection of royalties and licenses. In one of these cases reported in 13th Blatchford, page 208, 19 days were occupied hy the most ahle counsel in the argument, and over 3,000 printed pages of evidence and briefa were before the Court on hehalf of the plaintiffs alone, and the expenses of the auit were over $100,000. The opinion was prepared hy Judge Benedict, and completely established Col. Green's claim at every point. Judgee Dillon, Nelson and Blatchford have all rendered opiniona to the same effect; and in a hundred other cases, arising out of collateral mattere, have the title and right of Col. Green been most fully sustained. Our object in making these statements is to

Caution

All persons against the nse of the driven well without authority, and to say that no person or persons have the legal right to put down or use a driven well in California without authority or license from us. We are the exclusive agents and attorneys of Col. Green, for the States and Territories west of the Rocky mountains, and intend to enforce and protect hie righte, ae well as our own, to the uses and heneits of these patents. Should any peraon offer to put down a driven well for you, request him to exhibit his authority from us, and if he is not ahle to do thie, you may rest aesured that you will be required, sooner or later, to pay license to us.

To answer the conatantly increasing demand for information, to guard against

Fraud and Imposition,

And to supply the orders as fast as they may arrive, we have made arrangements with the well-known house of

Huntington, Hopkins & Co.

To keep on hand all materials necessary for the construction of these wells, whioh will he shipped hy them on receipt of the price etated. Upon the receipt of such order hy them, or ns as etated helow, a full and minute letter of instructions as to the manner of constructing these wells will also be eent, so that anyone of ordinary sense can put them down ae perfectly as those especially engaged in the husiness. Thie letter of instructions—*together with the license*—will be eent with the goode. The articles eent will include everything necessary to a complete and perfect well, and also a pump of suffi cient capacity to deliver 900 gallons of water per hour. Without thie letter of instructions, and careful attention to the directions it containe, it ie more than likely that the attempt to put down a eatisfactory well would fail, and thus the goods furnished would prove a partial loes. In adopting theee means of putting the driven well within the reach of everyone, the expenses of employing an expert, eo called, are avoided, and the coet of the well is therehy eo reduced as to he within the reach of everyone. One of these welle cau he easily conetructed hy two men in two days—usually in one day—to a depth of 50 ft.

Where eeveral wells are required in the eame neighhorhood, the work can be greatly facilitated hy purchasing a few additional tools, costing not over $20. These mey he returned to us, if not broken, and one-half of the purchaee price will be refunded.

When desired, we will send an expert, for coet of transportation and $5 per day. Contracts for large water enpplies will he entered into hy us upon the most favorahle terms—*upon the basis of success or no pay.*

Material for welle not more than 40 ft. in depth, including pump and licenee, will he sent for $45. Wells of 50 ft. will be supplied for $50, and for eech foot over 50 ft., at 40 cts. per foot—to he sent, *in all cases*, hefore the goode are ehipped.

In eending your order, it will he of advantage also to send us as full and accurate a description of the proposed location of the well, the distance—or snpposed distance—of the water beneath the surface, the natnre of the soil from the enrface down—so far as known, the thickness of the different etrata, and any other facts likely to be of advantege to you and us in writing our letter of instructions. In any case where, from the statements of facts, we are satisfied water cannot he ohtained in eatisfactory supply, we shall eo state, and will immediately return your money.

We refer, hy permission, to: Chas. Miller, Esq., of Huntington, Hopkins & Co., junction of Bush and Market streets; Lemhert & Green manufaotnrers of H. & L. axle grease, 144 Natoina street; M P. Holmes, carriage manufactory, 327 and 329 Sutter street; Judge Robert Thompson, 76 Montgomery hlock; R. H. McDonald, President of the Pacific Bank. All of San Francisco.

For circnlars and other information, addrees BABCOCK, HOWARD & Co., 40 Merchants' Exchange, S. F., Cal.

NOTE.—No letter of instructione will be eent, except it ie eent with the goods.

Bullion Shipments.

We quote shipments since our last, and shall he pleased to receive further reports:

Hananer, 18th, $2,200; Germania, 28th, $1,500; Bullionville, 18th, $2,259; Horn Silver, 18th, $17,500; Tintic, 18th, $2,415; Barhee & Walker, 19th, $1,598; Horn Silver, 19th, $7,500; Hanauer, 19th, $2,300; Germania, 19th, $1,450; Leonore, 19th, $650; Moulton, 20th, $10,000; Horn Silver, 21st, $32,500; Bullionville, 21st, $2,059; Germania, 21st, $5,500; Hanauer, 21st, $2,300; Alice, 20th, $6,000; Horn Silver, 22d, $12,500; Bullionville, 22d, $14,709; Northern Belle, 16th, $4,548; Star, 13th, $3,020; Standard, 16th, $18,297; Contention, 14th, $17,403; Northern Belle, 18th, $2,761; Star, 16th, $2,862; Contention, 17th, $11,005; Tip Top, 17th, $10,000; Bodie, 23d, $8 500; Lyon, 18th, $33,450; Star, 20th, $3,253; Northern Belle, 21st, $5,057; Contention, 21st, $16,916; Leeds, 24th, $1,553; Eureka Con., 20th, $10,215.

New Incorporations.

The following company has been incorporated and papers filed in the office of the Superior Court, Department No. 10, San Francisco:

IMPROVED MACHINERY Co., Jan. 20th. Gbject, manufacturing, buying, selling and using machines of all kinds. Capital etock, $10,000,000. Directors, Hall McAllister, John Patten, Wm. R. Quinlan, Jos. Whitney and T. W. Ludovici.

GILMER-SALISBURY M. Co., Jan. 24th. Location, Lincoln Co., Nev. Capital stock, $10,000,000, in 100,000 shares. Directors, Jas. Heron, C. W. Banks, L. F. Rowell, S. D. Baretow and H. H. Hamer.

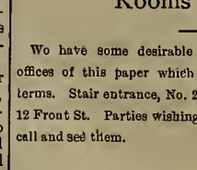
BODIE AND BENTON COMMERCIAL R. R. Co., Jan. 25th. Gbject, constructing a narrow-guage railroad from a point near Mono lake, in Mono Co., to the town of Bodie. The company propose to purchase timber lande on Mono lake, erect and operate sawmills, and transport the lumber therefrom to market hy means of their road. They aleo propose to conetruct a hranch road from the sonth end of Mono lake to a point connecting with the Carson & Colorado R. R., near Benton. Capital stock, $2,000,000, in 200,000 shares of $10 each. Directors, R. N. Graves, A. J. Ralston, H. M. Yerington, Thos. Menzies, Wm. Willis, J. B. Low and W. S. Wood.

LEVI ESTES, at one time a prominent, respected and wealthy citizen of Portlaud, was arrested on Monday, charged with aetting fire to Estes & Knott'a saw-mill, near Hnhhard's, ahout two months ago.

THE Bear mill, Deadwood distriot, Trinity county, is to be increaeed to 20 stampe, heing now 10.

Business Offices and Sunny Rooms to Let.

We have some desirable rooms to let adjoining the offices of this paper which will be rented on favorable terms. Stair entrance, No. 252 Market St. Elevator, No. 12 Front St. Parties wishing offices, etc., will do well to call and see them. DEWEY & CO.



Dewey & Co.'s Patent Agency and Newspaper Offices.

Dewey & Co.'s Patent Agency and the business offices of the Mining and Scientific Press, Pacific Rural Press, Pacific States Watchman and the Fraternal Record are now favorably situated at No. 252 Market Street. Elevator entrance, *No. 12 Front St., S. F.*

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

G. W. McGREW—Santa Clara county.
M. P. GWEN—Santa Cruz county.
J. W. A. WRIGHT—Merced, Tulare and Kern counties.
JARED C. HOAG—California.
B. W. CROWELL—Humboldt and Trinity counties.
D. W. KELLEHER—Merced, Fresno and San Benito.
A. C. KNOX—State of Nevada.
EDWARD A. WEED—San Francisco.

PERSONS receiving a sample copy of the MINING AND SCIENTIFIC PRESS *with this notice marked*, are requested to examine the merits of the same, and consider fairly its claims for support, and if consistent, subscribe for the paper through the P. M. or agent delivering it, or otherwise. We shall send it, on trial, at the rate of $4 per annum for any period the reader may wish. Please notice our terms elsewhere, and if desired, send for further samples and information. Those who can circulate this No. further to our advantage are invited to do so.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walle d with aquaria is constantly receiving accessions of new fish and other marine life. Tho number of sea lione is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

BOOKSELLERS, STATIONERS, ETC.—Messrs. Payot, Upham & Co., No. 204 Sansome Street, are one of the oldest, most enterprising and reliable firms in the book and station ery trade in San Francisco. Scientific, industrial and foreign publications are a specialty with them. They are also noted for their first quality of blank hook and fine station ery line of goods.

Sewing Machines.

Several first-class styles, good as new, will be sold at a bargain. Call on or address H. F. D., at this office.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $3 per (half-yearly) volume. In cloth and eather binding, $5. These volumes, complete, are scarce and valuable for future reference and library use.

THE State Mining Bureau, No. 212 Sutter street, is open to the public from 10 o'clock A. M., to 5 o'clock P. M. daily, (Sundaye excepted). Henry G. Hanks, State Mineralogist.

CORRESPONDENCE on mining and other subjects represented by this journal is solicited from all reliable sources. Send us information, early and often, if ever so brief.

BY TELEPHONE.—Subscribers, advertisers and other patrons of this office can address orders, or make appointments with the proprietors or agents by telephone, as we are connected with the central systemin San Francisco.

San Francisco Metal Market.

GIANT POWDER,

Manufactured under Alfred Nobels' original and only valid Patents for Nitro-Glycerine Powders, which has been and still is of such immense advantage to the Miner, Railroad Man and the Engineer. All other Nitro-Glycerine Compounds, for instance, so-called Hercules, Vulcan, Vigorit, etc., are simply imitations and adulterations of the original Giant Powder.

THE GIANT POWDER COMPANY

Manufacture three grades of Powder, which are the Safest and Strongest High Explosives in the market. The Original Nitro-Glycerine Compound

GIANT POWDER or DYNAMITE

Is acknowledged by all the great Chemists of the world as unapproached by any other Compounds, no matter under what names they may have been placed before the public, for instance, all Chlorate of Potash and Gun Cotton mixtures have been thoroughly tested and tried in Europe, and abandoned on account of their liability to spontaneous explosions.

The Judson Powder

IS A BLACK POWDER OWNED AND MANUFACTURED BY THE

GIANT POWDER COMPANY.

It is from Three to Five Times Stronger than ordinary Blasting Powder, and is used by all the Railroad and Gravel Claims, as it Breaks More Ground, Pulverizes Better and Saves Time and Money. It has therefore superseded the ordinary Powder wherever tried.

TRIPLE FORCE CAPS AND ALL GRADES OF FUSE FOR SALE.

BANDMANN, NIELSEN & CO., Gen'l Agts.,

San Francisco, Cal.

COTTON HOSE,

"RED CROSS," (Single Ply),
"PARAGON," (Double Ply),
"EUREKA," (Triple Ply).

Fire and Garden Hose,

(RUBBER LINED),

Prepared mildew-proof, and superior to the best Rubber Hose for durability and strength. CAN BE PUT AWAY FOR YEARS, AND THE STRENGTH NOT IMPAIRED. Makes the best deck hose for steamers or mining purposes yet made, and in use by all the principal City Fire Departments, New York City having 70,000 feet in active service. Also,

Rubber Lined and Unlined Linen Hose.

DEWEY & CO.'S

Scientific Press Patent Agency.

[ESTABLISHED 1860.]

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other Agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

WATER JACKET SMELTING FURNACES

For Galena, Silver and Copper Ores.

THE PACIFIC WATER JACKET SMELTERS embrace many features that are entirely new and of great practical utility, which are covered by letters patent.

No other furnaces can compare with these for durability, and in capacity for continuous and uninterrupted work.

More Than Fifty

Of them are now running on the Pacific Coast, giving results never before obtained as regards continuous running, economy of fuel, grade and quality of bullion produced.

These smelters are shipped in a complete state, requiring

No Brick or Stone Work,

Thus saving great expense and loss of time in construction.

Complete Smelting Plants

Made to order with all the improvements that experience has proved valuable in this class of machinery. Skilled and experienced smelters furnished when desired to examine mines and to superintend construction and running of furnace. Send for circular. Estimates given upon application.

Separating Gold, Silver and Copper from Lead.

In separating the gold, silver and copper from lead or base bullion, the practice is to melt the bullion in a suitable kettle and then add zinc thereto, forming thereby an alloy, which is richer in silver than the original bullion, and which is separated therefrom when the contents of the kettle are sufficiently cooled down for the alloy to solidify.

To effect the desired cooling the custom has been to draw the fire from beneath the kettle, to allow the latter to gradually cool down to the desired degree. This is a tedious operation, requiring several hours, and sometimes, in warm weather, even a day or two.

To provide an improved mode of separating the richer metals in question from the lead in base bullion, and that separation may be effected more speedily and with the use of a smaller amount of zinc than has hitherto been necessary, is the aim of an improvement devised by A. H. Meyer, of St. Louis, Mo., this consisting in chilling the molten bath only, meanwhile maintaining the application of heat to the exterior of the kettle.

In the engravings, *A* represents a kettle supported on the walls, *a a*, and heated by means of a fire beneath all in the usual manner. The base bullion is softened and tapped into the kettle, and the zinc added thereto. Then, to effect the cooling, a pipe, or system of piping, *B*, is, by means of the cord, *C*, and pulleys, *c c*, lowered into the molten bath, bringing the piping preferably very near the bottom of the kettle.

Hose connections, *D D*, are made with the piping, and water is sent through it, flowing in at *D* and out at *D*, and as indicated by the arrows. Any air in the pipes can be let out by means of the cocks, *E E*.

The flow of water, as described, causes the contents of the kettle to be rapidly chilled; in practice, not requiring over 15 minutes to cool the molten metal to that degree at which the zinc-silver-lead alloy solidifies.

This occurs at first in that portion of the bath which is in the immediate vicinity of the piping, the alloy collecting about the piping, together with some of the base bullion. The piping is then swung around in the kettle, so as to come in contact with all parts of the bath, bringing the piping into a position at right angles to that shown in Fig. 2, and into any desired intermediate position.

As the alloy and the base bullion upon the piping come in contact with the hotter base bullion, which occurs as the piping is turned around, the base bullion that has hardened upon the piping melts off and the alloy floats upward to the surface of the bath, where it is collected.

A special advantage derived from curving the pipes and carrying them down to the lower part of the kettle, as shown, is that thereby the molten bath is cooled down evenly. Formerly when the metal was allowed to cool by radiation, the surface of the metal cooled down in advance of the metal at the bottom of the kettle, and in consequence it required, in practice, a larger amount of zinc to separate the alloy than by the present mode, and a portion of the alloy also adhered to the shell of the kettle. Although the principal portion of the zinc is eventually regained, any increase in the amount necessarily increases the expense of the operation.

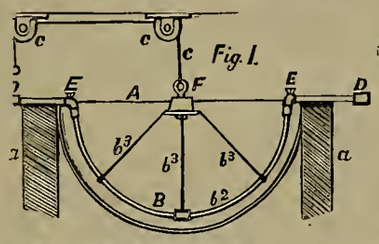
The rods, b^3, serve to brace the piping, to connect it with the cord, *c*, and also to support weight, *F*, which is used to keep the piping down in the kettle. The piping, *B*, which might be in the form of a hollow-flattened tube, or in any other shape suitable for carrying the water current through the liquid metal for the purpose described, is preferably in the form of the winding pipe shown.

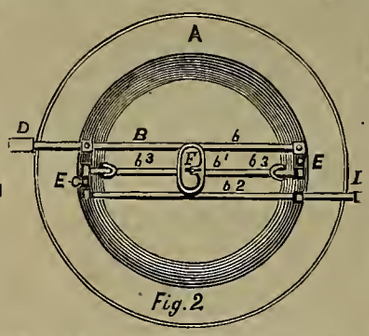
It is desirable, however, for the piping to be so constructed as to have an excess of cooling surface at the lowest part of the kettle, for in the present operation the fire is constantly maintained beneath the kettle, keeping the shell of the kettle warm and preventing the adherence of the alloy thereto; and hence, if the cooling surface of the piping were evenly distributed throughout the kettle, the molten bath would be overheated at and near the bottom thereof, and this difficulty would be increased by the radiation from the surfaces of the bath.

A New Door-Knob.

A large manufactory has been established in the East, which makes door-knobs of all variety of patterns on the principle shown in the accompanying engraving. From Geo. V. Blackman, the agent for this coast, 912 Broadway, Oakland, we learn that the knob is received with great favor in this city and Oakland, and wherever he has brought it to the attention of architects, or other experts.

As will be seen by the engraving, the spindle is threaded on one end, and fits into an internally-threaded slide-nut having a square head.





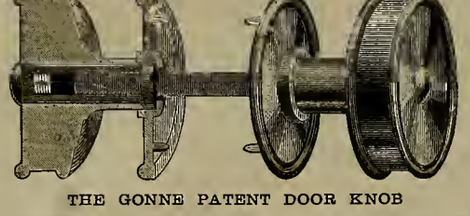
APPARATUS FOR SEPARATING GOLD, SILVER AND COPPER FROM LEAD.

In the end of the knob which fits into the threaded end, is a square socket fitting on to the head of the slide-nut. After the spindle has passed through the door (the rosse being held in place by the lugs cast on them), the slide-nut is screwed up by the end of the slide-nut fitting into the square socket of the knob. Then the roses are solidly held in place and the slide-nut is screwed up to a shoulder formed in the rose, as shown.

When this slide nut is screwed up tight, one knob and the spindle are held in place. The slide-nut is then turned so that the neck of the knob (socketed square inside) will slide over it and keep it from turning either one way or the other. A screw on the end keeps that knob on, and the knob keeps the nut in place, so the knob is then ready for use.

In this way the knobs are easily and accurately adjusted to any thickness of door, and no screws are used in the necks to secure the knobs to the spindle, the screw going through the end of the knob, and being large enough to be serviceable.

No screws are used in the roses, as the knobs are adjusted so the roses cannot become loose. No adjusting washers are used. The knobs cannot be pulled off, and are durable and simple in construction. In this there is a continuous bolt from outside to outside of each knob through the door, with a head on each end.



THE GONNE PATENT DOOR KNOB

ELEVATOR SAFETY BRAKES.—There are about 500 passenger elevators in New York, and among the passenger and freight elevators in the city and neighborhood, one wire rope breaks on an average each week, and a car is caught by the safety brake without accident. It is many years since a car missed its hold and fell to the bottom.

THE dividends of the Ontario, U. T., now foot up $3,950,000.

Discoverers of Mineral.

The case of Orion vs. Pendery was decided a short time ago by Justice Millar in the United States Circuit Court at Denver in favor of defendant. The Orion had been first located; but the Pendery, located subsequently on the same territory, discovered mineral in place before the discovery by the locators of the Orion claim.

Justice Millar, in delivering the opinion of the Court, said that the question submitted to the court is this: Can prospectors on the public mineral domain acquire any right in which the law will protect them prior to the discovery of mineral in rock in place; and if so, can plaintiffs, being prior locators, recover against defendant, who first discovered mineral on the ground in controversy? It is the opinion of the court that, inasmuch as the plaintiffs allowed the defendant to enter upon their claim and within their boundaries, and there sink a shaft in which he discovered mineral in rock in place before a discovery by plaintiffs, and make a location therefor, without protest, the defendant now has the better right. But the plaintiffs might have protected their actual possession of the entire claim by proper legal proceedings, prior to the discovery of mineral by the defendant or by either party. A prospector on the public mineral domain may protect himself in the possession of his *pedis possessionis* (foot-possession, so to speak) while he is searching for mineral. His possession so held is good as a possessory title against all the world, except the Government of the United States; but if he stands by and allows others to enter upon his claim and first discover mineral in rock in place, the law gives such first discoverer a title to the mineral so first discovered, against which the mere possession of the surface cannot prevail.

IN the Cababi district, Arizona, Indians are employed in mining. Recently, under the advice of a chief, they struck for 25 cents per day extra. They were receiving $1.25, and clubbed together for a raise of the extra quarter. They held out only one day and then went in at the old rates.

THE Northern Pacific, in the spring, will have one or more light-draft, powerful steamers on the Yellowstone, and will utilize the river for moving forward to Coulson iron and other material for track-building east and west to that point. A locomotive and flat-car will also be hauled up from Miles by the same method.

Hydraulic Gravel Elevator.

When the Hydraulic gravel elevator was devised by Mr. Cranston, a good many people were certain that it would not work. Miners, however, who had claims with gravel so low it would take expensive tunnels to bottom it, or who wanted to lift their gravel to get fall, felt that if this machine would work at all, it would be an extremely useful appliance, and that with it many claims could be worked which would otherwise be useless. Mr. Joshua Hendy, the well-known manufacturer of mining machinery in this city, took hold of the machine and brought its merits more prominently before the public, having confidence in it from the first.

The elevator is now in use in many mining claims on this coast. Giving it the requisite amount of water, it seems to give satisfaction. There are some points about it, however, not generally understood and, in fact, very few experiments have so far been made. A correspondent of the PRESS, who has been experimenting with the elevator for some time, writes us the following as rules for conducting and operating hydraulic gravel elevators: EDITORS PRESS: Allow me to call your attention to the following rules in connection with hydraulic gravel elevator:

1. Determine how high the water and debris is to be raised.
2. Allow 100 ft. of pressure to every 17 ft. of elevation to be made with the machine.
3. Determine the amount of water available for supplying the machine.
4. Determine the size of the nozzle to be used.
5. Multiply the diameter of the nozzle by three for the diameter of the throat of the elevator.
6. Multiply the diameter of the nozzle by four for the diameter of the discharge pipe.
7. Make the area of the opening at the base of the elevator the same as that of the discharge pipe.

The theory indulged in by hydraulic-elevator men, that it does not make any difference how large the discharge pipe is, I have found to be a mistake. That it will not hold good, I will convince any gentleman by actual demonstration, who will take the trouble to call at my residence, 867 Chester St., West Oakland.

The value of these elevators for pumping and raising sand, gravel and bowlders as large as will pass through the elevator is comparatively unknown, and is deserving of more attention from mining men than it has yet received.—ELEVATOR.

We hope if any persons who have been using the elevators have any further practical suggestions to make in this connection, they will make them public. A discussion of the subject will be useful, as the appliance is a comparatively new one, and any observations concerning it will be read with interest.

THE DEBRIS TRIAL.—The Gold Run debris trial, which has been going on at Sacramento for two months past, has, as far as taking testimony is concerned, been brought to a close. The case has been adjourned to Feb. 28th, when the arguments will be commenced. The Placer *Herald* says: "These, it is estimated, will occupy seven days, and the court is not likely to render its decision until a month, and possibly more, after the trial is finally concluded. In the meantime, it is reasonable to suppose that further litigation on the question will be stayed. But should the decision, when it does come, be in favor of the farmers, we may look for such a storm of injunctions against hydraulic miners as never before fell upon the heads of the prosecutors of an important industry. But should the decision be in favor of the miners, and this seems highly probable, judging from the character and weight of the testimony, what will happen then? Virtually nothing. The lawyers will have reaped a large fee at the expense of partisan interested."

Roasting Pyrites.

Chambers for condensing the fumes obtained hy roasting arsenical pyrites and sulphurons pyrites are ordiuarily construoted of hrick, the roof, which is of considerahle thickness, heing formed entirely of brick covered with stone, and the interior of said chambers heing divided hy transverse walls into compertments, whicb communicate with each other hy means of openings in the said transverse walls, the openings heing so arranged relatively to each other as to cause the fumes in passing through the said chambers to take a zig-zag course. Chambers thus constructed are not durable, the combined action of the sulphur contained in the fumes passing through them, and of rain which enters the roof at the interstices caused hy contraction and expansion rapidly destroying the materials of which they are huilt. The said chambere also act very imperfectly, owing to the retention of heat hy the said materials, much of the arsenic contained in the fumes, instead of heing condensed and deposited in the chamher, is carried out therefrom and lost, or if retained, is frequently so hurned as to he useless, and part of the sulphur contained in the said fumes is also carried out, and is converted into sulphurous acid, which canses the destruction of vegetation in the neighhorhood of the said chambers.

The object of the invention of Mr. H. N. Lay, C. B., and Captain Harry Bulford, of Celetock, is to remedy these defects, and for thie purpose they huild flues in the transverse walls of the chamher, through which flues currents of air from the exterior of the chamher pass, and they cover the said chambers with a roof of iron. By these means the heat ehsorhed from the fumes is rapidly removed, and thrown off from the chamber. In order to protect the iron roof from the action of rain they erect over it a light covering or outer roof of wood, iron, or other suitahle material, leaving sufficient spaco between the two roofs to admit of the free passage of air between them, and the free radiation of heat from the inner or main roof of the chamher. In order to prevent the rapid destruction of tbe brickwork of the chamher by the expansion and contraction cansed hy tbe heating and cooling thereof, they brace the outer walls together hy means of hars or rods of iron, which they pass through the air flues in the transverse walls, in order that the said bars or rods may be kept cool and out of contact with the fumes in the chamber. By thus hracing the walls they are enahled to build them of less than the ordinary thickness, and the radiation of the heat absorbed hy them from the fumes is consequently much faciliteted. Instead of forming the walls and the interior of the roof of the chember entirely of brickwork, they in some cases form a portion of the said chambsr near the end at which the fumes enter partly or entirely of iron. By this construction of the chamher the hurning of the arsenic or part thereof contained in the fumes is prevented, the heat of the fumes heing very rapidly lowered on entering the chamher. Chembers constructed according to their invention are cheeper in first cost then those of the ordinary construction, heside hsing considerahly more efficient and durahle.—*London Mining Journal.*

The Area of Nevada.

An extra Census Bulletin, compiled hy Henry Gannett, Geographer of the Tenth Census, is received. It contains tables showing the approximate areas of the United States, the several States and their counties. The compiler says he finds that the whole contour of the country is given hy surveye whose accuracy is unquestioned, excepting from Lake of the Wooda to Lake Superior, and from Schoodic Lake in Maine to the Atlantic coast. The State of Nevada, according to this hulletin, contains 110,700 square milse. Of this area 35 square miles are rivers and smaller streams, and 925 square milee lakes and ponds, making a total water surface of 960 square miles, and a total land surface of 109,740 square miles. Half of the houndary portion of Colorado river and that portion of Lake Bigler within the State line is included in the water surface area. The land surfece area, in squere milee, of the several counties ie given ae follows: Elko, 8,000; Churchill, 6,400; Douglas, 790; Esmeralda, 5,500; Eureka, 4,500; Humholdt, 18,000; Lander, 6,700; Lincoln, 19,000; Lyon, 450; Nye, 24,000; Ormshy, 180; Roop, 5,200; Storey, 470; Washoe, 1,150; White Pine, 9,400. It will he oheerved that Humboldt, which is the third county in eize, is 100 times ae large ae Ormsby, which is the emallest county in the Stete. Roop hae no organiztion and is attached to Washoe for judicial and other purposes. Thcre are 11,520,000 acres of land in this county.

F NEW VOLUME.—The MINING AND SCIENTIFIC PRESS commenced Vol. XLIV with ite issue of January 7th. The PRESS ie a complete cyclopædia of the mining evente of the Pacific slope, hesides containing iteme of interest of a general nature. It ehould he a regular visitor to every miner's cahin, ae well as to every husineee firm on the coast. May it continue long in its field of usefulnesa.—*Esmeralda Herald.*

OF the 580 etampe operated by the Homeetake company, Deadwood, 280 have heen hung up, owing to lack of water, and nnleee there ie rain or wet enow soon, the others muet cease work. Nearly all of the Central mille are idle.

Four Rare Trees of Arizona.

[Read before the California Academy of Sciences, by J. G. LEMMON, Oakland, Nov. 21, 1881.]

Two Pines, a Cypress and a Sycamore.

During the present and the preceding season the writer has contrihuted to the Botanicel Museum of the California Academy of Sciences specimene of several rare or little-known trees, collected in the mountains of Arizona, and which, for want of time or strength, have heen presented almost without comment.

Agreeahle to the request of several memhers of the Academy, an attempt will be made in this paper to give some points of presumed interest concerning a few of these trees.

But, first, it is necessary to assert, in the hearing of the ordinary traveler, that there are trees of any kind in the arid territory of Arizona. This consideration prompts to a few words of general description.

Arizona Territory comprises a large crosesection of that hroed interior region hetween the Rockiee and the Nevadas that is often miscalled the Great Basin. This region is characterized by areas of desert land, so-called, undulating plains of white or reddish sand, epacsely dotted with shruhs such as creosote bush, mesquite, palo verde, acacia, etc., plents that thrive with little water and that love the sun. Also, thie is the home, *par excellence*, of the cacti, of all forme end sizee from the little pincushion to the large and statsly tree cactus.

Rising out of these plains are bald mountains of many hues and shapes in accordance with their rock composition. Some of thsee mountains are disposed in long parallel chains, especially those in the north end of the Great Basin and mostly included in the State of Nevada. Southward in Arizona the mountains are generally so deeply submerged with send and gravel, the hed of a recent vast inland sea, that only a few of the most elevated peaks remain uncovered. Theee peaks are thus move or less isolated and separeted hy wide etretches of arid desert, and this isolation inevitahly leads to the production of peculiarities of its products, especially to differentiation and verieties of floral objects. As most of these mountains are not high and are but a few miles in circuit, with no living springs in them, their flora ie limited to dry-weather vegetation and such ennuale as are nourished hy the rains and coolness of a short winter and the few days of rainy eeeson in midsummer. It will he many years before hotanical exploration on this coast will be conducted so thoroughly as to comprise a complete knowledge of all tbe pecnliar plants that are annually spreading their petals to the sun ou those lonely mountains and telling to the untutored aborigines the etory of their mysterious origin, and revealing to his dull eyee the beauty of their peculiar forms.

Other Higher Mountains

Are usually found disposed in chains of several miles in length.

These chains are the more distinct vestiges of great suhmerged ranges that traverse the whole region parallel with the great Rocky end Nevada renges. These high chains are often of considerahle hreadth, and their outlying peaks frequently enclose valleye of great fertility, which are usually well forested on the north slopes as well as on the floors of the valleys, if high enough to he cool and well watered. In fact some most delightful parks have heen discovered, almost ineccessihle, fenced round with hristling peaks and upheld close to the sky and the stars.

It is in these alpine valleys and slopes that most of the new things are fonnd, the descriptions of which are fast appearing in hotanical journals at the East.

As stated in a former paragraph, many of the

Trees of our Great Sierra and Coast Ranges

Are found also on the highest mountains of Arizona. In several localitiee lumher factories heve heen in operation for yeers. An especially rich valley of pine timher is located in the Chiricahua monntains, utilized hy a large factory, which for years hae empplied the market of Tombstone.

Large plateaue of good timher are crossed hy the line of the Atlantic & Pacific R. R., near the middle of Arizona, on the parallel of 35°.

Theee forests are composed priucipelly of *Pinus ponderosa*, Douglas spruce and white fir, with several species of oak. Among theee trees, or apart from them, on the highest peake are found the rare and little known treee to he decrihed.

No. 1.—"Charles Wright's Sycamore."

Platanus Wrightii, Wateon—The eycamore is a small genue of hut six epecies; the only genus of the order of *Platanacea*, or broad-leaved plants; found only in the northeru hemisphere—two speciee being in the Levant, one in north Africa, one in the Mississippi valley, and along the Atlantic sea-hoard; a fifth epecies is found growing in the banke of lowland streams in California and Oregon, while a sixth very distinct species has lately heen detected ae growing along the lower washee of certain etreame of Arizona.

The eycamore ie alwaye a etriking ohject from its uenally very large eize, the smoothnees of ite bark, the epidermie heing removed annually, the great eize of its many lobed leaves, and the eingularity of its hutton-hall fruit hanging down on long pednncles. The Eastern species, *Platanus occidentalis*, is the largeet, though not the talleet tree in the United States, east of the Sierra Nevada. Specimene have been measured, in the hottom lands of the Ohio, that are 40, and even 50 ft. in circuit; more than 13 ft. in diameter.

Onr common California tree, *P. racemosa*, has never heen found so large, the largest measurement heing reported from near Los Angeles, of trees over 29 ft. in circumference. The new Arizona epecies is not a large tree—only 10 to 15 ft. in circumference—while much more of the epidermis remains on the trunk thau in other epecies. In other respects this tree differs most from the other two United States speciee in characters of the leaf and fruit. The leaf of the Eastern eycamore is very large, often 18 inchee to two ft. wide, and sinuate-lohed into three to five large divisions. The fertile ament is globular, ahout three-quarters of an inch through, and is eolitary upon a long, string-like peduncle.

The leaf of our California eycamore is smaller, very variahle, as regarde the number of lohes, usually five-lobed heyond the middle, densely tomentose when young, with white or rusty short hairs. The hutton-halls are about an inch in diameter, arranged in numhere varying from two to seven along a moniliform or necklace-like spike, which depends among the leaves.

The leaf on mature trees of the new species from Arizona is smaller, very acutely and deeply, 5 to 7-lohed with a little tomentum beneath. The lower lohes project hackward, and form a deep sinus around the long petiole, 2 to 5 inches. The raceme of fruit is equal to the length of the leaves, end is composed of three halls of about three-quarters of an inch in diameter.

History.

It appears that Charles Wright first collected specimens of this tree while on the survey of the United States and Mexican houndary in 1851–2, but not until recently was a careful examination given to the specimens, together with othere collected by later hotanists, hy Prof. Sereno Watson, at the Harvard herbarium. He found characters decidedly distinct from all known species, and published a description in "Contrihutions to American Botany," issued April, 1875.

We found *Plantanus Wrightii* eparsely along the streams flowing out of the Santa Catalina mountains north of Tucson, the Santa Ritas south of Tucson, the Patagonia mountains, on the Mexicen houndary, and especially fine trees, seemingly entirely at home in the Chirricahua mounteins, some in the north end of the range near Dos Cahases, others near the south end in Rucker valley.

No. 2.—"New Arizona Pine."

Pinus Arizonica, Engel—The pine family comprises a large numher of the most useful trees on the earth; justly entitling the family to the appellation recently given to it of "the heneficent pine."

There are found throughout the globe nearly 70 epecies of pine, 11 of which are in the Atlantic States, and 19 in the Pecific States, 7 of which are in Arizona. Not one of the Atlantic species extends to our division, and vice versa. Three of the Arizonians, however, are the most common species of California, namely, *Pinus monophylla*, Tor., *P. contorta*, Doug., and *P. ponderosa*, Dong. Two of the others, namely, *P. edulis*, Engel., and *P. Chihuahuana*, Engel., are found also in Mexico, and are hut little known, while the two remaining, *P. Arizonica*, Engel., and *P. reflexa*, Engel., have but lately heen discovered in Arizona and are, perhaps, local species limited to a few peaks.

Pinus Arizonica was first detected hy Dr. J. T. Rothrock while with Lieut. Wheeler's expedition through the horder Statee in 1874. He found a north ravine of the Senta Rita mountains, 40 miles south of Tucson, partly clothed with a kind of pine closely resemhling small trees of *Pinus ponderosa*, our common yellow pine eo ahundant iu the Nevadas; hut his tree hore its leaves in fasciclee of *fives*, instead of *threes*, as in the *ponderosa*. This aroused his suspicion, and he forwarded his specimens to Dr. Engelmann, with the remark that this trec was "the hest lumher of that region, end there called yellow pine." Dr. Engelmann eeized upon ite meager differences, and at once announced a new species, hut admitted that it hore too many charactere of *ponderosa*, and also some of a Mexican epecies, *P. Montezumæ*. It remained for other hotanists to gather other specimens from other peaks, and finally, for Dr. Engelmann himself to make a pilgrimage last Septemher to the original locality, and rceeive confirmation through hie own eyes of those wonderful deductions which the mastere make in their closets, hased upon fragmente of plants sent them by field hotaniets.

We firet met with the *Pinus Arizonica* on the summit of Mt. Graham, at an elevation of ahout 10,000 ft., and as a component part of a thin forest of pine, spruce, fir and juniper, forming a lovely open park on the mountain top. Thie was in August of '80. Dr. Engelmann declared the specimeue were very satisfactory, and rather etrengthened the supposition of distinctness. In Septemher, Prof. Sargent, of the Census Bnreau of Foreetry, with Drs. Engelmann and Parry as aseistante, arrived on this coast, and the two firet-named gentlemen went down to Arizona and with much effort climbed up into the Santa Rita mountains, to the altitude of 7,000 ft., found abundance of the pine in question, and hecame confirmed in the conviction that it was indeed a new species.

During the present year it has been collected in several localities, widely removed. In April, Mr. Priugle, employed hy Prof. Sargent, thoroughly explored the Santa Rita mountains, making full specimens of the *Arizonica*, its hranchee, cones, cross-sections of timher, etc., to he deposited in a New York museum.

In May, we found the puzzling tree sparsely inhahiting the deer park on the summit of the Santa Catalina mountains, mixed with a form of *ponderosa*, that also hore leaves in fascicles of fives. This led the writer to douht tbe distinctness of this species, and ceused him to desire to see it in still other localities. The wish wes gratified fully a few weeks after, when hotanizing the lofty range of Chirricahua mountains, in the extreme southeest portions of Arizona. In the little valleys on the north side of the highest peaks of thie nohle range, was growing this remarkahle pine, along with its usnal companion, the *ponderosa*. Here the diffsrencee were decidedly more marked. The *Arizonica* is always smaller, with darker hark hroken into smaller plates, glaucous-green hranchlets, and with shorter, narrower leaves, alwaye in fascicles of fives. In vain we sought for ahherant forms of thie species, or of the *ponderosa*, heside it. They certainly appear very distinct in this locality, despite the similarity of the coues, etc.

Both species have many features in common with four-fifths of all known pines, and forming the large eection called *Pinaster*.,

From the other emall section, *Strobus*, the first section ie distinguiehed as heving the conescales generally thicker, the upper exposed portion called the apophysis having a dorsal tuhercle called the umho, which is generally armed with a prickle; leaves 1 to 5 in a fascicle, their eheaths usually persistent; wood generally harder, heavier, and more resinous.

Characters Compared.

The ealient and seemingly distinctive characetere separating ponderosa and Arizonica may he thus compared:

Pinus ponderosa—A large tree, often 15 to 20 feet in diameter, with usually yellowish, grayieh, or reddish-brown berk, sometimes quite derk, generally divided by longitudinal fissures into large plates; cones often very large, 6 to 8 inches long; hrenchlets hrownish green; leaves usually long, 10 to 15 inchee, large end etrong, normelly in fescicles of threes. The species is of wide renge, from Alaska to Mexico, end eestward to the Rocky monntains. It is aleo exceedingly variahle.

Pinus Arizonica—A small tree not exceeding four ft. in diemeter, with dark, finely divided hark; small cones, 3 to 4 inchcs in length; gleucous-green hranchlets; leaves, 4 to 8 inches long, very elender, week, in fasciclee of fives. These characters are constant eo far as detected.

The only absolutely iuvariable distinction hetween the species is microscopic and was detected hy Dr. Engelmenn. He discovered that *Ponderosa* has the strengthing celle of the leaf near the epidermis and elso *around* the few longitudinal resin ducts, while *Arizonica* hae *none* around the ducts.

At two localities in Arizona thie *Pinus Arizonica* ie sufficiently ahundant and at so low an altitude, 7,000 to 10,000 ft., as to he ohtained hy lumhermen, who have erected factoriee and have manufactured considerahle quantities of lumber annually. Of course this lumher is not so free from knots ae are the immense, tall, limhless pines of our royal Sierra, hut as the timher is hard and durahle it serves many useful purposee in the mining and huilding enterprises of that fast growing community.

Principal Localities.

One of these localities is that so often alluded to in this paper—the large canyon coming out of the north eide of the Santa Rita mountains, where the specimens were first collected by Dr. Rothrock. A factory erected there eeveral years ago euspended operations only a few months ago, when the progress of the S. P. R. R. hrought our euperh Truckee lumher into Tucson at much less cost.

The other locality is in the distaut Chiricahua mountains, spoken of, wbere is found a deep, well-forested valley, or rather a broad canyon coming out of the north side of the highest peaks of that lofty range. A lumher factory there of eeveral saws is still ectively employed in getting out hoarde, planke and square timhere for the minee and buildings at Tombstone and vicinity. The principal treee of thie valley are *Pinus ponderosa* and Douglas spruce, hut treee of the new speciee are not unfrequent, and ere often of the largest size.

[TO BE CONTINUED.]

A DIFFERENCE OF SIX DEGREES.—The temperature of the water flowing from the mouth of the Sutro tunnel is hut 114° Fahrenheit eince the hydraulic pump at the Comhination ehaft hae heen running hy water and the cold stream added to tbe flow, whereas hefore it wae 120°. The air temperature has heen lowered in proportion.

NEW VOLUME.—The MINING AND SCIENTIFIC PRESS with ite iseue of January 7, 1882, hegins Vol. XLIV. The PRESS contains at all times reliable information concerning the mining and manufacturing intereste of thie coast, heeides items of intereet to all claeses. It hae our eincere wishee for its future euccess. May its shadow never grow lese.—*Lewis* (Nevada) *Herald.*

THE total nnmber of stamps in operation in Snmmit Valley district, M. T., ie 221, and the total capacity of the emelter is 220 tons.

MECHANICAL PROGRESS.

The Dephosphorizing Process an American Invention.

By a recent decision of the Commissioner of Patents of the United States, the priority of invention in what is known as the basic process for dephosphorizing iron, concerning which numerous references will be found in the back numbers of the *Manufacturer and Builder*, has been awarded to an American inventor, Mr. Jacob Reese, of Pittsburg, Pa. This decision will attract widespread attention and discussion from the importance of the interests that will be affected by it.

The basic process, by making available for the production of steel, pig irons high in phosphorous, which have hitherto been quite useless, promises to immensely extend the utility of the Bessemer process, and many metallurgists have not hesitated to pronounce it to be next to the Bessemer process itself, the most important discovery in siderurgy of modern times.

The decision referred to will not only deprive Messrs. Thomas & Gilchrist, the English metallurgists who have hitherto received the credit of the invention, of their rights to ownership in it in this country, but will also, very likely, give rise to serious complications of a business nature, from the fact that a "syndicate" of American Bessemer steel manufacturers has already purchased for a large sum the right to use the Thomes-Gilchrist patents, the most important of which have now been declared invalid. The effect of the decision on the introduction of the basic process here will only be developed by time. Meantime, Mr. Reese, who has come victoriously out of a severe struggle for his rights, is to be congratulated for his victory, won in the face of the severest opposition and discouragement.

As a significant fact in connection with Mr. Reese's present position, it is said that when at the meeting of the American Institute of Mining Engineers, in May, 1879, at which Prof. Maynard read a paper giving the first description of the Thomas-Gilchrist process, Mr. Reese arose and laid claim to having been the prior inventor of the process, his remarks were received with general mirthfulness. His victory in the face of this notable evidence of incredulity is all the more creditable to him.—*Manufacturer and Builder.*

PROTECTION FROM EMERY-WHEEL DUST.—One of the most common objections to the use of emery wheels is the inhaling of the dust arising from their use, as well as the particles of metal cut from the pieces being operated upon. This is but little more objectionable than the injury to the eyes from the presence of these same foreign substances. In Germany, masks are made of mica, that entirely cover and protect the face, and from which an air tube is carried around between the shoulders, where it is provided with a mouth-piece filled with a saturated sponge, through which the air supply is drawn. The mica is transparent, and not easily broken. In this country exhaust fans are sometimes used to carry away the dust-laden air, inducing a constant current of fresh air to take the place of that removed by the fan. This alone is not a protection against particles of considerable size that are liable to strike the face with violence, often seriously injuring the eye. It would seem probable that a combination of the two plans might work very satisfactorily.

KEEP YOUR BOILERS CLEAN.—Concerning cleanliness of boilers the *American Machinist* says: If dirty water is used in boilers of any kind, they should be frequently washed out. If they require it every week, it should be done. We remember an instance some months ago where a set of tubes were greatly damaged and several of the bottom rows burned out by reason of the dirt within the boiler. They were repaired, and the same thing occurred again. Finally, the suggestion was made to wash the boilers once a week if they were dirty, which suggestion was carried out, since which time there has been no trouble from that source. It has also been noticed that the valve seats and cylinders are not scratched as much as previously, and the boilers steam very freely, which, of course, reduces the coal consumption. Boilers should be always washed when they are dirty.

GOOD MECHANICS DO NOT "BLOW."—The true mechanic is not a blower. One may ride for hours in the cars, where all classes commingle, and it requires the closest scrutiny to detect the practical mechanic or call out his specialty. One of the pleasantest companions the writer ever met on the railroad sat and talked on several subjects, with a freedom not usual and with an intelligence uncommon, for nearly three hours, before the writer ascertained he was a mechanic, a machinist. The facts he cited, the arguments he suggested, the plans he commended, would have been valuable to a Congressman or a public speaker; and yet he never obtruded his business, and it was ascertained only when brought out by a direct question. And then the fact was elicited that this man was a very thorough mechanic, whose name, if mentioned, would be recognized by most readers.—*Boston Journal of Commerce.*

MACHINERY AND MECHANICAL SKILL.—The wonders of mechanism, says the Boston *Journal of Commerce*, have furnished material for essays, anecdotes, sketches, for lectures and lessons without number. The close imitation of sentient human judgment by insensate material when formed into acting machinery; the microscopic wonders of production in watch-making machinery—screws so small that to the unaided eye they appear like grains of minute seeds—the automatic handling of metals in process of conversion from mass to individual shapes; the exact reproduction of periods of time or of acts by machines which count, and register, and measure, and return: all these are admirable and admired. But the skilled workman makes possible the wonder-working machine. He must first make the initial screw, the first wheel, form the first gear tooth, lay out the first categories of levers, inclined planes, rotating wheels, and reciprocating movements that make a completed machine. It should always be borne in mind that the machine never improves itself; it is simply a reproducer; and even to continue to be a reproducer it must have its own waste supplied and re-supplied by continual additions made by the trained hand, backed and guided by the intelligent brain. So, when we are inclined to argue the progress of the race by the achievements of machinery in our day, let us never forget that these achievements are not only primarily the outgrowth of individual human skill, but must also be kept up to their present standard by individual human skill; and that no progress whatever can possibly be made without the perpetual presence and active operation of the skill of the individual workman.

APPLICATION OF FAURE'S ACCUMULATOR.—At Vienna, two engineers are said to be engaged in fitting up works for producing immense quantities of electricity by the hydraulic power of the Danube. This electricity is stored up, in accordance with Faure's method of accumulation, in boxes of various sizes, and supplied to manufacturers and tradesmen for the purpose of lighting and working machinery by electricity. Despite the immense cost of the plant and the very low price at which the fluid is to be sold to the public, the inventors expect to derive an immense profit from their work, and therefore to find capitalists to back them up to any extent. Besides storing electricity in boxes, it is intended to convey it by means of cables sunk in the ground. By a combination of both methods, storehouses of electricity are to be established in each district at Vienna, so that manufacturers, shop-keepers, sewing machine workers, etc., need but just take their boxes to the depot to have them filled with electricity in one or more days, according to the circumstances of the case. At the central works it is intended to make an immense shaft transmit the hydraulic power of the river to the shore, and there to produce the desired speed by means of multiple transmissions. To guard the hydraulic machinery from the effects of frost and ice, the gigantic shaft is to be laid down considerably below the level of the river; by this means the ice is prevented from touching the circumference of the water wheel even in the severest frost of winter. It is further contemplated to provide immense ice-breakers, to prevent the injurious effects of drifting ice.

NEW METHOD OF INLAYING WOOD.—A new method of inlaying wood has been contrived by a furniture manufacturing house in England. The process is as follows: A veneer of the same wood as that of which the design to be inlaid consists—say sycamore—is glued entirely over the surface of any hard wood, such as American walnut, and allowed to dry thoroughly. The design is then cut out of a zinc plate about one-twentieth of an inch in thickness, and placed upon the veneer. The whole is now subjected to the action of steam, and made to travel between two powerful cast-iron rollers of eight inches in diameter by two feet long, two above and two below, which may be brought within any distance of each other by screws. The enormous pressure to which the zinc plate is subjected forces it completely into the veneer, and the veneer into the solid wood beneath it, while the zinc curls up out of the matrix it has thus formed and comes away easily. All that now remains to be done is to plane down the veneer left untouched by the zinc until a thin shaving is taken off the portion forced into the walnut, when the surface being perfectly smooth, the operation will be completed. It might be supposed that the result of this forcible compression of the two woods would leave a ragged edge, but this is not the case, the joint being so singularly perfect as to be unappreciable to the touch; indeed, the inlaid wood fits more accurately than by the process of fitting, matching and filling up with glue, as is practiced in the ordinary mode of inlaying.

HOLLOW STEEL SHAFTS FOR STEAMSHIPS.—Hollow steel shafting has been in use in Europe for some little time; but it is only quite recently, we believe, that this principle has been applied to such heavy work as steamship shafts, which has quite recently been done by Whitworth & Co. On this system, a 10-inch shaft has a hole four inches in diameter, reducing the weight 16%, while the strength is only diminished by 2.56%. With a 5-inch central hole, these figures would be 25% and 4.25% respectively.

SCIENTIFIC PROGRESS.

Artificial Cultivation of Sponges.

Some time ago attention was called to the fact that several Austrian scientists had demonstrated the feasibility of artificially propagating sponge by actual experiments in the Mediterranean, with the fine sponges that grow there. The method they adopted was simply to cut the living sponges into small pieces, which were then attached, at suitable distances apart, to a framework of wood, which, when filled, was weighted and sunk beneath the surface of the sea. These sponge fragments were found not only to retain their vitality, but to increase rapidly in size, so that a few years sufficed to produce marketable sponges therefrom at comparatively trifling cost.

In view of the rapid exhaustion of the sponge fisheries in the Mediterranean, the foregoing demonstration was looked upon as of great practical value, and the Austrian government gave official encouragement to the conduct of a series of similar experiments. These were, unfortunately, nullified by the jealousy and ignorance of the sponge fishers, who foolishly imagined that their industry would thereby be injuriously affected, and they repeatedly destroyed the wooden platforms and their contents. The experiments met with such strenuous opposition from this source, that they were finally abandoned and, have never been renewed.

We learn, however, from the *Oil and Drug News*, that experiments in the artificial cultivation of sponges have lately been undertaken, and with very promising results, at Pine Key, Fla. The pieces of sponge referred to in this case are spoken of as being simply transplanted, and not cut into small fragments as in the Mediterranean experiments. These were found to increase in size from two to seven or eight inches in diameter within the period of seven months.

The suggestion is now made to transplant the finer Mediterranean sponges and attempt their artificial propagation, and there is little doubt but that it would prove more profitable to raise them in our own waters than to import them. The superior quality of the Mediterranean sponge, however, is largely due to the extreme clearness of the water in which it grows, and much care would have to be exercised in the selection of the situation in which to cultivate it. As the possible indication of an entirely new industry, the foregoing is worthy of notice.

Solvent Action of Canned Food on Tin.

This subject has lately been carefully investigated by Helmer, who announces through the London *Lancet* that tin, even when quite pure, is much more readily attacked by canned articles of food than is commonly supposed. He has made an examination of a large number and a great variety of such canned goods, and has found tin in comparatively large quantities in nearly all of the samples examined.

As examples, he states that acid fruits, such as peaches and cherries, corrode the metal to an alarming extent; but what is even more serious, he found that meats, and even condensed milk, take up and become contaminated with sensible quantities of the metal. He instances the case of a can of soup, which he found to contain 35 milligrams (about ½ grain) of tin to the pound; one of condensed milk which carried 8 milligrams (⅛ of a grain); and one of oysters, which contained 45 milligrams (about 7-10ths of a grain) to the pound. He found also, that soda water, and all other varieties of aerated beverages which he examined, and which were conducted through tinned pipes, contained appreciable quantities of tin.

Having established the above facts, we come now to the more directly interesting and important question, whether tin is injurious to health. On this point there appears to be still some room for doubt. To settle the question, Helmer made a number of experiments upon pigs, the results of which went to prove that while *stannic* compounds are harmless, *stannous* compounds acted as decided irritant poisons. As the tin dissolved in the various forms of prepared foods would exist in this latter condition, the above statements become decidedly important.

Clover Insects.

The American *Naturalist* has a notice of a small work on the insects of the clover plant by Mr. Lintner, the State Entomologist of New York. After an introduction showing, by quotations from Mr. George Geddes, the importance of the clover crop, especially to the people of New York State, he makes manifest the large increase of insect depredators on the plant. He then remarks upon the fact that no notice of clover insects appears in the reports of Dr. Fitch, his predecessor; which fact indicates the scarcity or the unimportance of the insects affecting the crop in Fitch's time. He next quotes from Kaltenbach's "Pflanzenfeinde" a list of 66 species affecting clover in Europe, and by way of comparison gives a list of our own species, which includes 33 lepidoptera, 3 coleoptera, 3 diptera, 5 orthoptera and 2 homoptera.

The *Naturalist* says: "It may be safely assumed that the number of species in this country affecting the plant, though not perhaps injuriously, will be at least doubled by future observation, and in coleoptera we feel confident that it will be quintupled."

WILD BIRDS RACING WITH THE CARS.—Several times I have noticed wild birds of different species flying along parallel with, and near a railroad train, in such a way as to suggest the idea that they were really trying to distance the iron horse. One day last spring, I was coming East from Sioux City, Iowa, on the Illinois Central R. R., when my attention was attracted to a couple of birds, which seemed to be making us a trial of their speed with the train. They were, as I supposed at the time, our smallest species of hawks—sharp, alert, powerful birds, possessed of a high degree of strength and endurance on the wing. They kept steadily on their course, a dozen rods from the train, for at least a mile and a half; but the train was too rapid for them, and they finally turned aside and went back in the direction whence they came. A strong head-wind was blowing at the time, and the birds, at some moments, seemed to sail squarely in its teeth, without fluttering a wing. I watched them with much interest, and I did not think I could be mistaken in the belief that they were really trying to beat the train in the race. Horses and dogs frequently race with railroad trains, and possibly the instinct for sport and excitement may also exist in the wild birds. *Charles Aldrich, Webster City, Iowa.*

A CANADIAN ACADEMY PROPOSED.—At the instance of his excellency, the Marquis of Lorne, the initiatory steps have been taken for the establishment of a Canadian Academy after the plan of the Academie Francaise, which consists of 40 men selected by the body itself from among the most notable men of letters in France. Lord Lorne has already set on foot the Royal Canadian Academy of Art, which will, we hope, yet grow to be a credit to the country, although had the number of academicians been somewhat smaller, the immediate honor of connection with it would have been more highly appreciated. The proposed academy is to be composed of six sections, representing English letters, French letters, history and archæology, mathematical and physical sciences, geological sciences and biological sciences. It is probable that the membership will be limited to 10 or 12 in each section. Dr. Dawson will likely be its first president.

HERR BERNBECK calls attention in the *Pharmceutische Zeitung* to a possible inconvenience resulting from the use of ultramarine in the coloring of wall papers. He states that a room covered with an ultramarine paper was observed to be tainted by a smell of sulphuretted hydrogen, the source of which long escaped detection. Eventually, however, it was associated with the paper, and a closer examination led to the conclusion that the ultramarine on the surface was being slowly decomposed under the influence of the alum in the paste used in hanging paper. This appeared to be confirmed by the fact that a piece of paper steeped in a very dilute solution of alum gave off sufficient sulphuretted hydrogen to be perceptible to the nose and to blacken lead paper.

CORRECTING STATISTICS.—Among recent publications of the census bureau is an extra census bulletin containing tables showing the approximate areas of the United States, the several States and their counties. It has been prepared by Mr. Henry Gannett, the geographer and special agent of the tenth census. It appears that of several States a number of estimates of area have been in use, differing from one another by thousands of square miles, and none of them perhaps traceable to any authentic source; while many of the results are palpably wrong, being so far from the truth that it is a source of surprise that they were not corrected before. A map defining the gross areas of the States and Territories accompanies this useful bulletin.

INFUSORIA IN DEW.—Mr. W. S. Kent states, in his "Manual of the Infusoria," that he gathered in a very foggy day in Regent's Park a quantity of grass saturated with "dew," and found in every drop squeezed from the grass great numbers of infusoria of different genera, such as Heteromita, Vorticella, etc., with *Rotifer vulgaris* and other rotifers, and numerous Amœbæ, Anguillula, and various diatoms, the collection as a whole being indistinguishable from the ordinary microscopic fauna of a roadside pond.

A CURIOUS electrical experiment is described in one of the French journals as follows: A small pasteboard box is provided with a glass lid, which is coated on the upper surface with one or more thin layers of collodion, but not enough to render it opaque. A number of figures representing insects and the like, and made of cotton or sponge, are placed within the box. When now the collodion surface is rubbed with dry fingers in dry weather, the insects are made to move about in an interesting manner as they become electrified.

AN AMERICAN SCIENTIST HONORED.—The University of Cambridge, England, has conferred the honorary degree of Doctor of Laws upon Prof. Thos. Sterry Hunt, L. L. D., F. R. S., a native of Connecticut, who was for 25 years chemist and mineralogist to the Geological Survey of Canada, and resigned that post in 1872, to accept the Chair of Geology in the Massachusetts Institute of Technology.

STUDENTS of Kant are offered a prize of 1,000 florins for the best popular treatise on that philosopher's views on the ideality of time and space. Herr J. Gillis, of St. Petersburg, will not only give that sum, but will publish the successful essay and pay the profits on its sale to the author.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Bullion, of Paradise, Jan. 28th, $1,340; Silver City, 28th, $1,306; Germania, 24th, $2,500; Hanauer, 24th, $2,100; Stewart, 24th, $4 000; Bullionville, 24th, $2,096; Horn Silver, 25th, $22 500; Hanauer, 25th, $$,100; Germania, 25th, $1,500; Horn Silver, 26th, $2,400; Hanauer, 26th, $2 000; Germania, 26th, $1,400; Horn Silver, 27th, $10,000; Bullionville, 27th, $3,-204; Hanauer, 28th, $2,150; Germania, 28th, $2,450; Horn Silver, 29th, $27,500; Bullionville, 29th, $2,109; Northern Belle, 23d, $21,814; Standard, 23d, $32,176; Silver King, 22d, $24,-000; Noonday, 17th, $6,555; North Noonday, 17th, $6,176; Contention, 23d, $9 884; Star, 23d, $3,095; Northern Belle, 26th, $6,242; Eureka, 21st and 24th, $10,647; Manhattan, 27th, $22,851; Bodie, 30th, $8,508; Star, 27th, $3,-412; Eureka Con., 26th, $3,304; Contention, $20,314.

THE coinage executed at the United States Mint during January aggregated 7,734,360 pieces, valued at $6,276,000. Of this amount there were 285,600 eagles, 556,760 half-eagles, 1,000,000 silver dollars, 722,000 five-cent pieces and 5,170,000 cents.

MINING SHAREHOLDERS' DIRECTORY.

Mining Share Market.

Our mining stock tables show the fluctuations for the week. Explorations on the Comstock continue, but no bonanza shows itself up as is hoped for. Still there are several mines where something may show up any time.

The main incline of the Savage mine has been drained, and work has been commenced at the bottom. The raise from the 2400 level is now up about 20 ft. The water was drawn off through a hole run with the diamond drill. Before commencing the upraise, the drift from which it was to be started was run some feet north of the point where the incline will come down. From the end of this drift a drill hole was run which tapped the bottom of the incline. A close partition was put across this drift at a point north of where the raise was to be started, and the water from the drill hole was led into a covered drain under the floor. By means of this arraugement all the steam and heat is kept away from the men at work in the raise. But for this it would he fearfully hot in the raise, and the steam would he almost blinding. As it is, the floor is so hot that it almost burns one's feet to stand upon it. Now that work is progressing in the incline, both above and below, the connection will soon he made. It will he a very important connection for the Hale & Norcross, and, indeed, for all the middle mines.

The Horn Silver mining company, of Utah, has just declared a dividend of 3%, amounting to $300,000, payahle at New York, Feh. 15th; a similar dividend was paid Nov. 15th, and two dividends of $100,000 each prior to that time. The dividend next month will make $800,000. The mine has been put in good shape for steady working and good profits.

The Vizina Consolidated mine produced 675 tons of ore in Decemher, of which 452 tons were milled, yielding $41,618, showing an average of $92 07. The mill was started about ast July, and up to the close of 1881 there had been 5 664 tons ofore milled, yielding $524,900. The mine is now considered to he on a dividend-paying hasis. It has already paid four monthly dividends of $20,000 each.

A dispatch from Tombstone dated 29th, Jan. is as follows: The trial of the case of the Contention vs. the Head Center closed last night. The jury to-day rendered a verdict adjudging to the Contention a large portion of the Head Center, including the hoisting works on that mine. The ground includes all the valuable portion of the Head Center mine, but is not all that the Contention sued for. The verdict is looked upon as a compromise, and seems to he satisfactory to both sides.

The hullion output of the Idaho quartz mine, of Grass Valley, for January (a long month or five weeks) was $75,000. The usual dividend of $7.50 per share will he paid, and enough will he left to carry over a large surplus.

Meetings and Elections.

SIERRA IRON CO.—Jan. 28. Trustees—P. N. Lilienthal, J. Banjamin Chas. Kohler, F. McKnight, President, P. N. Lilienthal; Vice-President, Chas. Kohler; Secretary, H. Fe Bu-h; Treasurer, Anglo-Californian Bank.

SILVER STAR MI. Co.—Jan 28th. Directors—E. W. Asbby (President), S. T. Lathrop (Vice-President), J. F Broadhead, H. J. Spear, A. M. Wing. J. W. McClung (Secretary.) Tha Silver Star is located in Gila county, Arizona.

PACIFIC SOCIAL SCIENCE ASSOCIATION.—Presideut, C. T. Hopkins; Vice-Presidents, Alvan Flanders and M. R. Leverson; Recording Secratary and Treasurer, William Royal; Corresponding Secretary, F. B. Perkins. Trustees—C. T. Hopkins, E. W. McGraw, A. McF. Davis, G. K. Porter and Thomas L Taylor. Committea on Admissions, B. B Redding, D. C. McRuer, S. W. Holdaay, C. A. Wasbburne and Dr. A. B. Stout.

PACIFIC ROLLING MILLS CO.—President, Wm. Alvord; General Manager, L. B. Benchley; Secretary, C. M. Keeney; Superintendent, Patrick Noble.

MANHATTAN S. M. CO.—Feb. 2. Directors—A. K. P. Harmon, B. W. Paxtou, C. G. Gibbs, Melville Curtis, E. B. Pond. Tha Secretary's annual report shows that during the year the company received $2,354,049.52 and disbursed $2,358,892 15; casb on hand, $4,160.25.

New Incorporations.

The following companies has been iucorporated and papers filed in the offica of tha Superior Court, Department No. 10, San Francisco:

Gold Alda M. Co., Jan. 28. Location, Nevada. Capital stock, $1,000,000. Directors—P. A. Barney, W. H. Stanley, Joseph Nash, J. C. Plunkett and A. W. Blair.

Inyoreka M. Co., Jan. 28. Location Inyo Co., Cal. Capital stock, $10,000,000. Directors—H. T. Graves, F. B. Wilde, C. P. Chesley, J. W. Shaeffer and W. D. Jobnaton.

Pacific Electric Co., Jan. 28. Object, manufacturing and dealing in electro-galvanic belts and other electrical appliances. Capital stock, $50,000. Directors—Charles H. Wbeeler, A. T. Sherwood, H. W. Hendricks, E. L. Willard and F. B. Rae.

REVIEWING its various articles on the anti-Mormon hoom, the New York *Tribune* says: There is a fair prospect that some action will he taken by the present Congress by which the Mormon evil may he effectively reached at last.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to tha mines mentioned.

CALIFORNIA.

ALPINE.

STELLA.—*Mountain Argus*, Jan. 28: The work in the Stella mine is progressing very auspiciously. Wa are informad that they bava an immense body of rich ore at tha mine, and the mill is working up to from 85% to 90% of tha assay. The company bave shipped three bars of bullion already, and will ship more next week. Cy. Lebrecque passed through town yesterday, having in his charga upward of 8 tons of cement copper, from the Stella mine, which is to be forwarded to Dayton, Nevada.

AMADOR.

VOLCANO.—Cor. Amador *Ledger*, Jan. 24: Richardson & Canley, who have been prospecting around here for some time, bave found their bonanza in tha shape of a fina quartz ledge, showing frea gold, at a deptb of 12 ft. The owners of the Golden Gate have come to the conclusion that it is useless to wait for water sufficient to run the mill, and bava started the machinery with steam. The De Soto, at Pioneer, bas been abandonad on account of the paying ore having run out.

SUTTER CREEK.—Amador *Dispatch*, Jan. 28: The Saaton mill commenced crushing ore last week. They are using one of Donnelly & Co.'s water-power wheels, under 230 ft. pressure. Forty-two inches of water is all that is required, and everything is running very satisfactorily. The Hazard mine, owned by Alvinza Hayward, will commence operations this week. They intend to run a tunnel into tha hill, for the purpose of striking the lode. This mine is on the main belt or mother lode, and adjoins the Bunker Hill. H. Reese, an old and experienced miner, will have charga of the work. Monday of this week was pay day at the Con. Amador mine. They were paid for two months, and consequently the boys are very flush and are making it lively.

THE JOHN BULL.—Tha rich strike at the John Bull diggings, of which mantion was made last week, still continues to be mora satisfactory as the work of development proceeds. They bava cut into the ledge a distance of 10 ft and have not yet reached the hanging wall, therefora it is not yet known how thick the ledge is.

CALAVERAS.

SURFACE MINING.—*Echo*, Jan. 23: Gen. Beauregard, alias Ruba Stevens & Co., are now engaged in surfaca mining near Angels Camp. Tha General tells us that the mine prospects well, but owing to the scarcity of water he will be compelled to dry-wash for a time. The process of dry-wash may not be generally understood by the public, therefore some explanations may be necessary in order that a thorough understanding may ba arrived at. The General says that he first digs the dirt, leaves it to dry, then pulverizes it thoroughly, passes it through a windmill of his own invention, by which means he says the dirt is blown away, and the gold is collected in ona huge heap. This machine is simple in construction, easy to work, and obviates the necessity of using quicksilver. Ha intends soon to apply for a patent for his mill.

EL DORADO.

CLIPPER.—Georgetown *Gazette*, Jan. 28: The Clipper quartz mine, a few miles above town, bears a good raputation among the most practical miners of this section, notwithstanding tha failure of tha company who undartook to work it over a year since under Supt. Beardsley. It is said that the rock was paying $12 a ton when they shut down. The failura is attributed to bad management. With proper management the Clipper can be mada to pay handsomely. This is the general opinion of those acquainted with tha mine. The parties who workad this mine prior to the above company ware all practical working miners, and they made the rock pay. Thoro are plenty of such men to-day ready to take bold of tha Clipper if they could lease it on reasonable terms.

THE wintry weather of the past few weeks has caused an almost total suspansion in mining operations on this divide, and items of interest are consequently scarca.

THE Bright Hopa mine, a mile northeast of town, was located one year ago, at which time no quartz claim adjoined it. Since, three successiva claims have been located on its south and town on its northern extension, and one touching it on the southeast. The Bright Hope is an example of what continued and energetic prospecting will do. At first tha prospects were small, but they gradually improved as the mine was developed in depth, and to-day this mine promises to become a good property. The lode is from 7 to 9 ft wide, and 500 ft of the lode prospects very evenly. The owners believe that the ora will mill $8 right through, although they are taking out considerable $12 rock. We mention this merely to show what can be done by staying with a mina and developing it.

Careful and untiring prospecting frequently rewards the quartz miner for his time and patience. Therm are several good quartz mines in this district which only await careful development to make them a good paying property. We believe this, and not only do we preach it through the little *Gazette*, but devote more than one-half of our time in the practical use of the pick, shoval, drill and pan.

BIG MINING SALE.—*Mountain Democrat*, Jan. 28: Prof. Thomas Price, of San Francisco, has purchased from John Blair, of this city, tha Rose, tha Chester and the Gregon Hill mines, drifts into which will be started soon from the 600 level of the Placerville Gold Quartz Co.'s claim, and there is good reason for predicting that within thra months there will be at least 150 miners at work in exploring and developing these fine properties.

INYO.

BROWN MONSTER.—Engineer Wm. Hedge returned yesterday from the Brown Monster mill, where he has been engaged in repairing the penstock and water-wheel. Tha mill is to be started up, or at least one battery of it, on 200 or 300 tons of ore from mines belonging to Messrs. Reynolds, Thorpe and others. In the meanwhila Alex Clark is making a thorough clean-up of the mill, at a very considerable profit to all interested.

RICH GOLD ORE.—Si. Reynolds and Tom Treglore brought in yesterday a very fine specimen of gold quartz, taken from their claim called the Ranger, which is situated a little north of the Brown Monster and Hirsch mines, in the Inyos The specimen is as large as a man's fist, and shows free gold in 20 different places; some of it quite coarse. The vein is said to be 2 ft wide and shows rich quartz throughout. There are several fine gold prospects in the locality of the Ranger, which are very conveniently located for working, and we expect to see some good paying mines opened in that section during the coming year.

A MINERAL PICTURE.—Mr. Woodhull, of the assay office, has been getting up a beautiful case of minerals, set in a frame 14x18 inches. The case contains 100 different selected specimens of ores, from as many different mines located in Inyo county. The specimens are about 1 inch square. They are of various bright colors, and are neatly cemented upon an ornamented background. The contrast of the colors, and the flashing of the light from the faces of tha crystals makes altogether a handsoma ornament.

THE EAGLE MINE.—This mine is owned by Geo. Desalier and Phil. Cartiar, who have been hard at work on this claim for tha past month. The Eagle is situated in Mazourka canyon, and is very conveniently located for working. Tha ore is of a smeltiog character and soma of it assaya over 100 ounces of silver per ton. A shaft is being sunk on a fina vein of ora over 2 ft in width, which can be traced several hundred ft on tha surfaca.

BEVERIDGE.—Supt. Fuentes has arrived from Lona Pinn from his San Francisco trip, with the intention of immediately startlug up work on the Keynot mina to supply ora for the mill and arastras.

CERRO GORDO.—Sam Cowles bas returned to Cerro Gor-

do, after an extended trip through most of the Eastern cities. He says there is no place like California, and is glad to get back home. Diaz is working five men in the San Lucas, which is looking well. Crapo is prosecuting developments on his section of the old Buena Vista ledge. Hoff has a fine body of ore in the Osceola.

MARIPOSA.

THE MARBLE SPRING MINE.—Mariposa *Gazette*, Jan. 28: Capt. Utter, who returned to Mariposa on Thursday evening last, came from Yosemite valley by the way of Blacks on Bull creek, the Marble Spring mine and Coulterville. He says the Marble Spring quartz mine, formerly known as the Compromise mine, owned by A. G. Black and sold by him to a company who have a 10-stamp mill, have with in the last day or two in the mine, struck some exceedingly rich ore, which is exciting the admiration of all who can avail themselves of seeing it. It appears that the ree at find was a rich pocket, which was discovered by a Chinaman, who, what he couldn't carry away, covered up, and was doing this kind of business when it was found out by the foreman, who had been absent at the time it was discovered. How much John got away with cannot well be ascertained. At any rate a pan of dirt taken from the spot covered up, washed out upwards of $100.

THE OLD BUNNELL MINE.—This mine, located a short distance from Black's hotel, on Bull creek, now owned by Peter Longhurst, is turning out excellent rock, which will soon be put to a crushing test and the result known, of which there is but one opinion—that it will be a paying enterprise.

THE REED TALC MINE.—This mine, we are pleased to learn through Capt. Utter, who has just visited the locality, where he was kindly waited upon by Mr Shreve, the gentlemanly owner and manager of the works, and was shown sufficient to convince any one that the enterprise is an undoubted success. The patent pulverizer now completed and in order, has a capacity for pulverizing 30 tons of talc per day.

NEVADA.

SARGENT & JACOBS' CLAIM.—*Transcript*, Jan. 27: Work has been resumed this week at Sargent & Jacobs' drift mine after about three months' idleness. The water is all out, and a Sturtevant blower was taken up yesterday so the mine may have plenty of good air hereafter. The shaft is 233 ft deep, the main tunnel 600 ft long, and for some time before operations were suspended last fall the air was so foul that the men could not work to advantage and their candles could not be kept burning while in an upright position. The gravel was improving rapidly in quality and quantity when the last work was done.

PLACER.

HUMBUG FLAT ITEMS.—Placer *Herald*, Jan. 28: The Crater mill started pounding away recently on 60 tons of fine looking rock from the Muring and Schnabel mine. The men who have been re-timbering the Crater shaft have completed the job, and are now out of employment. Wood, and poor wood, at that, brings $5 a cord at the Crater hoisting works. Jo. McLaughlin is taking out some handsome specimens from surface croppings, about a mile north of Ophir. Lew. Kittler and his partner are building an arastra on a new plan, which will soon be completed. There are a good many prospectors in this locality. Some are doing well, and most of them, it is gratifying to state, have encouraging prospects. Wm. Pellow and L. Hutchinson are sinking on a ledge west of the Crater that looks very well.

PLUMAS.

PROSPECTING.—Greenville *Bulletin*, Jan. 25: The fine weather of the past week has been unusually favorable for prospecting, and more of that work has been done than at any former period. From all sides, reports are coming in almost daily of good prospects being found in both quartz and placer claims. Beyond all doubt, the coming season will be the busiest ever seen in this district.

LEADS.—A report comes that Mr. Hinchman has found a large and fine looking ledge near Mr. Stampfli's place. James Monroe has lately found, near his placer claim, a gold-bearing quartz ledge, which prospects well. The vein is 5 ft wide. Another report is current that a certain young man, who lives at Crescent Mills has discovered a very valuable ledge on ground belonging to the Green Mountain M. Co., and refuses to tell where it is unless paid $500.

COPPER.—In a small canyon, opening on Light's canyon, Messrs. Ford have men at work opening a copper ledge. Four days ago parties visited the mine and found a cut across the vein, which is 40 ft wide. The whole mass of rock is full of copper. The ledge was first seen in the bed of the brook, from which it rises in a slanting direction up the mountain, cropping out for a distance of 1,000 ft or more. The fracture of the rock is like brightly polished copper, the metal being in excess of all other matter in the mass. Everyone who looks at the specimens is astonished at their beauty. Mixed with the ledge matter is a large quantity of soft, black material, which is supposed to be silver ore; some of this has been sent to Oakland for analysis. The mine is called by the name of "Bull on." Not so far up the canyon is another copper ledge, called "Enterprise," owned by the same parties. A shaft has been put down on this ledge to a depth of 42 ft, in ore all the way. Some time ago a lot of this ore was hauled away, and $8,000 worth of copper smelted from it; but owing to the depreciation in the value of the metal soon afterward, and the owners of the mine not having capital to invest in the erection of smelting works, all further work on the ledge was stopped. This whole region is filled with valuable minerals of various kinds, and only needs capital for its development.

THE LEAVITT CLAIMS.—Plumas *National*, Jan. 23: On Monday we took a look over the claims of Leavitt & Brown, at Newtown, and found the work going on in good shape and things progressing at a lively rate. Last fall the owners took out good pay, working to an old drain tunnel which was run years ago, but it was found that the ground was to deep for the drain, and a new one was started and rapidly pushed through. The new tunnel is 1,000 ft in length, and is now in bedrock some three ft, the top of the tunnel is in splendid looking gravel which pays well. A couple of week's work will put it through into the ground that it started for, and then the working force will be increased as fast as room can be made for the men. The dirt is raised to the surface with a horse-whim, and everything shows that the owners know what they are about. They have a large section of rich ground above them, and will take out lots of dust in the next 12 months. Several claims adjoining them are known to have the same channel, and it is probable that work will commence on most of them with the coming spring.

SHASTA.

NEW MINES.—Shasta *Courier*, Jan. 28: A visit to the new quartz mines discovered near Middletown, convinces us that the ledges are not only rich in free gold, but are well defined and have every indication of permanency. The principal ledge has been traced a distance of half a mile by the croppings, which are from 1 to 6 ft in width. Free gold is visible in nearly all the croppings, which pay wages to men working with hand mortars. All of the ledges have been located upon and notices posted thereon. If the main ledge is only half as rich as anticipated, the prospects are that Middletown and Centerville will soon be rivals for the county seat.

LOG.—The recent strike of rich ore in the Chicago mine is the most interesting event to us at present. The ledge is 2 ft wide, the whole of which will go well into the hundreds per ton. The find is on the surface south of the old work. The cut and tunnel has exposed the vein for 20 ft, showing quartz in the face generously sprinkled with native silver. The new shaft of the Bullion is down 26 ft on a 4-ft ledge, showing an increasing quantity of mineral-bearing quartz as depth is attained. J. E. Strong is working on a small vein of good gold ore near his place. Crum's arastra is running on quartz from W. G. Cooper's ledge. E. Meeke is working on a vein near the old Atlantic, and taking out some good ore. Geo. Cunningham is also taking out some good quartz near the falls. E. L. Bullou's arastra is running on good ore, with an abundance in sight in the Manzanita, and hope to keep it going for some time to come. The Continental Con. has labored under many difficulties, but with plenty of the kind of ore that is now coming from the mine their success will be assured.

SIERRA.

A RICH STRIKE.—Sierra *Tribune*, Jan. 28: At the Marguerite quartz mine, located at Loganville, this county, a rich streak of ore was opened out last week. It is said that one piece taken from the ledge contained $1,700, while all the milling ore assays $200 to the ton. This is very encouraging for the owners and Sierra county, the company having worked their property but a short time.

THE ALASKA.—The Alaska Co.'s 20-stamp mill at Pike City, which has been under repairs for three weeks past, started up again the latter part of last week. The prospects of this mine continue as favorable as heretofore, and if no change for the worse takes place in the character of the ledge, it may be expected that this property will soon be placed on a dividend-paying basis.

THE CENTENNIAL.—The Centennial Co.'s drift claim at Minnesota still continues to improve daily. From two pans of dirt taken out of the sluices last week, more gold was found than the result of any week's washing heretofore. The owners are all in high spirits, and are very confident they have struck the true pay channel.

RUBY.—*Mountain Messenger*, Jan. 23: The Ruby tunnel is still going south of east, at a hight of 60 or 70 ft above the main tunnel. No work is being done in the main tunnel. The Suffolk M. Co., of Wahoo, has bought the old Pioneer ditch, which was originally intended to bring water from Gold lake. Only a portion was ever finished.

NEVADA.

WASHOE DISTRICT.

GOULD & CURRY AND BEST & BELCHER.—*Enterprise*, Jan. 30: The west crosscut, 2300 level, was advanced 45 ft; total length, 628 ft. The drill-hole from the face of the northwest drift is in 185 ft.

HALE & NORCROSS.—The northwest drift on the 2500 level is in 84 ft, having been advanced 18 ft during the week through the same character of ground. Have been repairing the winze and changing the donkey pumps.

CON. IMPERIAL.—For the past week most of the men have been employed for the Exchequer Co. The east drift 2300 level, is now in 160 ft from the south winze, the face in a mixture of quartz and porphyry.

EXCHEQUER.—During the present month the north drift, 2800 level, has been cleaned out, repaired and timbered, a drain dug and covered for a distance of 200 ft. Are now within 20 ft of the drill-hole where the water is coming from. Have now encountered a small cave, but expect to get the entire drift cleaned out and repaired in a short time.

GYERMAN.—East crosscut has been extended 45 ft through hard porphyry. Have cut and put in 60 ft of covered drain. Sutro tunnel drift has been extended 64 ft; total length from point "A," 802 ft. The drift having reached our north line was stopped to-day. The Sutro Tunnel Co. will connect with us by the 5th proximo, if not before, as there is probably less than 50 ft between the face of our drift and the face of theirs. At Forman shaft the excavation for tank and pump at 2300 level is nearly completed, and we will commence placing the pump the first of the week.

BLIND MOUNTAIN DISTICT.

MIDNIGHT MINE.—Pioche *Record*, Jan. 21: This mine, of Blind Mountain District, has a vein of very rich ore, from 4 to 8 inches wide, in the face of the drift now being run. Some rich specimens were brought in from there the other day.

CANDELARIA DISTRICT.

NORTHERN BELLE.—*True Fissure*, Jan. 28: Eight ft have been added to the depth of the main shaft during the week, and 3 sets of timbers have been put in. The total distance made to the 23d instant was 25 ft. The levels above the adit continue their usual production. There are being extracted and sent to the mill about 63 tons of ore daily. The mill was stopped 2 days during the early part of the week to clean flues and repair the furnace, but has been running steadily since. Bullion shipments for week ending Jan. 26th, $16,115.04. Shipments on January account to Jan. 20th, $49,383.91.1

MOUNT DIABLO.—The east drift has advanced 14 ft, showing small streaks of ore which assay $120 per ton. The stopes above this drift look very well, and are giving considerable ore that will mill $75 to $80. Some good ore has also been taken from below the third level, is the west drift near the head of winze No. 1.

PRINCESS.—The re-timbering of the shaft has progressed for a distance of 75 ft, much better headway being now made than at any time previous.

EAST MOUNT DIABLO.—Since the arrival of the new superintendent operations on this property have taken a very energetic turn.

ESMERALDA DISTRICT.

THE CORTEZ MINE.—Esmeralda *Herald*, Jan. 28: Work is progressing as usual in the mine with most gratifying results. In the drift running toward the Utah a body of good ore has been encountered. In all other parts of the mine where work is going on the prospects are flattering.

UTAH MINE BONDED.—We learn from T. H. Wells, superintendent of the Cortez, that Leonard Richardson, of New York, and he have just accepted a bond from Judge W. M. Seawell and Geo. W. Dorn, for a deed to that famous early-day bonanza, the Utah mine, which adjoins the Cortez; the deed to be given on or before May 1, 1882, on payment of $40,000, of which $5,000 is to be paid in 8 days, and to be forfeited if the purchasers fail to pay the balance. This shows great confidence in the Utah on the part of Messrs. Richardson and Wells, which is no doubt well founded, judging by the Cortez. The property has fallen into the hands of enterprising men, and the people of Aurora rejoice.

EUREKA DISTRICT.

BONDED.—Eureka *Sentinel*, Jan. 27: We learn that the Mountain Boy series of mines, owned originally by the old Richmond company, organized in New York in 1860, and reorganized in 1872 under the name of the Eureka Silver M. and S. Co., has been bonded to O. Collier Robbins for $150,000. The property is located in the Buttercup range, west of Prospect mountain, near the Spring Valley road. Col. D. Manheim, who is a part owner, offered $35,000 for the claims at one time, but his proposition was declined. He, however, got a lease of the property from 1874 to 1879, in the name of his foreman, M. Mulligan, and took out about $60,000. There is a regular ledge, and the ore assays from $120 to $800. The product of the mine in the past has been worked at the Eureka Con. and Richmond furnaces. G. Collier Robbins, the bonder, was superintendent of the mine under the regime of the Buttercup Co., one of the first organizations in Eureka district. When the reorganization took place, under the title of the Eureka M. and S. Co., our fellow townsman, William Arrington, became superintendant. The latter company is still in existence. The mine is now being worked under lease with good results, ore being extracted daily and sent to our furnaces.

FLORENCE DISTRICT.

NEW DISTRICT.—Cor. Belmont *Courier*, Jan. 25: Florence mining district is about 8 miles north of Tybo. Almost daily reports reach us from there of strikes in the mines or new-discovered bonanzas being found. A few energetic prospectors have taken up a spoiled and abandoned district, and were from the first convinced that large wealth was hidden there, and if properly nursed and developed, the cast-away district would prove a bonanza, and so fully were they convinced of the fact that they set to work and organized a new district on Feb. 22, 1881; consequently the infant is not yet a year old, but in riches, as far as developed, proves to be a giant. The Sedan Co. worked faithfully in their mines, with what is termed miners' faith, and they now have enough good prospects to reward them for their labors. They have now a shaft down a little over 100 ft; the bottom of the shaft is completely in good pay ore, with the ledge on the surface 4 ft wide cropping out the entire length of the location and far beyond for a distance of 2 miles. Next is the Louisa. This ledge, too, is cropping out for nearly 2½ miles coming to the surface at the point of location to a hight of not less than 125 ft; this ledge is 10 ft wide at the foot of the high croppings. They have started a tunnel to run on and with the ledge; this tunnel will tap the ledge at least 600 ft deep; the tunnel has advanced about 20 ft, the face of it being now in rich ore. That same company will furnish you with rock, sufficient to run 10 or 20 stamps, of good grade ore, say $75 to $150 per ton, for a long time to come. And, as I said in the start, if Florence district was situated away about $5,000 miles or somewhere beyond the North Pole, people would break their necks to get there, but, unfortunately, it is right at home, and in Nye county, in the neighborhood of Hot creek.

LEWIS DISTRICT.

STARR GROVE.—*Herald*, Jan. 25: The main incline on the Starr-Grove mine has now reached a depth of 300 ft. The incline is being sunk under the ledge, as the country rock is much softer than the ledge. The ore house is nearly full of ore, and the Eagle mill will be started up on Starr-Grove as soon as the teams can haul ore enough to keep the mill running.

CHLORIDE.—The ledge was cut Saturday night in the main tunnel of the Chloride mine and is about four ft in width—broken up some, with good mineral throughout the ledge. The force of miners on this mine will be increased as soon as practicable.

EAGLE.—The ledge has improved considerable during the last week and has a much more solid appearance, with considerable mineral deposited through the quartz.

HIGHLAND CHIEF.—The main incline on the Highland Chief is down over 200 ft and being driven down as fast as three shifts can drive it.

MORNING STAR.—The Morning Star mine still holds its own. The levels are being driven ahead and the ledge looks as well as it ever did. Considerable ruby silver is being taken out.

BETTY O'NEAL.—Sinking on the new shaft has not been resumed, the force being employed in the stopes extracting ore. A new find has been made on the east side of the main winze which promises to open up a large body of rich ore.

PIOCHE DISTRICT.

SHUT DOWN.—The Bullionville smelter shut down last Wednesday, after a successful run of nearly 3 months. It shut down for want of concentrations, the amount on hand being exhausted. It will be ready to start inside of 6 weeks, as by that time the 14 tables that are now running will have concentrated enough of tailings to make another 3 month's run.

TEM PAHUTE DISTRICT.

PRESENT AND FUTURE PROSPECTS.—Eureka *Sentinel*, Jan. 28: Tem Pahute is of several years' standing, and comparatively little developed, owing to its great distance inland, but engineers have lately been surveying for a central road west in the vicinity of Silver Peak; thence to California, which, if completed, will make Tem Pahute grow, and render valuable the surrounding country. The line surveyed passes only a few miles south of Tem Pahuto mountain. Evidently a mineral belt stretches along the southwesterly slope of the mountains, the course of which is nearly due north and south, and bounded by a belt of slate on the east and quartzite on the west, ranging in width from 400 to 800 ft. The lode is mineralized lime, and carries high grade ore, of much the appearance of the Eberhardt ore of White Pine, which, after some assorting, pays about $300 per ton. This is shipped to Bullionville, a distance of 90 miles. Tem Pahute is pleasantly located, at quite an altitude, but so far south as to make the climate much more mild than it is at Eureka.

UNION DISTRICT.

STRIKE.—*Bonanza*, Jan. 28: Yesterday Mr. Murphy was clearing ground for an ore dump on the north side of the north shaft of the Centennial mine and exposed 10 ft of very fine ore. How much wider this new discovery will prove it is impossible to tell, suffice it to say that under the new management this mine is developing into one of the finest properties in Union mining district. The ore in the south shaft is improving in quantity and quality. A resident stockholder declared yesterday that he would not take less than $20 a share for his stock.

ARIZONA.

MEYERS DISTRICT.—Cor. Yuma *Free Press*, Jan. 28: The superintendent of the Montezuma Co. is expected to arrive every day, and start everything going in good order. It is understood that his company have $100,000 on deposit to be used in opening its mines in Meyers district. Mr. Dowling will also shortly commence operations on his property, with a large capital back of him. The working shaft on the Gunsight is being rapidly shoved ahead, and everything is moving like clock-work under the good management of Mr. Caldwell, who is a man of large mining experience, and one who understands his business. The machinery for hoisting works has arrived on the ground. All estimate that the big bonanza mine, the Gunsight, has $4,000,000 in sight, and, when opened up, will surpass anything in Tombstone, or indeed, in Arizona. A mine with 30 ft of ore in the bottom of the shaft cannot be a failure. Work on the Mineral Bed mine is progressing finely, about 20 men being at work in it.

TURKEY CREEK.—Arizona *Democrat*, Jan. 22: John Holmes has asserted the paying qualities of his Goodwin claim to such an extent that he has a force of men taking out ore. This property has paid from the grass roots. Mulvenon and Roach's claim on the Goodwin is looking finely. Fitzgerald and McAuliff's claim, the Big Chief, is down over 100 ft, and looks well at the bottom. The ore is argentiferous galena. The tunnel on the Quick Relief is in over 100 ft. The ore is carbonates. The shaft on the Lincoln claim is down about 50 ft with fine ore indications. One of the best indications of the camp is that those parties who went out last month to do assessment work are still at work. In most every case fine ore was struck which whetted their appetite. The Tuscumbia mill is a great help to Turkey Creek. The superintendent, Mr. Ed. Gobin, is very popular with his miners and chlorider, because he gives them the fairest kind of treatment at his mill. The Tuscumbia mill works up their ore to a high per cent., and gives satisfaction. Turkey Creek mining district is making a very fair showing at present.

WORONOGO (SAN DIEGO) M. CO.—The drifts on both levels are showing up fine looking carbonates. During the past week 9 ft has been added to the depth of the shaft.

TOMBSTONE.—*Epitaph*, Jan. 28: The past week has been a rather quiet one in mining matters, the capitalists and experts from abroad as well as home investors devoting their almost exclusive attention to the progress of the important mining suit which terminated last night.

COLORADO.

THE LEBANON TUNNEL.—Georgetown *Courier*, Jan. 28: Riley & Co., the contractors and lessees who drove the Lebanon tunnel to the Elijah Hisc lode, encountered what they think is the north wall of the lode, last week, and consequently stopped work at driving the tunnel ahead, and on Monday of this week started drifting on the lode both east and west of the tunnel.

THE MASCOTTE LODE.—The Mascotte lode, on Saxon mountain, is owned by H. C. Parker, who is driving an adit on it which has now reached a length of 555 ft and shows a vein of solid yellow copper ore from 1 to 5 inches thick that mills from 1½ to 5 ounces of gold and about 45 ounces of silver to the ton, and 18% copper.

THE LIBERTY.—Mr. H. C. Parker purchased last week from Geo. A. Mills, a one-half interest in this lode, and this week a contract and lease has been given to Peter Shively to sink a shaft at a point 150 ft from the mouth of the adit, to a depth of 100 ft, after which a drift will be run.

THE SUMMIT.—The tunnel which has been driven for this lode during the past fall and winter reached bedrock at a point 130 ft from its mouth, and is now being driven across the lode, which it has penetrated about 30 ft without reaching the north wall.

THE INDEPENDENCE.—A nice vein of ore was uncovered in the Littlefield shaft, on the Independence lode, East Argentine, the first of the week, which assays nearly 1,200 ounces silver to the ton. The vein is from 4 to 8 inches thick, composed of galena and black sulphurets, and was struck in a drift that has been started 40 ft from the surface.

IDAHO.

PLACERS.—Wood River *Miner*, Jan. 26: Four Eastern companies are operating placer claims on Snake river, near the ferry of the Kelton Stage Co.'s line. Some portions of the dirt or gravel taken out and shipped East panned out very rich.

MACHINERY.—We are creditably informed that the new machinery for the Mayflower, consisting of a complete outfit for first-class hoisting works is within 24 hours of Hailey as we go to press. The freighters who have the stuff aboard are under contract to push through to Bullion with all possible speed. As soon as the machinery arrives it will be set up and put in running order.

MONTANA.

THE MOULTON MILL.—*Inter-Mountain*, Jan. 28: From superintendent J. K. Clark it is learned that the west half of the battery in the Moulton mill was started into operation yester day, with very satisfactory results, and that the 40 stamps are now on good ore. The west Howell furnace was fired up at the same time, and is already doing excellent work. The mine, Mr. Clark states, is in splendid condition and is now producing daily from the stopes in the 200 and 300 levels 30 tons of ore, which amount can at any time be increased to 40 tons. The percentage of chlorination in the furnace which has been in operation since the mill was started varies from 90 to 96 6 10, which is exceedingly high considering the somewhat refractory nature of the ore. Preparations for the starting up of the mammoth Corulab pumping machinery are being actively made. The water columns are already in the shaft, the pump rods are in place, and all parts of the machinery having arrived, they now require only to be put together and set up. There is no lack of enterprise and energy on the part of the company, whose intention it is to push the thorough development of the property. To this end the company has already expended nearly $500,000.

MOULTON.—*Inter-Mountain*, Jan. 28: There was not a little excitement on the street last night caused by a report that 13 men working on the Cornish pump, in the Moulton hoisting works, refused to work longer without their regular monthly wages, which were due on the 20th inst. These men, it should be distinctly understood, were not in the employ of the Moulton Co., but were engaged by W. H. H. Bowers, the representative of the syndicate, to finish the construction contract. The employees of the company proper were paid off as usual last week, $24,000 being distributed. The mine is in splendid shape, and the 40 stamps of the mill are in constant and satisfactory operation. The financial standing of the Moulton is as solid as a mountain, and everybody who knows W. A. Clark, who now virtually controls the affairs of the company, knows that it is through no fault of his that the trouble has occurred. The matter rests solely between the contractors, represented by W. H. H. Bowers and the pump machinists, and has nothing whatever to do with the Moulton Co. proper. These statements will bear the fullest investigation and should be thoroughly understood before reports of any character are circulated in regard to the matter.

NEW MEXICO.

GOLDEN PROSPECTS.—*News and Press*, Jan. 28: Conductors Judd, Fuller, Bogue, Lyons and several others are interested with James Osfield, car recorder at Raton, in several prospects in the Cerrillos mining district. Among other claims they have about 20 acres of placer ground. About two pounds of gravel from the claim was washed out here this week, which showed the ground to be very rich. Over a thousand colors were obtained by panning, and particles of gold were plainly detected with the naked eye. It is estimated that the two pounds of dirt yielded 25 cents' worth of the yellow stuff, and the dirt is said to be an average of the claim. What is of more importance than rich gravel is the nearness of this claim to water. One of the owners of it is also interested in the Tennessee mine, only 300 ft away, in which there is a good stream of water, and through his influence this water can be piped to the claim for washing gold.

OREGON.

NOT FAVORABLE.—Jacksonville *Times*, Jan. 27: Many of the miners have been able to do some work since the thaw and rain of this week, though a few of the nights have been cold and were accompanied by frost that served to make water scarce again the fore part of the day. Altogether, the mining season has not been a favorable one thus far, though it is not too late yet for a great change for the better. More rain is wanted. Hannum & Roff of Grave creek, made a good run before the thaw, and are busy again since. Some of the miners have plenty of water again and are at work, but others are not so fortunate. B. Corder, of Grave creek, has found some rich quartz croppings and is looking for the main ledge. Hale & Manning, of Leland precinct, have their ditch completed and will commence active operations at once. Gin Lin attempted to force the water through his ditch (which was filled with ice) damaging it considerably. The Sterling Co.'s ditch has been full of ice and Supt. Ennis has not attempted to run the water into it as yet. There seems to be more snow than ever on the hills and mountains, which will prolong the season to some extent. L. Orme, of Foots creek was in town last week. He informs us that his brother, Alex., is now prospecting for copper in Smith river valley. Bybee & Fisher's ditch to the big bar of Rogue river has been completed and work on the bar will be commenced as soon as the weather moderates. Andrew McGee and Sheppard Bros. are engaged in mining a short distance from Major Barron's place, with flattering results. They cleaned up over $17 worth of beautiful gold after a run of about 2 days. G. K. Justus and wife, of Foots creek, were in town this week. George, who is now engaged in mining, says that most of the miners of that camp are busy since the late thaw and that there will be unusual activity there in case of plenty of water, as several miners have fitted up their claims in a better and on a more extensive scale than ever.

UTAH.

MILFORD.—Cor. Salt Lake *Tribune*, Jan. 28: Milford has a 1 stack complete galena furnace in good order. Also a 10-stamp silver mill in good condition, and as soon as it is demonstrated that 20-oz silver ores can be worked to a profit, this or some other mill will be run successfully, for a large quantity of quartz containing from 20 to 35 ozs silver per ton has been developed in Star district, and by a fair estimate there now lies over 10,000 tons of such kinds of ores upon the different dumps.

STAR DISTRICT.—The Mammoth mine in this district is owned and worked by Matthew Cullen and others. A tunnel is being driven in from Maring's canyon which will strike the ore body at a great depth. The Boston, owned by W. S. Searls, has within the past year been surveyed and patent has been granted. Considerable work has been performed upon the same and a good showing is now had of ores. The Burning Moscow now presents an immense body of low-grade ore that will one day be perfected and successfully worked. The Rebel mine has a perpendicular shaft 200 ft down, and a drift run during the past year. It has a good showing and has produced in times gone by $120,000 in ore. The Hickory is one of the first patented mines in Star district, and was once sold for $80,000, and a 10-stamp mill built at Milford, which cost $40,000. But the ores, after awhile, proved to be smelting instead of milling. The mill has shut down. The Cortez and Esmeralda mines, owned by C. C. Woodhouse of Beaver City, have just been patented, and are true fissure veins of the same character as the Tribune, and are situated west and on the same belt. The Chief of the Hill has just been sold, the parties buying being old miners of Star district who see in it something on which to stake their last dollar.

Recent Contributions to the California State Mining Bureau.

[Furnished by HENRY G. HANKS, State Mineralogist.]

[CATALOGUE.]

Tetradnum, Lower Silurian Fossil—Watertown, N. Y.

Limonite—Gold Lake, Sierra county, Cal. M. Lauer.

Molybdenite—Occurs with quartz in gold mines, Santa Fe, New Mexico. Geo. W. Utter.

Gold Nugget—Near Placerville, El Dorado county. Purchase.

Magnetite—Base of Mt. Hoffman, south side of the dividing ridge between Mariposa and Tuolumne counties. J. S. Shilling.

Magnetite in Gangue (Epidote?)—Base of Mt. Hoffman. J. S. Shilling.

Fifty Samples of Japanese Woods—Purchase.

Half an Ounce of Placer Gold—Jenny Lind, Calaveras county, Cal. Purchase.

Stalactites—Calaveras cave, Cave City, Calaveras county, Cal. Geo. Nichols.

Copper Sword—Found on Chenook beach, opposite Astoria. William E. Dement; brought down from Astoria by Charles A. Hughes.

Ammonite—Gus Point, Shasta county, Cal. J. W. Garden.

Stalagmite—Cave City, Calaveras county, Cal. George Nichols.

Gold Quartz Showing Free Gold—Newly discovered mine near Cave City, Calaveras county, Cal. Joseph Metich.

Building Stone—Mr. Wheat's house, Double Springs, Calaveras county, Cal.

Slate—Which crops out over a large extent of country between San Andreas and Cave City, Calaveras county, strike nearly WNW., dip nearly vertical.

Diorite, with Section—Cut by Frank Attwood. Croppings near Cave City, Calaveras county, Cal.

Chalcopyrite—Campo Seco, Calaveras county, Cal. Taken from a large quantity at Milton awaiting shipment.

Trachytic Lava (?)—Which caps isolated hills between Milton and San Andreas, Calaveras county, Cal.

Convoluted Root—Sluiced from a mining claim at Butte City, Amador county, Cal. Matthew Ryan.

Sphere of Rock Crystal, Quartz, with included Crystals of Rutile—Japan. Purchase.

Photograph of a Flowing Artesian Well—At Battle Mountain, Lander county, Nev., one mile from the town. It yields 2,000 gallons of water per hour. The well is 165 ft. deep. Fifty acres of grass, 25 acres of grain and vegetables are irrigated by it; and 150 acres of desert land are so far reclaimed by it as to be fit for pasturage. The well was sunk by J. A. Blossom, of Battle Mountain. Photograph donated by the *Daily Report*.

Quartz with Remarkable Impressions of Crystals, of a Mineral probably Orthoclase.—This rare specimen should be carefully studied. From Volcano, Amador county, Cal. J. W. Collins.

Clay—Bodie, Mono county, Cal. J. P. Manrow.

Limonite—Idaho. Robert Gardiner.

Carbonate of Magnesia, with Silica—Under the microscope, cryptocrystalline. Aroyo Seco, Monterey county, Cal. Occurs in a vein 2 ft. wide. W. T. Armstrong.

Rutile—Graves' Mountain, Lincoln county, Georgia. Exchange.

Turgite and Limonite—Salisbury, Canada. Exchange.

Thompsonite—Grand Naurais, Minnesota. Exchance.

Mesolite—Near Belfast, Ireland. Exchange.

Pelhamite—Pelham, Mass. Exchange.

Apatite in Calcite—Grattau, Canada Exchange.

Apatite—Templeton, Ontario county, Canada. Exchange.

Apatite—Grattan, Canada. Exchange.

Apatite—Krageroe, Norway. Exchange.

Apatite with Red Calcite—Grattan, Canada. Exchange.

Bronzite, Asbestiform—Pelham, Mass. Exchange.

Pyrophyllite—Graves' Mountain, Georgia. Exchange.

Phosphorite—Logrosan, Spain. Exchange.

Chrysocolla—Templeton, Ontario county, Canada. Exchange.

Tremolite in Dolomite—Lee, Mass. Exchange

Menilite—Variety of opal. Coosaw, South Carolina. Exchange.

Anorthite—Pelham, Mass. Exchange.

Keatingite—Franklin, New Jersey. Exchange.

Fossil Wood—Coosaw, South Carolina. Exchange.

Kaolinite—Richmond county, Georgia. Exchange.

Chlorophane—Trumbull, Conn. Exchange.

Zircon—Henderson, North Carolina. Exchange.

Dewcylite—Templeton, Ottawa county, Canada. Exchange.

Staurolite Crystals—Morgantown, Fannin county, Georgia.

Augite—Templeton, Ottawa county, Canada. Exchange.

Titanite-Ledererite—Grattan, Ontario county, Canada. Exchange.

Augite Crystal—Jefferson county, New York. Exchange.

Danburite—Rossie, Lawrence county, N. Y. Exchange.

Margarite—Trumbull, Ottawa county, Canada. Exchange.

Emery and Margarite—Chester, Penn. Exchange.

Cookeite, Cleavelandite and Tourmaline—Chesterfield, Mass. Exchange.

White Scapolite and Actinolite—Jefferson county, New York. Exchange.

Ledererite, with Black Augite—Grattan, Ontario county, Canada. Exchange.

Chromiferous Augite—Wakefield, Ottawa county, Canada. Exchange.

Knebelite—Cumberland, Rhode Island.

Phlogopite—Burgess, Canada. Exchange.

Kyanite—Graves' Mountain, Georgia. Exchange.

Greenish White Granular Apatite—Templeton, Ottawa county, Canada. Exchange.

Pagodite—Washington, Georgia. Exchange.

Idocrase—Templeton, Ottawa county, Canada. Exchange.

Lazulite—Graves' Mountain, Georgia. Exchange.

Wilsonite—Templeton, Ottawa county, Canada. Exchange.

To JOIN sheet rubber, prepare a cement as follows: Digest in a wide-mouthed stoppered bottle a quantity of purified gum rubber (caoutchouc) cut into fine shreds, with just enough bisulphide of carbon to thoroughly soften and convert the gum into a uniform thick paste, assisting the action of the solvent by frequently shaking the bottle. Moisten the edges of the sheets to be joined with a mixture of one part chloride of sulphur and 20 parts bisulphide of carbon, well shaken together; then spread on the cement, bring the parts together, and put under strong pressure for 12 hours in a room heated to about 80° Fahr. The cement should not be used or kept in the vicinity of fire.

Awards to Workmen for Inventions.

The scheme of awards for inventions, instituted in August, 1880, by Messrs. Wm. Denny & Bros., shipbuilders, Dumbarton, and which has been regarded with considerable interest by very many employers of skilled labor, has just been amended and re-issued to the workmen in their establishment. The results of the scheme, as regards the number of workmen making applications or claims for inventions or improvements, have been thoroughly satisfactory. The number of claims found valid, and the important nature of some of the inventions or improvements for which awards have been granted, have been such as to encourage Messrs. Denny to amend their scheme in one or two particulars, whereby it may be rendered more effective. The maximum limit of award as laid down in the original scheme, was £10; but it has been thought that the smallness of the sum may deter some from coming forward with ideas, or with matured inventions of greater technical importance or value than have yet been elicited. Accordingly, Messrs. Denny and the committee of awards acting between employers and employed in this matter have made a revised scheme wherein the fixed maximum limit of award is supplemented or superseded by the inducement of either (1) the granting of a greater award than £10, or, if considered worthy (2) the award of £10, together with material assistance in securing letters patent for the invention. The following are the principal rules or features of Messrs. Denny's first scheme: 1. Any workman in our employ may claim an award from the committee on the following grounds:—(a) That he has either invented or introduced a new machine or hand-tool into the yard. (b) That he has improved any existing machine or hand-tool. (c) That he has applied any existing machine or hand-tool to a new class of work. (d) That he has discovered or introduced any new method of carrying on or arranging work. (e) Or, generally, that he has made any change by which the work of the yard is rendered either superior in quality or more economical in cost. 2. In the case of a workman who is unable to test the merits of his supposed invention or improvement, either through inability on his own part to make the necessary experiments or to pay for the same, the firm, on the recommendation of the committee may agree to bear the whole, or part, of the necessary expense; and if the invention should afterwards prove a practical success, an award will be granted accordingly. 3. On the establishment of a claim under the conditions above specified, the committee are to make an award, which is not to fall below two pounds, nor to exceed ten pounds. Between these limits the award will be fixed by the committee according to the opinion they may form of the value of the improvement or invention for which claim has been made.

The clauses in Messrs. Denny's second scheme, embodying the changes in question, are as follows: 2. In the case of a workman who is unable to test the merits of his supposed invention or improvement, either through inability on his own part to make the necessary experiments or to pay for the same, the firm, on the recommendation of the committee, may agree to bear the whole, or part, of the necessary expense; or the committee will be at liberty to grant the free use of tools and appliances in the yard for this purpose, and if the invention should afterwards prove a practical success, an award will be granted. 3. On the establishment of a claim under the conditions above specified, the committee are to make an award, which is not to fall below £2, nor to exceed £10. Between these limits the award will be fixed by the committee according to the opinion they may form of the value of the improvement or invention for which claim has been made. But in the case of an invention or improvement being considered by the committee worthy of a greater reward than £10, they shall submit a report on the same to the firm, who may sanction either (1) the granting of such greater award than £10; or (2) should the invention be considered worthy of being protected by patent, an award of £10, together with the taking out at the firm's expense of provisional protection at the Patent Office on behalf of the inventor, all with a view to enable him either to dispose of his invention during the period of protection, or to make arrangements for completing the patent at his own or his friends' expense, provided always, that the firm shall have for all time coming the use of any such invention so provisionally protected at their expense, free from the payment of any royalty or patent rights that may be chargeable on the same, should the patent be completed.

Messrs. Denny & Co., Engineers, Dumbarton, have also, but for the first time, made offer of awards for invention to their workmen, and the scheme is in all respects similar to that just issued to Messrs. W. Denny & Brothers' workmen. The results of this renewed effort on the part of Messrs. Denny to quicken the inventive faculties, and increase the technical proficiency of their workmen are sure to be waited on with interest. It is to be hoped such measures may be productive of the good, which, in some quarters, is only hoped for through the increased institution of technical schools; and that the advantages accruing to the business of the firms in which the system has been introduced may speedily be such as to lead to its adoption in other places.—*Iron.*

Tail-Rope under Hoisting-Cages.

Mr. William Dean writes the following suggestive letter to the *Colliery Guardian:* The line of argument adopted by advocates of tail-ropes is, or need only be, one of figures. I will at once presume we have a pit 600 yards deep, with flat drums, and round ropes 3½ inches circumference, and 13 lbs. per fathom (equal to 3,900 lbs.), and raising at one winding two tons of fuel. Without the tail-rope, we have to overcome a dead-weight at commencement of 3,900 lbs. of rope; and 4480 lbs. of fuel, or 8380 lbs total, plus the friction and strain power, must be supplied to meet this. Now suppose we attach a tail-rope to these cages, what is the result? The resistance to be overcome in the former case was 8,380 lbs., plus the friction; but now we have under the cages a tail-rope, equal in size and weight to the winding rops in shaft, or 3,900 lbs. less dead-weight to lift, so that we have to lift, not 8,380 lbs., plus friction, but 8,380 less 3,900 lbs., giving 4,480 lbs., plus the friction, or simply fuel and friction, and this decrease in dead-weight will give a very considerable reduction in piston pressure necessary for ordinary winding. I have often wondered why colliery proprietors do not, when practicable, apply the tail-rope, and can find no other excuse worthy the name than simplicity. Probably it may be owing to its simplicity that the tail-rope does not so rapidly as could be wished gain in the good opinion of the colliery proprietors. Still I fear some people hesitate to use the tail-rope, thinking it is part of the "Koepe" patent, and cannot consequently without danger be applied. This is not so. The tail-rope is applied to some collieries, and I believe with every satisfaction. I am told at one colliery—a shallow one—where it is working they "effect a saving of five pounds per square inch boiler power," and at another colliery they "save one sixth in fuel." Other instances could be quoted if it were necessary. The tail-rope may be an old rope from off the pit in which it is to work, and will last as long as it can safely carry its own weight, it having no other work to do. The adoption of tail-ropes effects the very desirable result of reducing to a minimum the oscillation of the cages, seeing it acts the part of an additional conductor, and in addition enables the engineer to get up to full speed in a very short time, and at a much less expenditure of fuel. The only things necessary to apply the tail-ropes are an old rope and a dip-hole, and, where flat drums are in use, a moderately shallow dip-hole will suffice; but with vertical or conical drums, provision has to be made, by having a deeper dip-hole, for the increase in velocity of the descending cage, until the "meeting" is reached, when the rope which has accumulated will with equal speed be taken up again. The deeper the pit, the greater the advantage in the tail-rope, and with flat ropes a great saving is effected. The application need not cost more than a mere trifle; no difficulty is experienced at point of return in sump with the rope, and a pulley in sump is unnecessary.

Reckoning Quantity of Coal in Place.

A summary way of reckoning the quantity of available coal in a given area of a seam is to take an acre of coal one inch thick to contain 100 tons; this leaves a sufficient margin for faults and loss in working.

Example: A seam of coal 24 inches thick will yield 2,400 tons per acre. But to ascertain the exact quantity of coal under a given area—presuming the seam to be lying of regular thickness and quality throughout—the first thing necessary is to obtain the specific gravity; then, as this represents the weight of a cubic foot in ounces, it is a simple matter of calculation to obtain the gross weight.

The exact weight of coal seams can be got from the table below:

Specific gravity.	Weight in the natural bed, per acre, per inch thick, in tons.	Weight of a cubic foot in the broken state, in lbs. Large coal.	Small coal.
1.10	111.411	42.62	37.12
1.15	116.475	44.56	38.81
1.20	121.540	46.50	40.50
1.25	126.604	48.43	42.18
1.30	131.668	50.37	43.87
1.35	136.732	52.31	45.56
1.40	141.796	54.25	47.25
1.45	146.860	56.18	48.93
1.50	151.925	58.12	50.62

If the figures in the second column be multiplied by the number of inches any coal seam is in thickness, the result will be the contents in tons per acre.

The weight of coal in its broken state, that is, as it comes to the surface in tubs or otherwise, will depend on its mechanical structure; it has here been computed to weigh in proportion to the solid coal as 62 is to 100, and the weight of the small as 54 is to 100.

PROF. BLYTH, in his lectures at Anderson's College, Glasgow, strongly solicits attention to the very beautiful method of lighting by oxyhydrogen gas. He states that he sees no difficulty in obtaining by many sources of power these gases, separately or combined, storing them as cold gas is stored, and distributing them in the same manner. His rough calculations led the professor to believe that by using wind or water power to produce the gases their use would be economical.

THE San Francisco company's copper mine at Spenceville, in this county, says the Nevada *Daily Transcript*, continues to prosper under Mr. Ellis' superintendence. Last month 38 tons of cement was produced. Copper has recently taken a jump in price, and the mine is now being worked cheaper than ever before.

Hydraulic Pumping Machinery.

The success of the hydraulic pump at the Chollar-Norcross-Savage shaft bids fair to make an epoch in mining on the Comstock. It will, in all probability, revolutionize the methods of draining the lower levels.

The fact that the hydraulic pump was made to operate with the assistance of an engine on the surface, was in itself a great victory for those who had the work in hand, but the operating of the pump by the natural pressure of water brought from a receiving tank placed on the side of Mt. Davidson, is an achievement of still greater importance.

This is the key which is to unlock the treasure house of the Comstock. In other words, it is by this means that the draining of deep mines is made not only practicable, but comparatively inexpensive. Given a cheap and reliable method of handling the water of the mines, and the work of prospecting for bonanzas may be carried on at the pleasure of the managers of the property.

There are reasons for believing that a system of hydraulic pumping similar to that in operation at the Chollar-Norcross-Savage shaft will ultimately be adopted at all of the principal shafts on the lode.

The primary and most important consideration in favor of the new system is that of economy. The first cost of the hydraulic machinery may be as great or even greater than that of the steam-rigged apparatus, but the saving in running expenses is necessarily immense. The cost of wood for the engines of the usual machinery is one of the largest in the current expense of the mine. By the adoption of the hydraulic system the greater part of this may be saved.

The men who manage the most prominent north-end mines are also credited with holding the control of the Virginia and Gold Hill Water Co. This being the case, they have in their own hands a power for operating their machinery which is available, cheap and practically inexhaustible.

There is another advantage in the hydraulic system which is not to be disregarded. It is that of convenience. The usual ponderous pump-rod is dispensed with, and in its place are two stationary pipes, that take up but little room, are not liable to mishaps, and that by virtue of their being immovable, will not endanger the lives of the men who are compelled to work in the shaft near them.

It is known that a great deal of the timber land owned by the managers of the north-end mines has been stripped of its wood, and that the supply is becoming meager. This being the case, a substitute for furnishing motive power must be found, and there can be but little doubt that it will be sought in the application of hydraulics. It may be suggested that the present supply of water would not be sufficient for all the pumps, say they were put in at the Union shaft, the Best & Belcher and Gould & Curry shaft, the Chollar-Norcross-Savage shaft (now in), the Yellow Jacket shaft, and possibly the Forman shaft. In that event it would well repay the companies to bring in another ditch. As before remarked, the wood supply is showing signs of weakening, while the supply of water in the mountain lakes is inexhaustible. When once set to running there is no cost of transportation on it, while with the wood for the engines now in use, the freight is a very great item.

The time for this revolution in pumping machinery may not be as near at hand as indicated above, but that there are reasons for believing that it will come about sooner or later, must be apparent to everyone who will give the subject careful consideration.—*Gold Hill News.*

A New Arizona District.

The Tombstone *Epitaph* says: There have been startling reports upon the streets for the last week in relation to a new discovery in this county, that if one-half is true that is reported, bids fair not only to rival, but to eclipse, the great wealth of the mines of Tombstone. From Mr. A. J. Mitchell, who has just returned from this new Golconda, the following facts have been learned.

Upon discovery of the mines, the prospectors held a meeting and laid out a new district bounded as follows: Commencing at a point on the road from Point of Mountains to Tres Alamos due south of the Pilot Knob, and running thence along said road to Point of Mountains, thence north 10 miles, thence west 10 miles, thence south to the Tres Alamos road, and thence easterly along said road to place of beginning. The mines are situated about five miles west from Point of Mountains, 12 miles west from Willcox, and 18 north of Summit Station on the Southern Pacific railroad.

The Mines.

There are at present about 50 locations in the district, many of which show high grade ore on the surface. The principal and central mines are the Grand View and Antelope, both located upon the same ledge. The outcrop is said to be immense, standing in places from 10 to 15 ft. high, being traceable for 3,000 ft. The assays from the croppings run from $50 to $1,400 per ton. The ledge has been cut through in two places, and the ore was found so rich that it was piled upon canvas and old flour sacks to save the horn silver and chlorides, with which it is completely impregnated. Four assays from these places gave $300, $600, $1,200 and $1,400 respectively. The ore occurs between lime upon the south and quartzite upon the north.

The Engineer.

American Railroad Progress.

Herapath's London *Railway Journal* of a late day, in speaking of the wonderful progress which this country has made in railroad building, says: The figures are startling, but when it is considered what railways are in that country, the alarm will cease. "A railroad there is made instead of a common road, and is very little better than—in some cases not so good—as a tramway. The outside estimate of cost for the 16,000 miles of new railroad is only £5,000 per mile. This would require a capital of £80,000,000. A country that could spend hundreds of millions of pounds per annum in war, and afterwards not only pay the full interests on the accumulated mass of debt, but pay off the principal at what everyone admits to be a wonderful rate, which has already broken the back of that truly ponderous debt, which now enjoys the highest credit, ought not to bend beneath the weight of an undertaking for railways, such as that to which we have referred—£80,000,000 to be expended in 15 months.

Millions spent in war are absolutely lost. They buy nothing. It may be said indeed that they buy less than nothing. They purchase destruction. There is not only the enormous expense alluded to, but there is also the loss of hundreds of thousands of able bodied men, and the waste of material. But when 16,000 miles of additional railway are constructed they immediately do useful work and earn a profit.

America without her railways would be a barren land. Canals can never be there more than partially useful. The frosts are so severe that for a large part of the year a canal is a solid instead of a liquid, and even during the hot months that mode of conveyance is open to the objection that it is not only slow but vapory. Just when the means of conveyance is wanted frost sets in, and destroys the utility of the canal, while the railway is open all the year round.

Already the railway has beaten the canal in America, as elsewhere, and yet it is the canal that is to set aside the railway! No, not exactly the canal, but certain rivers in conjunction with various lakes. But these are all water ways, and open to much of the objection found to apply to that mode of communication; and the connections to be formed are canals. In our belief water, in a country both bitterly cold and intensely hot, can never successfully compete against railways as an all-year-round working machine. Poor's last work points out how the canals in America have shrunk in their business before the operation of the railways, and concludes: "We must have railroads. The 100,000 of to-day will in 10 years by 200,000." There is no doubt that railroad making must proceed apace in America if the country is to progress, and as in the course of the last 100 years the population of the United States has enlarged from 4,000,000 to 50,000,000, and yet the country is sparsely populated, having regard to its enormous dimensions, it is evident that the vast length of line may be doubled without the work being overdone.

The more railways that are made in America the better for the existing lines, except perhaps in those cases where there is direct competition. The large railway systems, however, can only sustain partial competition, and that for through traffic, which is the least remunerative portion of the whole traffic, and which under a war of rates may be absolutely unremunerative (as was the case this year). The local traffic of America is assuming large proportions.

New lines feed old lines, and the more complete a railway system becomes the greater is the growth of traffic.

It may be added that the more rapidly railways are made in America the quicker will be its development in material prosperity, and the better it will be for English manufacturers, for the greater the demand the more certain it is that English goods will be bought. It is simply impossible that the American can make all the iron, steel, etc., that they will require, that is to say, should 16,000 miles of line be constructed in the next 15 months.

Shortening the Voyage Across the Atlantic.

There appears to be no cessation in the efforts to shorten the time between America and Europe. The Atlantic is now traversed by the largest and fastest steamers in the world, and yet shipbuilders are not satisfied.

The latest effort in this direction is by a Swedish engineer, Capt. Lundborg. He proposes to build a steamer about equal in size and power to the *City of Rome*. The peculiar feature of construction is to so build his ship that the main body shall divide the water horizontally instead of vertically. The hull, therefore, projects forward below the water line, and this peculiarity of his design enables him to have large engine room, to get great capacity with shallow draught, and to give his vessel favorable lines. The purpose is to reduce her resistance to a minimum. The power used, 22,800 horse-power, would give the ship, according to the ordinary formula used for calculating speed, something over twenty knots. It is supposed, however, that she would be faster, since little power would be lost in wave-making, the water having a clean run astern, being divided horizontally by the projecting lower part of her hull.

Naval architects are not apt to look with favor on any marked departure from the ordinary principles of ship construction, and therefore Capt. Lundborg's proposed vessel is likely to find adverse critics among them. The London *Engineer*, however, speaks with respect of his ideas, and urges that they be put to a practical test in a steamer of moderate size. Even if his ship is not feasible, however, steam vessels constructed after the received plans are likely before long to make the voyage across the Atlantic in the time set by him.

Useful Information.

Paint Removing.

A preparation, of which potash and soda are the principal ingredients, has just been introduced into England, and is said to be a perfect paint remover. Some experiments made with the preparation upon various specimens of painted wood and metal, all old samples, well painted with several coats of good oil color, were very successful. The compound, which is of a cream-like consistence, quite white, is spread over the painted surface, and after being left on a few minutes, is wiped off. Its action upon the body of the paint is thorough and complete; a saponification is set up which continues; the soda is liberated, and fresh soap formed, and this process goes on, the alkali being liberated as it is wanted, till the whole of the paint is removed. Painted surfaces, in about a quarter of an hour, show every trace of paint cleanly removed, and the wood exposed as if it had been planed.

The action of this preparation seems to be twofold. There is first the destructive action of the applied alkali, always caustic, and next, a continued sponge-like action going on—in other words, a constant and perfect causticity is maintained. The result of the preparation on metal is equally convincing. A gas meter, if exposed to the compound for about 20 minutes, has the Japan removed and the bright metal exposed. Other forms of the preparation are of a weaker character, and nearer to soap in their composition. They are intended to remove dirt, and their action is just the reverse of the compound already described. The preparations are liquid, and are soluble in water, and their cleansing power upon cloth of an unmistakably greasy and dirty character is said to be almost magical. For delicate carvings and fabrics of all kinds, these solutions are adapted, and their use by restorers, decorators and others, will be highly esteemed. The modification of the solution for cleaning cloth is well adapted for restoring the linings of railway carriages, and stuff seats of all descriptions. No scraping or erasing is necessary.

There is nothing injurious, it is said, in the preparation which can attack or injure metals or clothes. They all produce a minimum action on brushes, which is a consideration; and, what is very important, color is not taken out by the use of the solutions. The price is less than that of other preparations. The "paint remover" can be easily applied by being spread over the painted surface to be removed. It is sold in 5-lb. tins, at 2s. 6d. each.—*Oil and Drug News.*

White Slates.

A German, named Schmidt, has patented a school slate, which consists essentially of a stiff piece of white cardboard, covered with artificial or paper parchment, prepared by the action of sulphuric acid upon unsized paper.

They are set in the ordinary wooden frame, and furnish a cheap and indestructible slate. The ordinary size sells for 30 pfennigs (7½ cents). He also makes a peculiar kind of ink for use with these slates, called "children's ink" *(Kindertinte)*. It is made of harmless mineral colors and a solution of dextrine, and has an advantage over common ink, that the blots, which children are sure to make, can be easily washed out with cold water. The same slate can also be used to write on with ordinary ink or lead pencil, and both washed off with a moistened sponge. When the slates are intended for use with lead pencils, they are coated with water glass, which permits of writing upon the slate immediately after washing and while still wet. If in the course of time the water glass film gets dirty, it can be removed with a piece of sandpaper, and a new coating applied with a sponge. The tablet itself shows through the parchment and water glass film perfectly mat white, which permits of its being used in any light, and is especially advantageous for drawing, because the shading of drawing is black, and that is more natural than to make white shading with white chalk. Colored pencils or crayons can also be used, and is useful in teaching natural history.

For discoloring gum arabic, the solution, after being filtered through calico, is mixed with freshly precipitated hydrate of alumina in the wet state, and then filtered through a linen cloth, when a colorless gum solution will result. By filtering the gum solution through a layer of freshly precipitated alumina it can be also discolored greatly, and by repeating the filtration several times a quite colorless liquid is obtained.

Making Hollow Rubber Balls.

The process of making hollow rubber balls, used by children as playthings, is quite curious and may be interesting to those not familiar with it. These balls have a solid surface and are made by a different process from the soft rubber balls (which are perforated by an opening) and are much more firm, durable and elastic. The sheets of rubber prepared for balls are cut into strips of double convex shape. The edges of the strips are moistened with a preparation of rubber and naphtha, by which they are joined firmly together, three of the strips being used for one ball.

This part of the work is done by girls, and a skillful girl can earn about $1.50 per day. When the strips are joined together, the ball is very near the shape of a Brazil nut. Before the last opening is closed, a quantity of carbonate of ammonia is put inside, which, when subjected to strong heat, will make the rubber expand and fill out the ball mold. The opening is then closed with the adhesive mixture, and it is placed in an iron mold of the size and shape of the ball desired. The molds are packed into frames in which they are subjected to the heat of a vulcanizer.

They are kept in place in the frame by iron rods along the side, and when the frame is full, iron plates at the end are screwed down tightly upon the molds to keep them in place. These iron plates are about three-fourths of an inch thick, and so strong is the expansive force of the rubber in the molds that they bend this thick iron rod into a curve. If one of the molds should work out of place while vulcanizing is in progress, the molds would fly out with a noise like the report of a dozen pistols, and the work is spoiled. The action of the heat does the rest. When the molds are opened they contain the perfect round balls with no mark of the places where the pieces were placed. The slight ridge made by the mold is ground off by a stone, and the ball is done.

Oil on a Carpet.—You can get a bottle or barrel of oil off any carpet or woolen stuff by applying dry buckwheat plentifully and faithfully. Never put water to such a grease spot, or liquid of any kind.

Good Health.

A Plague of Worms.

The workmen employed in the St. Gothard tunnel have all suffered from a painful disease not due in any way to the nature and conditions of their labors. In a memoir just published, Dr. Bugnion traces the disease to the presence of the parasitic worms in the intestines of the subjects of the malady. This nematoid worm (*Ankylostoma duodenalis*) was first discovered in Milan, in 1838; it has been met with in various parts of Italy; is extremely abundant in Egypt, and it has also been found in Abyssinia, India, the Sunda Isles, Riode Janeiro, Cayenne, and the Antilles. In the intestines of the first tunnel workmen who died of the disease (at Turin hospital), more than 1,500 individual worms were counted. Many workmen have been severely afflicted, but the extent to which health must be compromised is strikingly indicated by the fact, stated by M. Bozzolo, that he found eggs of *Ankylostoma* in the stools of all workmen he examined without exception. The creature has prodigious fecundity. Happily the eggs are not developed in the person who harbors them; the development begins in the excrement or the moist earth, and gains admission to the intestines with unwholesome water.

Large numbers of laborers from the regions which furnished the workmen of St. Gothard have been brought to this country to engage in railway construction and similar rude employments. They bring their careless and uncleanly habits; and there is danger of their defiling springs and water courses where they are camped, and so spreading the worm pest along the lines of new railways.

Pasteur's Discoveries.

The researches of Pasteur among the lower forms of life, especially those associated with certain malignant diseases, have given results which are, perhaps, more pregnant of benefits to come to humanity than any other work of the century.

That scientist, having discovered that an infant's saliva contains septic germs and is poisonous when inoculated into the skin, is now reported to have made a similar discovery in regard to the saliva of *fasting* adults. It is only when fasting that the parasites are found in the saliva. They are swallowed with the food and do no harm in the stomach. If, by cultivating the specific virus of our more malignant diseases, the morbific elements may be deprived of their malignant character and yet remain capable, when inoculated, of making the organism as proof against the true disease, as a real attack of it would, preventive medicine has entered upon a stage of infinite importance to mankind. So far, the tests seem to justify the most hopeful anticipations.

Still, says a contemporary, that eminent microscopist will scarcely receive the thanks of the community for telling us that our mouth is full of venom before dinner. Can he not turn his explorations in some other direction?

Digestability of Bread.

The readiness of assimilation in digesting bread depends on its greater or lesser porosity, which is also dependent on the nature of the bread stuffs employed and the treatment of the dough. The less gluten the flour contains, the more compact will be the baked loaf, and the more gluten it has the more porous it will become. The cereal flour containing the most gluten is wheat flour; rye flour has less. The starchy component of the kernels of cereals are principally all nutritious matter, being no chemical combination with nitrogen. The starchy matter is changed during the process of baking into starch-paste, and is thereby made more easily digestible. The crust is still easier to digest, as it is the starch-paste converted into dextrine and sugar. It is, perhaps, advisable to have a little bran in the dough, or to have the kernels ground coarsely, producing Graham flour, for the branny particles, intermixed with the nutritious matter, mechanically irritates the inside lining of the stomach, inciting the peptine glands to discharge more of their digestive fluid.

As the nerves of the stomach lining of older persons are rather weakened, this mechanical irritation is decidedly to be preferred to the imitation induced by stimulant drinks or aromatic, spicy substances, which only produce a momentary increase of the discharge of the peptine fluid, while the branny particles of Graham bread act continuously and energetically. Bread must always be well salted, as it contains considerable quantities of alkali salts which would withdraw a great portion of salt from the system by making chemical combinations therewith.

Next to porosity of bread, its contents of water influence its digestability. Dry, old bread is easier to digest, as it must be chewed more than fresh bread; hence it will be better masticated, and the stomach will have less work. It is supposed to be known that mastication is part of digestion, saliva being as well an assimilator as the fluid of the peptine glands of the stomach.

There is but little fat in the bread baked of cereal flour. Wheat contains 1.2% rye, 1.6% of fatty substance. Corn contains very much of it, 4.6%, this being the reason why corn bread is so recommendable for hard-working men.

For men of sedentery habits, corn bread would be hard to digest; wheat bread is better adapted to their requirements. The human body needs the daily supply of fatty substence which can be easily assimilated; thus, the mixing of the dough with milk is very good, the digestion of such bread being rapid and easy.—*United States Miller.*

The Salicylic Treatment of Rheumatism. Dr. Maclagan, of England, who introduced the salicylic treatment of rheumatism, has recently published a work defending the treatment and insisting on its advantages over every other method. Of the 30 salicylic compounds, but two besides salicine itself are employed—salicylic acid and salicylate of soda. After ample trial carried through several years of practice, he concludes, that in rheumatism, 30 grains of salicine should be given every hour, until pain abates, and then every two hours during the day for a few days, and afterwards gradually withdrawn. He insists on the large doses as necessary to develop the full benefits of the medicine. Much complaint has been made in various quarters of the failure of the salicylic treatment, and it is quite probable that this has resulted from insufficient doses. We ourselves have generally been content with 15 or 20-grain doses every two hours in the form of salylate of soda, from which good results follow in the large proportion of cases.—*Pacific Med. and Surg. Journal.*

Proposed Prevention of Rabies.—Dr. L. L. Dorr, of this city, in a paper published in the N. Y. *Medical Journal*, dwells on the fact that no case of hydrophobia, in dog or man, has ever been known on the Pacific coast of America, North or South, although dogs are abundant. This extraordinary fact appears to be well established; at least it is impossible to find any record or history of the disease. He attributes the immunity to some peculiarity of climate, probably its electrical condition. He proposes to test the influence of the climate by sending some dogs from the East immediately after their being bitten by a rabid animal, and keeping them properly secured until the result is ascertained. A more practicable plan would be, he suggests, to have a number of the many persons who are annually bitten by rabid dogs in the Eastern States and in Europe come to this coast, where the influence of the climate would be enhanced by the inspiration of hope. Even if the disease should come on under these circumstances, he thinks it might possibly be so modified as to render it susceptible of cure.

Mines in the East.—Hon. Thos. Wren, during his trip East, succeeded in disposing of some mining property, and returned with full authority to develop the Silver State Con. Work will be pushed in this mine with all possible dispatch. He reports that mining has received a black eye in New York, and that it is up hill work to interest any one in Eureka mines.—*Eureka Leader.*

There is copper all over Wyoming, from Cheyenne to the Yellowstone and the National Park.

Assessment Notice—Consolidated Pacific Mining Co.

Passing Events.

Taking of testimony in the Gold Run debrie suit at Sacramento has closed and the arguments will begin on Feb. 28th.

There is nothing startling to note from the mining regions. The decision in the Contention suit at Tombstone, to which we refer elsewhere, has settled an important dispute in that region.

The season thus far has been comparatively dry, though there is still plenty of time for a good fall of rain for the miners. The Grass Valley *Union* of the 1st says: The eight or ten-inch fall of snow last week was gradually disappearing, and as about all the fun that can be got out of a snow-storm in the footbills is the coasting that the boys can indulge in for a brief period, another visitation of the kind was not particularly desired, but on Monday night there was a gathering of the clouds, followed by a stiff breeze, which brought a snow-storm in its wake, and by 9 A. M. yesterday as much as eight or ten inches had covered the ground in this vicinity, and on higher ground to the east and south of town there was from 12 to 18 inches. If not followed by rain, this storm will prove of great advantage, as the gradual melting of the snow will start the water and give the mining ditches a supply that will start the hydraulic mines, which have done but little piping thus far for the season.

The fire which occurred in New York this week wrought damage to two of our worthy exchanges—the *Scientific American* and *Turf, Field and Farm*. The latter lost a fine library.

Drift Mining.

The gravel from some of the Blue Lead channel mines is very much cemented, rendering it not only expensive to mine, but costly to get the gold out, inasmuch as it resists the solvent and slacking action of water, and has to be crushed in a stamp mill before the gold in it can be obtained. Gravel to pay for crushing must necessarily be much richer than that which will pay by washing. The expense of milling is somewhat less with gravel than with quartz, as a coarse mesh screen can be used and a greater quantity crushed to the stamp. The cars from this mine containing gravel it is intended to mill are dumped on a screen, and the coarse cobble gravel separated and thrown aside as waste.

Drift mining through a vertical or inclined shaft is necessitated whenever it is impossible to reach the gravel by a tunnel, or where the latter would be very long and costly. The shaft, as to first cost of reaching gravel for almost all drift mines, would be less than the running of a bedrock tunnel, but for taking out gravel, the latter is of course far superior. In mining through a shaft it is necessary to raise the pay gravel and mine waters to the surface; for this, hoisting and pumping machinery are necessary, and their entire cost of construction and running are additional to what the expense would be if the mine were opened by a tunnel. Practically, it costs about as much to bring the gravel in any mine extensively worked from the point where broken out to the shaft, and to load it into the cage or bucket, as to car it out of the mine through a tunnel of 1,500 to 3,000 ft. in length. A mine worked through a shaft must yield richer gravel, in order to be worked profitably, than if worked through a tunnel. How much richer, depends greatly on how extensively the mine is being worked, the cost per ton of hoisting, decreasing as the aggregate daily amount hoisted increases. Drift mining became

A Branch of Placer Mining

In this State very soon after the discovery of gold, and it is probable that in the aggregate the gold yield of the drift mines is as large as that either from hydraulic mining or from the surface placers. The tunnels run for drifting are found throughout the entire auriferous gravel regions of the State, and are particularly numerous in regions where the lava-covered channels are found. By far the greater number of these are abandoned, many of them after failing to develop paying mines. Hundreds of tunnels from a few hundred to several thousand ft. in length, through errors in judgment as to the location of the channel, have not been run low enough to get out the gravel, or have missed finding it at all. Drift mining is not now carried on as extensively as during the 15 years from 1855 to 1870, the readily accessible ground having been worked out, and much of what was not prospected then requiring too large an outlay of capital, without any absolute certainty of return. At the present time, the counties of Sierra, Nevada, Placer and Plumas contain most of the working drift mines.

The Hidden Treasure

Drifting mine, at Sunny South, in Placer county, is a fair sample of a drift mine worked under favorable circumstances. It is located on a channel running nearly north and south and having a grade to the south, from which it is worked, of about 70 ft. to the mile. The working tunnel run in on the same grade as the channel, ascending 70 ft. to the mile, keeps about 30 ft. below the surface of the bedrock in the channel. Its length is 3,000 ft. The contract price for running it in a soft slate requiring but little blasting, timbers and track being furnished, is $3.50 per ft. The total expense, including timbers and iron T-rail track, is about $4 per ft. From this tunnel upraises are made every 125 ft. to the gravel, which is blocked off in squares of that length of face. The channel is worked for a width of 500 ft., the pay-gravel being from five to six ft. deep, and consisting for the most part of quartz, pebbles and bowlders, the latter sometimes of many tons' weight. The gold is of 922 fineness and ranges in size of pieces from one-half ounce down. About 60 men are employed as miners breaking out the gravel and timbering. The wages paid are $2.50 per day. The timbers and lagging are cut by contract during the summer, eight or nine men being thus employed. Twelve thousand timbers of all kinds and 80,000 lagging are used annually. From 150 to 200 cars of gravel, of about 3,500 lbs. weight each, are taken out of the mine daily. For a long time it required 10 men to run the cars; at present two horses and two men do the same work. One man is employed washing the gravel and several others as blacksmiths, carpenters, etc. During 1880 the value of gold taken out was $115,000; the expenses, $50,000 for labor and superintendence, and $8,000 for all other expenses, material and supplies, leaving a net profit of $57,000. The mine is owned in 35 shares, for the most part held by working miners and the original locators of the claim.

The Mountain Gate

Drifting mine, at Damascus, is located on the northern end of the same fragment of buried channel as the Hidden Treasure, and only a few miles distant from it. The main tunnel is in 6,500 feet, and the channel above it has been worked out that distance for a width of 200 to 250 feet. For the method of opening up the gravel and other details, the description given as to the Hidden Treasure mine will apply. This channel has the same quality of gravel, the same grade, and by connecting surveys is established to be beyond question the same channel as that on which the Hidden Treasure is located. This is, however, not the only channel in the mine; 6,500 ft. in this channel is sharply cut off by lava, or cement as it is usually termed among the miners, but by running an incline in this cement another channel, running from northeast to southwest, was found 80 ft. lower than the original channel. It is of about the same width as the other, but contains an entirely different kind of gravel, being a blue gravel containing granite pebbles and bowlders instead of quartz. The gold, too, is different, being flake-gold of approximate uniformity in size and being a trifle finer quality. This lower channel contains a larger and richer body of gravel than the old one, but it is worked at a considerable disadvantage. The mine from the old workings run from the face of the mountain inward and under ordinary circumstances would be carried through the upraises into the lower tunnel, and thence, running in the opposite direction, pass out of the mine. Instead of going from the workings into the lower tunnel at every convenient point, the waters are collected in a reservoir, cut in the cement at the inner end of the old workings 6,500 ft. in the interior of the mountain; from this tank there is 40 ft. fall to the lower tunnel. A large overshot wheel, 30 ft. in diameter, is run by this water, and furnishes sufficient power to pump the small amount of water found in the lower channel and to draw up the loaded cars of gravel. The labor employed in all capacities numbers 45 men: 36 miners; 2 men at waterwheel; 2 driving cars; 2 blacksmiths; carpenter, gravel washer and superintendent. Six men are employed on contract during the summer, cutting timber and lagging. The monthly yield for several months past has been from $10,000 to $12,000. The total yield of the mine so far has been about $1,500,000, nearly all from the old quartz gravel channel. The mine is owned similarly to the Hidden Treasure—in shares held principally by working miners.

The Hidden Treasure and Mountain Gate drift mines, just described, are representative of all this class of mines, and are fair models as to what a drift mine should be. Each drift mine, though, is liable to have conditions peculiar to itself, requiring modification of the methods of opening and working described in these papers.

Electricity and Minerals.

Many minerals become electrified, and capable of attracting light bodies after being heated or rubbed. These are said to be pyro-electric or friction-electric. Friction with a feather is sufficient to excite electricity in some varieties of blende, while most tourmalines are pyro-electric. Some minerals, such as topaz, will retain their electricity for hours; others lose it in a few minutes.

A very simple and delicate electriscope for testing this property can be made from a bent glass rod, from which a minute fragment of gilt paper or gold leaf is suspended by a single fiber of silk. On approaching a substance whose electricity has been excited by any method, the suspended fragment will move toward it.

Electricity is of two kinds, each being the opposite or complement of the other. That excited by rubbing a glass rod with silk is called vitreous or positive, while the electricity developed by rubbing sealing wax or sulphur with wool is called resinous or negative. Niter, fluor, apatite, aragonite and epidote, acquire negative electricity by friction, while sulphur, wolfram, tantalite, mispickel and cassiterite, develop positive electricity.

Some crystals while exposed to an increasing temperature exhibit positive electricity at some points of their surface and negative at other points; while the temperature is falling, these points are charged with the opposite electricities. The points at which an ascending temperature develops positive electricity are called analogous poles, and those which develop negative electricity, under the same circumstances, antilogous poles.

THE CALIFORNIAN.—The *Californian* for January shows the introduction of new and progressive features, and is evidence that the editor and proprietor, Mr. Phelps, is urging his publication forward with enterprise and confidence. Several articles are well illustrated, and more in this line is promised hereafter. The articles have a Western localization and coloring which is very acceptable both here and abroad. The contents show an abundance of light and graceful literary work, and attention, also, to the material interests of the State, which will make the *Californian* an active power in both the culture and progress of the coast. The publication has our best wishes for its manifest spirit and accomplishment.

THE miners of Central district are shipping their ores to the Winnemucca Reduction Works by mule teams, side by side with the railroad. The Winnemucca *Silver State* says this speaks volumes for mule power.

New Quartz Crusher.

Allen Oliver, Forest Hill, Placer Co., in this State, has patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, an improvement in quartz crushers in which a reciprocating rolling weight is fitted to oscillate upon a bed or mortar into which the material to be crushed is fed. This device consists in an improved means for producing the reciprocating rolling motion of the segmental crushers and in keeping them in place, so that they do not slip in the mortars, while they are allowed to rise and fall as the material beneath them increases or diminishes. This is effected by a series of connecting rods which produce a parallel motion, these rods passing through holes on guides which move vertically in the closed mortar or box, so as to keep a tight joint, while allowing the rods to move up and down in their oscillations.

The mortar beds of the apparatus are supported on a strong frame or bed, and there are as many as may be desired, placed side by side and provided with any suitable feeding device. Within these mortars, the segmental crushing weights are fitted, so that their rims or crushing faces will rest upon the bed. These segments may be united so as to stand side by side, each segment standing in its own mortar, and a shaft passes through their upper ends, extending out upon each side so as to receive the ends of the pitman or connecting rods by which the segments are caused to roll or oscillate. An arm or plate extends downward from this shaft, upon each side, to a point below the level of the mortar bed on the bottom of the segments, and rods extend back from pins on these arms.

A system of rods and connections is formed so as to form a parallel motion which prevents the segments from slipping on the mortar, but allows them to rise and fall to accommodate themselves to the amount of material in the battery without in any way disarranging their motion.

A Bureau of Mines and Mining.

The following is a bill introduced by Mr. Belford, of Colorado, in the House of Representatives, and referred to the Committee of Mines and Mining:

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, that a bureau, to be known as the Bureau of Mines and Mining, be established in the Department of the Interior, and connected with the Geological Survey, heretofore provided for by law. The purpose and object of said bureau shall be to gather statistics and acquire information respecting the mines and mining operations of the United States, and to report such statistics and information annually, through the Secretary of the Interior, to Congress, for use and dissemination. There shall be at the head of said bureau one chief, who shall be skilled in the knowledge of minerals and mining, to be appointed by the President, with the advice and consent of the Senate, at a salary of $3,000 per annum; one assistant mineralogist, at a salary of $2,000; one chief clerk, at a salary of $1,600; two assistant clerks, at a salary of $1,200 each; four mining experts, at a salary of $1,600 each; and one messenger, at a salary of $600.

SEC. 2. That a bureau, to be known as the Bureau of Manufactures, be established, to be connected with the Department of the Interior. The purpose and object of said bureau shall be to collect statistics and information respecting the various manufacturing industries of the United States, and to report the same annually, through the Secretary of the Interior, to Congress, for use and dissemination. There shall be at the head of said Bureau of Manufactures one chief, to be appointed by the President, with the advice and consent of the Senate, at a salary of $3,000; one chief clerk, at a salary of $1,600; two assistant clerks, at a salary of $1,200 each; four experts, at a salary of $1,500 each; and one messenger, at a salary of $600.

SEC. 3. That there shall be established, to be under the Department of the Interior, a bureau, to be known as the Bureau of Labor Statistics. The purpose and object of said bureau shall be to collect and disseminate statistics and other information respecting the condition, skill, efficiency, and pay of labor in the various parts of the United States and in the various trades and avocations. There shall be at the head of said bureau one chief, to be appointed by the President, by and with the advice and consent of the Senate, at a salary of $3,000; one chief clerk, at a salary of $1,600; two assistant clerks, at a salary of $1,200 each; and two experts in gathering statistics, at $1,500 each. It shall be the duty of the chief of said bureau to make an annual report of the statistics and other information relating to the condition, skill, and pay of labor in the United States annually, through the Secretary of the Interior, to Congress.

SEC. 4. That the bureau now known as the Bureau of Statistics shall hereafter be known as the Bureau of Commerce.

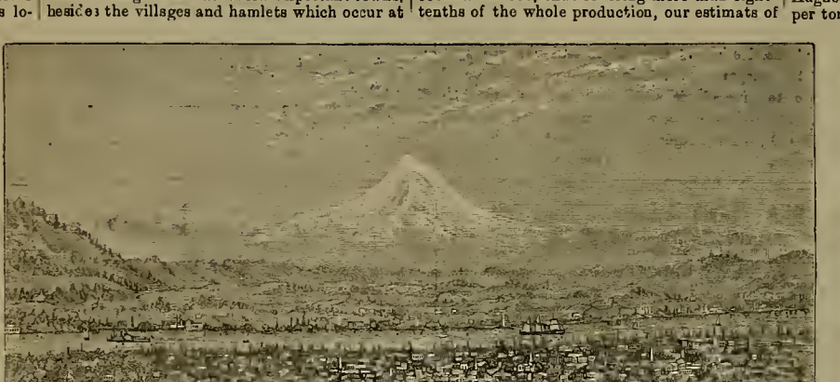
THERE is evidently good ground for the anticipated flow of gold from this country to Europe. The exports of breadstuffs for the year 1881 were $52,000,000 less than for the preceding year. The beef, pork and butter exports also show a large decline. The generally accepted explanation is the drought of 1881, causing a shortage and high prices.

Situation and Surroundings of Portland.

We give on this page a handsome engraving showing Portland, Oregon, and some of the notable features of the country surrounding it. The growth and prospects are themes which the Oregonian never tires to talk about, and they are matters in which all who enjoy the growth and development of the Pacific coast will take an interest. Of late years, Oregon and Washington Territory have secured a large share of the immigration to this coast, and the settlement of the country and the increase of its productions has been notable. It cannot be doubted that progress in this direction has but just set in, and that the coming completion of through lines of transportation eastward will add a new impetus to all industries and swell the population of all well-placed towns, while at the same time it will plant new towns and new country homes upon the vast and rich region which is still unoccupied.

But it is rather of the city of Portland and its immediate surroundings of which we would speak at this time, to enable the reader to understand better the engraving. And in so doing, we shall be free to take paragraphs from local writers, who will present a more appreciative view of the scene than anything we could ourselves prepare.

"Portland—in latitude 45° 30′ north, longitude 122° 27′ 30″ west—is a port of entry, the county seat of Multnomah county, and the commercial metropolis of Oregon. It is pleasantly located on the west bank of the Willamette river, about 13 miles above the junction of the Columbia, and about 110 miles—by the river course—from the Pacific ocean. The city is located on a plateau, which gradually increases in hight as it recedes from the river, until it forms a range of hills at the western extremity of the city, from which may be seen the snow-capped summits of Mounts Hood, St. Helens and Jefferson, the Cascade range of mountains, and the meanderings of the Columbia and Willamette rivers."



PORTLAND, WILLAMETTE RIVER, AND MOUNT HOOD.

Approaching Portland on board a steamer from San Francisco, at the present time, one's first impression of the place is usually of a decidedly unfavorable character, owing to the long line of dingy-looking docks that obstruct the view. However, on landing and passing from street to street, a city of peculiar beauty is opened to the view, and one is surprised at the massiveness of the buildings and general thrift displayed in all branches of business. However, one blot on the otherwise unsoiled picture consists in the narrowness of the streets, most of which are but 60 ft. in width. This defect, however, is soon lost sight of as we move from place to place and see on all sides unmistakable signs of wealth and comfort. From the summit of the hills above referred to, a scene of simple grandeur is unfolded. Away to the north the whole face of the country is dark with timber, through which the silvery water of the Willamette is plainly visible until it empties into the great Columbia, 12 miles distant.

From far up the Columbia, the bright water may be seen as it moves steadily onward to the sea, and it is only lost to sight in the dim distance far to the west. Slightly east of north and beyond the Columbia, the quiet little village of Vancouver is plainly visible, while, overlooking the river to the east of it may be seen the government reserve with its barracks and parade ground, while in the latter a tall mast supports the stars and stripes as they proudly wave in the free air of Heaven. To the right of this, and far off in the north, the pure white summit of St. Helens may be seen reaching above the surrounding mountains, standing 9,570 ft. above the level of the sea; behind it Rainier shows its cap of perpetual snow looming up in the heavens for 14,444 ft. Two other snow-capped mountains are seen to the right, but to grand old Hood, "the pride of Oregon," is ascribed the honor of capping the climax, as it sits in its silent glory, 11,255 ft. high, off in the mountains to the east, perfectly formed, symmetrical and beautiful.

Of Mt. Hood, as it sometimes appears from Portland, a writer in the *Telegram* says: "The day had been cloudy, but the clouds parted just before night so as to send the rays of the sun, as if concentrated for that special purpose, upon the distant Mt. Hood. The effect was to make the snow-capped king of the Cascades appear to lose the 60 miles between us and its great snow-white sides, so that the rough contour was brought out by light and shade with such distinctness, that it appeared as if drawn within a few feet of us; so while we were enjoying a warm, sunshiny evening, with rich, green hills surrounding our city, there stood an enormous pile of the purest and whitest snow at our very doors. It is indeed surprising the variations in the appearance which our beautiful mountain presents to the people of this city, and the whole State, in the different shades of light thrown upon it from different directions as the sun moves over us in his daily rounds. Never twice alike, we are always seeing new beauties in the everlasting hills, and especially the great white-capped mountains seen from this city, Mounts Hood, St. Helens, Rainier and Adams."

The city of Portland embraces a population of about 25,000 of all nationalities. It is the first city in point of wealth, proportionally to size, in the Union. Practically, all phases of life, except extreme poverty, and all occupations to be seen in any American city, are observable here. The tone is higher, as prosperity of sober, industrious labor is greater, and the success of success is more productive of wealth. The proportion of wholesale to retail houses in all lines of trade is much greater than would be expected of its inhabitants. For instance, the number of wholesale groceries actually exceeds the number of first-class retail houses in the same line. The business of several of the former reaches into millions annually. It may truthfully be said that Portland is the market-place for the north Pacific coast, the granary of Oregon and Washington, and the treasure vault of the whole northwest country.

Thirty years ago the city of Portland was little except a dense fir forest, with here and there a clearing yet full of blackened stumps. There were several business houses, where trade was brisk, and a number of temporary buildings for family dwellings, with a noticeable preponderance of hoarding houses and gambling dens. Initial steps had been taken to establish the schools and churches that have since grown into prosperity and permanence. There were no regular sidewalks or public street lamps, and the visitor carried away vivid recollections of the abounding mud. Portland has since grown into a city of over 20,000 inhabitants, is the point where all the great railroads of the present and the future are to meet, and her maritime interests control the entire commerce of the Pacific Northwest. Her schools are second to none in North America.

Our engraving gives a section of the Willamette valley, which is the most famous agricultural region of Oregon. The valley is about 200 miles in length and has several important towns, besides the villages and hamlets which occur at short intervals. Farm houses abound, and orchards; and meadow lands stretch away into little valleys. Level prairies are encountered here, hillowy hillocks there, and dark green forests yonder, diversified occasionally by dense groves of undergrowth. The timber in the valley is principally oak and fir, the latter predominating.

The Willamette valley is famous for its moist climate, its dripping skies being a by-word through the outside world. But it seems that the dwellers there rather enjoy it. In fact, some local writers would have us believe that the inhabitants get so used to rain that they cry for it. We quote as follows:

"The resident will grow to like the humid atmosphere, and, as his years advance, will learn to long for rain when lowering weather ceases. He will learn by gratified experience that the rainy seasons, of which the temporary visitor to the Willamette valley usually complains to the outside world, are not the terror he has been led to imagine. And yet the climate is excessively humid in winter along the coast, and also in the great valleys between the coast and Cascade mountain ranges. There is rain enough to make the unmade roads of a new country very muddy and disagreeable, and to keep them so till the summer sunshine comes to the rescue. But the same humidity that spoils the roads bathes the mountains in perpetual green, and so fructifies the valleys that crops never fail, and all the abundant and varied products of the soil are of the very best quality."

THE military reservations reported to the House as no longer needed by the War Department, are: Fort Fetterman, Wyoming Territory; Fort McPherson, Nebraska; Camp Sheridan, Nebraska; Camp Independence, California; Fort Hartsuff, Nebraska; Fort Benton, Montana Territory; Fort Steilacoom, Washington Territory; Whipple Barracks, Arizona; Coal reservation, on Sulphur creek, Wyoming Territory; Fort Dodge, Kansas; Fort Lyon, Colorado.

LEADING Paris financiers have decided to guarantee the loan of $5,000,000 francs, required by authorized brokers.

The Copper Mining Industry.

The recent advance in the price of copper has attracted attention to that metal to a larger degree than for several years past. In fact, for the first time the copper mines of this coast have appeared as producers on such a scale as to affect the market in the East and elsewhere. To illustrate the relative importance of the various producing districts we take from the *Engineering and Mining Journal* a table, the figures of which, it says, are the result of a careful study of the subject by gentlemen closely allied to the trade:

	Estimated product in 1881.
Michigan	53,000,000
Maine	100,000
Maryland	100,000
Missouri	200,000
North Carolina	2,000,000
Pennsylvania	500,000
Vermont	2,500,000
Wisconsin	
Arizona	8,000,000
Colorado	1,750,000
California	500,000
Idaho Utah Montana	1,750,000
New Mexico	500,000
Sulphur ore from Canada	500,000
Nevada	250,000
Georgia	50,000
Total	71,300,000

According to the statistics officially gathered by Mr. C. E. Wright for the Lake Superior district, the production was 49,738 367 lbs. for the whole year of 1880; and as the output of five of the principal mines, Calumet & Hecla, Quincy, Osceola, Franklin and Pewabic, was a little above 46,000,000 lbs. in 1881, against 42,500,000 lbs. in 1880, thus covering more than eight-tenths of the whole production, our estimate of an increase of 3,250,000 lbs. is a safe one. The Arizona estimate is according to the latest returns.

The item "Sulphur ore from Canada" is a suggestive one. This is the first time such an item has appeared. The ore in question is used for the manufacture of sulphuric acid, and is subsequently treated for copper. The use of pyrites will probably increase here, and, as in England, become the source of considerable quantities of metal.

During the year, the excess of exports over imports was about 7,000,000 lbs., so that the consumption was about 64,000,000 lbs.; the stocks at the close of the year in producers', dealers' and manufacturers' hands being probably lower than at the corresponding time last year.

The highest prices of the year 1881 were at the close of the last month of that year, 20½ cents. The authority above quoted, with regard to our mines on this coast, says: "The course of events for the last two months has been extremely favorable to the development of copper mining enterprises in the West, and, with the growing interest of capital in those ventures, a rapid opening of the country by railroads, a decrease in the cost of transportation, of fuel, and of labor, the Arizona, New Mexico, and other copper mines have a bright future before them, if prudently managed. In the past, our copper producers have been forced to send a surplus abroad, and even in the last year we exported about 6,500,000 to 7,000,000 lbs. If the West becomes a heavy producer, it must seek to conquer and hold the markets beyond the Mississippi by the establishment of brass foundries and rolling-mills in that section. To do this, it will have to compete with the magnificent plant of the Naugatuck valley, against long experience and against a long-established and well-organized industry. The advantages with which it will enter into this contest will be those offered by a saving of freights to the Eastern mills, and return freights on the product to the West, and this will probably be more important to the Northern mines than to those of the southern tier of Rocky mountain States and Territories. The coming year may be one of interesting developments in the copper trade, and the scare which was caused by the opening of the new districts during the last summer is an earnest of the possibilities of the future. While, from present appearances, the outlook is a very promising one, prudence demands that those engaged in copper mining should not forget that we are rapidly approaching a point where production will outstrip consumption. It has often done so in the past, when the Lake mines were the only producers and were ready to sacrifice a portion of the product for export, to hold up prices at home. It is a question whether they will be prepared to continue such a policy until they can succeed in coming to an arrangement with their Western competitors."

England is the great copper market, and London and Liverpool its centers. James Lewis & Sons, of Liverpool, have issued a report on copper for the year 1881, from which we take the following extracts, which will be of interest to our copper mining readers:

During the first eight months of the year 1881 the value of copper varied but little, the extreme rangs over which the prices paid for Chile bars extended being £5 10s. per ton, the highest point touched being £62 10s., early in January, and the lowest £57, on the 16th of May. After the 1st of September, however, a great change came over the market, and during the past four months a very large business has been done in furnace material, Chile bars and English manufactured copper at steadily advancing prices, the increase in the value of Chile bars during this period being £12 per ton, from £59 to £71; and of ore 2s. 4½d. per unit, from 11s. 9d. to 14s 1½d. During May bars fell to £57, but with moderate charters and large sales of furnace material advanced to £59, which was continued to £59 15s. in June, but was quickly followed by a reaction to £58 5s. In July and August the extreme fluctuations were only 10s. per ton, from £58 10s. to £59.

The Board of Trade returns of the imports and exports of copper are quite elaborate, and from them we condense the following figures: The imports of ores for 1881 were 102,640 tons, equal to 12,614 tons fine. Imports of regulus, 8,116 tons, equal to 3,652 tons fine. Imports of precipitate, 36,110 tons, equal to 21,660 tons fine. Bars and ingots equal to 32,170 tons fine. Pyrites, 542,046 tons, equal to 13,551 tons fine.

The exports were as follows: Wrought and unwrought, 34,698 tons fine; yellow metal, 9,440 tons fine; brass, 3,264 tons fine; foreign unwrought, 13,790 tons fine. Total imports, 83,647 tons fine; exports, 61,692 tons fine; difference, 21,955 tons fine.

The apparent English consumption of foreign copper ores, 28,044 tons fine; production of Cornish mines, 2,583 tons fine; British ores sold at Swansea, 435 tons fine; total English consumption of copper, 31,062 tons fine. Stocks of copper of all kinds in England at the end of the year, over 35,306 tons fine. In France they had on hand 3,437 tons fine.

The average price of English precipitate, for 1881, was 12s. 8 3-16 d., and the average in 1881 was 12s. 11d.

Import of Spanish precipitate and copper produce from all countries except Chile, into Liverpool and Swansea was, in 1881, 23,434 tons fine.

Import of Australian, etc., copper into London 9,249 tons fine.

Import of Chile ore, regulus, bars and ingots into England 27,357 tons fine.

Import of Spanish pyritea (as per Board of Trade returns) into England, 13,551 tons fine.

Total import of copper produce into England 73,591 tons fine.

Import of American, etc. copper into France 3,205 tons fine.

Import of Chile copper into France 13,231 tons fine.

Total import of copper produce into France 16,436 tons fine.

Total import of copper produce into England and France 90,027 tons fine.

Export from Chile to all countries 38,000 (estimated) tons fine.

The Board of Trade figures for the year, which differ considerably from those made up by the members of the copper trade itself, show the following results compared with the year 1880:

The import of Spanish pyrites and precipitate is only 600 tons in excess of last year, the decrease in the former being nearly equivalent to the increase in the latter.

The import of ore is about 600 tons fine less, the falling off from Chile and the Cape being nearly compensated for by that from other countries.

The import of ingots, bars and regulus from Chile is about 6,400 tons less, and from Australia and other countries 1,100 tons less.

The total import is 7,400 tons less, and the export 2,200 tons more.

This difference is obtained by a reduction in the stock of 6,100 tons, whereas, last year there was an increase of 2 300 tons.

The home consumption must consequently have been about 1,200 tons less than during 1880, but 900 tons greater than during 1879.

THE verdict in the Guiteau trial elicits from the London *Times* the most offensive article it has published since the Rebellion. It declares that the American people are satisfied with the conduct of the trial, which was a broad farce enacted in court, without one symptom of popular disapprobation.

CHICAGO **FRASER & CHALMERS,** ILLINOIS.

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin for Giant and Old Abe Co., Black Hill s also Corliss Pumping Engines, 28x00, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. McCaskell's Patent Car Wheels and Axles—Best in Use.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Plango Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

DEWEY & CO.'S

Scientific Press **Patent Agency.**

[ESTABLISHED 1860.]

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other Agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

COMPOUND OXYGEN NOT A DRUG

A NEW TREATMENT for Consumption, Asthma, Bronchitis, Catarrh, Dyspepsia, Headache, Debility, Neuralgia, Rheumatism, *and all Chronic and Nervous Disorders.*

ACTS DIRECTLY upon the great nervous and organic centres, and *cures by a natural process of revitalization.*

HAS EFFECTED REMARKABLE CURES, which are attracting wide attention.

HAS BEEN USED BY Rt. Rev. John J. Keane, Bishop of Richmond, Va., Hon. Wm. D. Kelley, T. S. Arthur, and others, who have been largely benefited, and to whom we refer *by permission.*

IS STRONGLY ENDORSED: "We have the most unequivocal testimony to its curative power from many persons of high character and intelligence."—*Lutheran Observer.* "The cures which have been obtained by this new treatment seem more like miracles than cases of natural healing."—*Arthur's Home Magazine.* "There is no doubt as to the genuineness and positive results of this treatment."—*Boston Journal of Commerce.*

THE OXYGEN HOME TREATMENT contains two months' supply, with inhaling apparatus and full directions for use.

SENT FREE: a Treatise on Compound Oxygen, giving the history of this new discovery and a large record of most remarkable cures. Write for it. Address

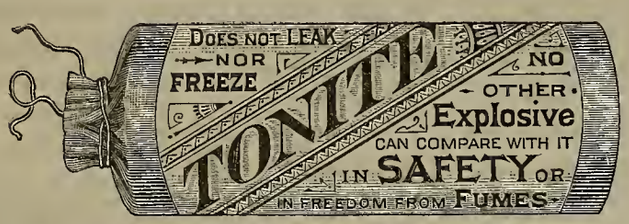
ADMINISTERED BY INHALATION. Drs. STARKEY & PALEN, 1109 and 1111 Girard St., Philadelphia, Pa.

Depository on Pacific Coast.

WE HAVE ESTABLISHED A DEPOSITORY OF OUR COMPOUND OXYGEN HOME TREATMENT at San Francisco, Cal. This will enable patients on the Pacific Coast to obtain it without the heavy express charges which accrue on packages sent from Eastern States All orders directed to H. E. MATHEWS, 606 Montgomery street, San Francisco, Cal., will be filled on the same terms on which we fill orders sent directly to our office in Philadelphia.

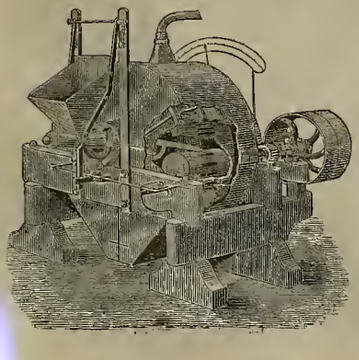
Patients ordering from our depository in San Francisco, should, at the same time, write to us, and give a statement of their case, in order than we may send such advice and direction in the use of the Treatment as their special disease may seem to require.

DRS. STARKEY & PALEN, Nos. 1109 and 1111 Girard Street, Philadelphia, Pa.



TONITE POWDER COMPANY, - - 403 California St., S. F.

TUSTIN'S ROTARY PULVERIZING MILL.



WORKS ORE WET OR DRY,

And Feeds Itself Automatically.

Patented October 11, 1881.

One of these machines can be seen at the Ore Sampling and Pulverizing works of Hofmann Bros, No 415 Mission St., where it is working every day. Weight 5,000 lbs., heaviest piece 480 lbs.

Manufactured at the

TUSTIN WINDMILL, HORSE POWER AND PUMPING MACHINE WORKS.

308 Mission Street, S. F., Cal.,

By W. I. TUSTIN, Inventor and Patentee.

Trenton, N. J. 117 Liberty St., N. Y.

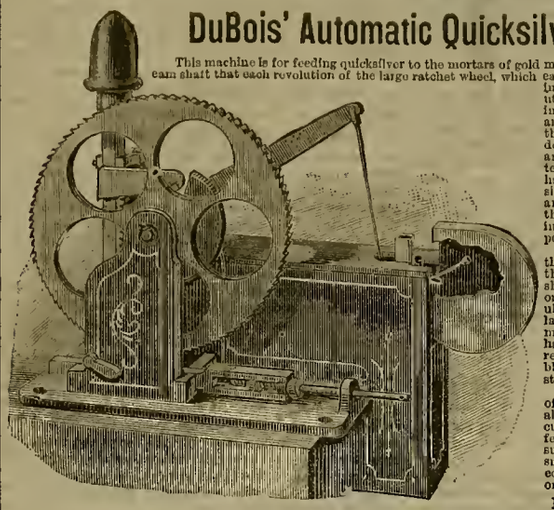
FRANCIS SMITH & CO.,
Manufacturers of
THE PATENT CHANNEL IRON WHEELBARROWS.
THE STRONGEST BARROW MADE. These Barrows are made by Superior Workmen, and of the best material. All sizes kept constantly on hand

SHEET IRON PIPE.
Lap-Welded Pipe, all Sizes, from Three to Six Inches. Artesian Well Pipe. Also, Galvanized Iron Boilers, from 25 to 100 Gallons.
Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools supplied for making Pipes. Estimates given when required. Are prepared for coating all size of Pipes with a composition of Coal Tar and Asphaltum.
Office and Manufactory, 130 Beale Street, San Francisco.

SHEET IRON PIPE.

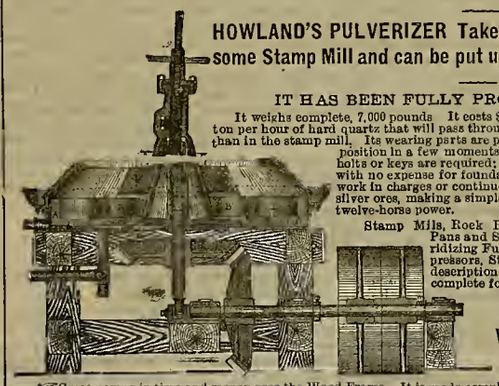
DuBois' Automatic Quicksilver Feeder.



This machine is for feeding quicksilver to the mortars of gold mills. It is so connected to the cam shaft that each revolution of the large ratchet wheel, which can be regulated to revolve once in one, two, three or four minutes, as desired, dips a small cup into a reservoir of quicksilver, and by a trip of the cam, empties the contents into a pipe leading down to the mortar, supplying an exact quantity at regular intervals, superseding the ordinary hand feeding, which is of necessity subject to great irregularity, and liable to neglect. It renders the amalgamation of all the gold in the pulp equally certain and perfect.
The mechanism to produce this depression and elevation of the cup, is driven by the cam shaft, similarly to the self feeders, over which so much ingenuity has been expended to regulate the delivery of ore to the mortar. As it is to be desired to have the ore go in constantly and regularly, so it is equally desirable to have the mercury fed constantly and regularly.
A chief point of excellence of this machine is, that it allows the quantity of mercury which would be otherwise fed in mass, in one hour, to be subdivided into a number of small portions, and fed almost continuously, *i. e.*, from every one to four minutes.
Price, complete, $100.

For Sale by **WHITNEY & MARSHALL,** Sole Agents
22 & 24 Fremont St., San Francisco.
Dealers in Iron, Steel, Hardware and Mining Supplies, Wrought Iron Pipe and Fittings, Pump Columns, Wire Rope, etc. A large stock of Boiler, Plate and Sheet Iron of every description.

MOREY & SPERRY,
MANUFACTURERS OF
Gold and Silver Grinding and Amalgamating Machinery



HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.
IT HAS BEEN FULLY PROVED AND TESTED.
It weighs complete, 7,000 pounds It costs $1,500 ready for the bolt Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.
Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver ores Chloridizing Furnaces, Retorts, Rock Drills Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill supplies Iron Work complete for Wood Frames, also
SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.
☞Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.
MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

LEFFEL'S IMPROVED WATER WHEEL.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, No. 252 Market St., S. F.

FOR THE WEEK ENDING JANUARY 24, 1882.

252 723.—COFFEE FLAVORING—Frank Broz, S. F.
252,660.—PIN JEWEL HOLDER—F. Gundorph, Portland, Oregon.
252,776.—GRAIN HEADER—J. W. & A. B. Jory, Salem, Oregon.
252 616.—PEA SHELLER—F. Molini, S. F.
252,792.—QUARTZ CRUSHER—A. Oliver, Forest Hill, Cal.
252,793.—AMALGAMATOR—A. Oliver, Forest Hill, Cal.
252,803.—GRAIN SEPARATOR—D. Salisbury, Williams, California.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'e SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

AMALGAMATOR AND CONCENTRATOR.—Allen Oliver, Forest Hill, Placer county. No. 252,793. Dated Jan. 24, 1882. This invention relates to an apparatus for amalgamating and concentrating the valuable metals, and also for concentrating sulphurets; and the inventor calls it the "automatic hydraulic amalgamator and concentrator." It consists of two sluices placed side by side, and provided with gates which are operated automatically by suspended water boxes. A main sluice brings the pulp from the battery to these two sluices, and while one is receiving the pulp, the gate of the other is closed. The sluices have a double bottom, the upper one being perforated and provided with upwardly projecting brushes. A frame of water pipes, with transverse, wedge-shaped, hollow riffles, which are perforated for egress of water into the pulp, is moved up and down continuously to agitate the pulp and assist in concentrating. Suitable discharge gates are opened and closed automatically, and a flexible riffle at the outlet is operated in the same manner.

GRAIN SEPARATOR AND CLEANER.—Dexter Salisbury, Williams, Colusa county. No. 252,803. Dated Jan. 24, 1882. This invention relates to that class of agricultural implements known as grain cleaners, and it consists in certain details of construction difficult to describe clearly without engraving. The vibrating screens and elevators are arranged differently from what they usually are. In some there is but one elevator and ordinary screens, and in others the elevator takes the wheat directly from the cutting-in hopper, and delivers it upon the zigzag screens, thus accomplishing the result of separating the barley and large impurities at once, while the grain is full of the smaller chaff. In this invention under consideration, the inventor deems it best to clean out the small chaff first, so that when the grain is delivered to the screens, they will have nothing to do but separate the barley from the wheat, and cannot become clogged.

BOX COVER PRESS.—Edwin Austin, Winters, Yolo county, Cal. This invention relates to a new and useful device for holding down the lids of boxes in order that they may be nailed, and which, therefore, the inventor terms a "box cover press." It consists in vertically moving clamps or straps mounted on a suitable frame or table, said clamps being adapted to fit over the ends of the lid or cover, and, through the operation of a lever, be drawn down tightly therein to hold it fast down against the box while being nailed. Means are provided to elevate a low box to the hight of a higher box by hed pieces of different level, so as to keep within the limits of the vertical play of the clamps.

COMPOUND FOR FLAVORING COFFEE.—Frank Bros., San Francisco, No. 252,723. Dated Jan. 24, 1882. This is a compound which the inventor calls coffee flavoring, and which is employed to improve the taste and flavor of coffee. It consists of a peculiar preparation which is mixed and put up in packages ready for use when desired.

QUARTZ CRUSHER.—Allen Oliver, Forest Hill, Placer Co. No. 252,792. Dated Jan. 24, 1882. This device is described in full in another column of this number of the PRESS.

SENATOR GROVER has introduced bills appropriating $500,000 for the improvement of the mouth of the Columbia river, $750,000 for the construction of a canal and locks at the Cascades of the Columbia, and $200,000 for continuing the improvements at the entrance to Yaquina bay, Oregon. These bills, at the request of Senator Grover, were temporarily laid on the table, in order to afford him opportunity to call them up and submit some remarks on them, before their reference to the committee, at an early day.

Alaska Mines.

Fish River Mining District.

EDITORS PRESS:—This district was discovered in June of last year. It is situated in the "Omilak" range of mountains, 30 miles north of Golowin bay, on the north side of Norton sound, and about 90 miles northwest from St. Michaels, a trading station of the Alaska Commercial Co., and also of the Western Fur Co.

Two locations were made by the discoverers of the district in the interest of the Alaska Mining Co., now incorporated as the "Alaska Gold and Silver Mining, Milling and Trading Co." These locations, or claims, are 1,500 ft. in length each, by 600 ft. in width, and join on the summit of the ridge—one being the "Pioneer," on which a shaft was put down 22½ ft. in ore, and a cut made some 600 ft. below the shaft, finding the same character of ore as thus taken from the shaft. The other claim, the "Omiluk," is situated on the opposite side of the mountain. On this claim a shaft was put down 12 ft. in ore also, and of same general character as that in the first shaft. The ore is argentiferous galena, with some iron croppings. Limestone forms one wall, and micacious slate the other, and these walls seem to be separated about 200 ft., where the ore body crosses the mountains, leaving no doubt that there is an immense body of ore at this point. Some 15 tons of ore are now on the dump of the shafts.

The ore carries a very high percentage in lead, as is evidenced by the following assays:

	Silver.	Lead.
By Prof. Thos. Price, trace of gold	$121.28	83%
" " " " " " "	161.86	85%
" Selby Smelting Works	143.51	80%
" E. M. Cram, trace of gold	135.75	not given
" " " " " "	122.83	not given
" " " " " "	155.78	not given

Giving an average of $140.16 in silver per ton; add value of lead, say $70, and we have over $210 per ton of 2,000 lbs.

From the foregoing statement (and these assays were not made from selected specimens, for the entire body of ore taken out would give the same results), the percentage of lead is so great that no reduction works will be required at the mine. Should this ever become necessary, however, there is an abundance of timber near the mine for all practical purposes.

The company propose to send up to the mine in the spring a working force, to remain a year or more, and explore the mine to greater depth.

The mine is about 12 or 15 miles from a point on Fish river, whence scows or barges will take the ore to the vessel landing. The river transportation is about 50 miles. A light-draft stern-wheel steamer will be used to tow the barges up and down the river.

The ore will be moved to the river in the winter with horses and sleds, or by same process may be delivered at the vessel landing by drawing it 30 miles overland.

To mine and deliver this ore in San Francisco, it is estimated to cost not to exceed $50 or $55 per ton. Cost of delivering 1,000 tons in San Francisco, as above, will be $55,000. Value of 1,000 tons at $210, would be $210,000, leaving a profit of $155,000. This, it is believed, will be about the result realized the first year. After which the ore will be handled and delivered for much less than the above estimate.

Ultimately, a railroad will be constructed from the mine to the harbor, a distance of 30 miles, when the ore can be moved at any and all seasons of the year.

I notice in the PRESS of January 28th that a good account is given of the Baker mining district in Montana, by your correspondent "Yehrek," and in speaking of the Baker mine, the "oldest location" and most extensively developed of any in the district, he uses the following language:

"Ore from the mine, shipped to Omaha, netted over $100 per ton; this is certainly a good showing for a 20 ton lot not closely selected. In this connection it must be borne in mind that, before starting it on its long voyage down the mighty Missouri, it was hauled in wagons 250 miles." The ore in the Baker district is both milling and smelting. The ore, then, from Alaska is more accessible, and makes a better showing than that from Montana.

The climate of northern Alaska is not unlike that of Maine and Michigan, and not as cold as Montana and Minnesota. For six or seven months the Esquimaux live in cloth tents, and in the winter many of them live in pole or log huts. The mildness of the climate in this high latitude is attributed to the warm ocean current that flows north, along the eastern coast of Asia, through Behring's sea and straits to the Arctic ocean.

In all that part of Alaska bordering on Behring's sea and Norton sound to the Arctic ocean there were not 50 white persons up to 1882; but now that valuable and extensive mines have been discovered this isolated region will soon fill up with enterprising miners.

The natives are disposed to be friendly and willing to work, and the Government cannot be too vigilant in suppressing the sale of spirituous liquors to them, for it is the most deadly enemy they have ever encountered.

Under the present climatic condition northern Alaska will never be agricultural; its great wealth consists in its mines, furs and fish. Belts of timber run through northern Alaska, but there is no large or valuable timber north and east of the Aleutian islands, until you get up the Yukon into the interior. A. F. W.

Thoughts on Technical Education.

[Written for the PRESS.]

In making practical use of Prof. Davidson's suggestion (published recently in the PRESS) of establishing schools of art, trade and commerce, we meet at the outset two fundamental questions, which must be answered before we can proceed. These questions are: 1st. By whom shall these schools be founded and maintained; and, 2d, for whom shall they be maintained. I shall endeavor to answer both questions in this paper.

The first question:—In his exceedingly interesting summary of the progress of technological education in Europe, we notice two widely divergent sources of efforts. The effort of the State, which is illustrated by France, Germany and Russia; and the effort of the individual, illustrated by the Mechanics' institutions of Great Britain. And this is what we might expect from the nature of their governments. The first are essentially parental governments, the second is non-parental, leaving to the individual what he can do better than the State. In America, education has been considered one of the proper and important functions of the government; so important, that the very continuance of our liberties depends upon its maintenance. But there is a growing belief that is becoming too complex—that the fungus of politics is interfering in the selection of teachers and text-books and proper distribution of school moneys; and some go even so far as to say that in the great struggle for existence, higher public education is a hindrance and not a help. But the strictures on our educational system are common property. They are as equally recognized by the common mechanic who has no practical education whatever as by the head of the coast survey, who is compelled to unlearn the university graduate in order to make practical use of him.

If, then, we wish to improve our public-school system, we must not add new duties, but actually diminish the present ones, and when the remaining ones are perfected, then it is time enough to add others. Until then, special or technical education should be under the control of the individual, and natural pride should prompt our mechanics to form the first trade school.

The second question: Out of 100 children attending the public schools, 72 attend the primary, 24 the grammar, 3 the high school, and only about one out of 200 attends the University; and as the decrease, due to death, amounts to 5%, 3% and 2%, between the ages 5 and 10, 10 and 14, 14 and 17 years respectively, the difference of the above figures fairly represents the number who are compelled to leave school long before they have received even the rudiments of an education, but 20% of the children between the years 6 and 17 do not attend school at all, and so receive no education whatever.

The State has established a University and the city a high school, and it is idle to conceal the fact that these schools, though open to the poor, of course are practically for rich men's children. If, then, a technological school similar to the Stevens Institute were established here, there would simply result a transfer of students from the first-mentioned to the last-mentioned institution, while the great mass of our boys, the future mechanics of San Francisco, would not be benefited. Hence there is the paramount need of the establishment of a school that will benefit those boys who, at the age of 14 to 16 years, are compelled to begin to earn their daily bread. Such an one must of necessity be conducted in the evening and must recognize the fact that its pupils work all day, that they have but a limited time to study, that hard work is incompatible with hard study, and especially that they are *poor*. Such a school, whose studies embraced mathematics, mechanics, physics and chemistry and drawing, and the time five years of 40 weeks each and three nights per week, would do an incalculable amount of good with a comparatively small outlay of money. And as "there is no practice like the practice of the shop," the practical side of their education would be far better provided for than by any instruction in a school.

My answers then are: That individual enterprise, backed by an association of the members of a particular trade, should establish their own trade school, and the aim should be to provide instruction for the mass of its future members. The State could even offer material aid without affecting the management; for, as Franklin says: "Good apprentices make good citizens," and so it would also be benefited.

For the success of this scheme an apprentice law is absolutely necessary, and efforts should be made at the next Legislature to have one passed.

Those that will be directly benefited, the owners of foundries and machine shops, should take this matter in hand. The impetus given to trade last year will continue and augment; and the prophet predicts, that as California has supplied the world with gold and grain in the past, she will in the future supply the nations of the Pacific with the products of her skill and industry. And to do this, she will need skilled, educated mechanics and artisans.

But a little more discussion will do no harm; only let it be *dynamic* not *static*. But above all let us have RES NON VERBA.

Controlling Debris.

The following we take from the Gridley (Butte county) *Herald:*

Of late years the effects of hydraulic mining have been so marked along Feather river that the ultimate destruction of Oroville has become a mere question of time, and gentlemen well versed in the lay of the land and capacity of the mines above the city, are unanimously of the opinion that in less than five years the present site of the county seat will be a deserted waste of debris and tailings. This belief is entertained by many of the leading property-holders, as well as by a majority of the county officials. From Supervisor Gray we learn that a movement has been inaugurated having in view the preservation of the property and business interests threatened, and, also, the perpetuity of the prosperous community. Briefly outlined the plan is as follows:

To purchase sufficient land on the high plateau situated on the west bank of the river (between the western terminus of the bridge and the Infirmary) upon which to re-establish the town, and to remove such buildings as can be moved to the new site. Such buildings as cannot be transferred will be bought and paid for either in cash or by the erection of similar structures in the new town, as the owners may prefer. To accomplish this end, it is estimated that a capital of $5,000,000 will be required. A company of capitalists is now being organized to carry out the scheme. They expect to realize handsomely on their investment by throwing up a huge dam, fifty ft. high and one hundred ft. wide on top, and about one mile in length, across Feather river at a point four and a half miles below the present town site (just below Kent's pond), and then use the mammoth basin thus created (which will be at least five miles long and from one to two and a half miles wide) as a dump for the debris and tailings of all the hydraulic mines located up the river. These mines will be charged a reasonable rental for the privilege of running their debris into this reservoir. The dam will have three water gates located in it, arranged in such a manner that the water will flow through sieve work and enter the channel below the dam free of debris. Among the mines that are expected to use the reservoir are the Miocene, Hewitt, Powers, Minerva, Banner, Greek and Big Bend, and a number of other smaller properties. We are informed that the managers of some of these properties have already signified their willingness to contract for the privilege for a term of years, two companies offering $750,000 each per annum for the same. A rough estimate, based upon interviews held with the representatives of the larger companies, puts the income from this source at $75,000 per annum; and as the mines cannot be worked unless they have a dumping place—and it will take at least 30 years to fill up the basin—it is very apparent that the projectors will reap a large return upon their investment. That there is something more than sensational bosh in this matter, is evidenced by the fact that Supervisor Gray purchased quite a tract of railroad land adjoining the proposed town-site, while in San Francisco last week, on which to put the county buildings. It is a stupendous undertaking, but the interests at stake will justify it, and the amount of capital estimated upon would be ample to insure its successful termination.

News in Brief.

PNEUMONIA is very prevalent in Tombetone, Arizona.

LIEUT. MELVILLE will form five separate parties to search for Com. DeLong.

PIETRO MALDINI, a Swiss, was killed on Saturday at Santa Cruz by a large limb of a tree falling on him.

A MINING man named Adams, from San Francisco, died of hemorrhage of the lungs last Friday at Tombstone.

THERE is every indication of an enormous travel to Europe next summer, and nearly all the steamship lines are increasing their fleets.

IMMENSE amounts of property have been destroyed and much suffering caused by the great floods in the Cumberland and Tennessee rivers.

DAN'L B. FOSTER, a well-known river man, formerly purser on the Sacramento river boats, died at Portland, Or., recently, of acute rheumatism, aged 58.

CHICAGO is happy over the removal to that city of more than one large manufacturer of Cincinnati, who complains that he is overtaxed in "the Paris of America."

THE Joint Committee on the Death and Memorial Services of the late President Garfield, decided upon a programme substantially the same as that adopted for President Lincoln.

THE bill prepared by the Judiciary Committee of the Senate, for the suppression of polygamy, provides that no polygamist shall sit on juries, exercise the right of suffrage, or hold office.

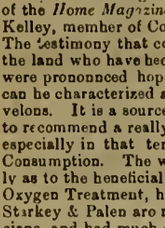
THE jury in the Sproul murder case, at Oroville, returned a verdict of not guilty, after an absence of 30 minutes, on Saturday. The verdict was enthusiastically received by the crowded courtroom.

A BILL has been introduced to extend the operations of the Lighthouse Board over the Willamette and Columbia rivers, from Portland to the sea, and appropriates $3,000 for the erection and maintenance of lights along these rivers.

Compound Oxygen Treatment.

We take pleasnre in commending to the carefulattention of our readers the "Compound Oxygen Treatment." This treatment is becoming very popular as a curative agent, for all diseases of the lungs, and other respiratory organs, consisting principally in oxygen inhalation. Dyspepsia, diseases of the liver, and nervous derangements are also cured by this wonderful agent. A New England physician discovered this great remedy for disease after an almost fatal attack of pneumonia, the results of which did not leave him for months. The dispensers of this Treatment have some of the very best testimonials as to its efficacy from those who have used it. Among those who testified to its curative properties are such men as T. S. Arthur, the distinguished author and proprietor of the *Home Magazine*, and Hon. William D. Kelley, member of Congress from Philadelphia. The testimony that comes from persons all over the land who have been cured of diseases that were pronounced hopeless, in many instances, can be characterized as nothing less than marvelous. It is a source of gratification to be able to recommend a really valuable remedial agent, especially in that terrible disease, pulmonary Consumption. The writer can speak personally as to the beneficial effects of the Compound Oxygen Treatment, hence this notice of it. Drs. Starkey & Palen are regularly educated physicians, and had much experience and successful practice before adopting this Treatment as a specialty.—*Shore Line, Conn., Times, New Haven, Sept. 24th, 1880.*

THERE are two colonies of Mormons in Arizona that are free from Territorial and county taxes. They are so isolated that the cost of collecting amounts to more than the taxes.



Dewey & Co.'s Patent Agency and Newspaper Offices.

Dewey & Co.'s Patent Agency and the business offices of the Mining and Scientific Press, Pacific Rural Press, Pacific States Watchman and the Fraternal Record are now conveniently situated at No. 252 Market Street. Elevator entrance, *No. 12 Front St., S. F.*

Business Offices and Sunny Rooms to Let.

We have some desirable rooms to let adjoining the offices of this paper which will be rented on favorable terms. Stair entrance, No. 252 Market St. Elevator, No. 12 Front St. Parties wishing offices, etc., will do well to call and see them. DEWEY & CO.

Cylinder Printing Press for Sale.

A large cylinder Hoe printing press, for country newspaper work, can be bought cheap by addressing
Press, Box 2361, S. F.

Sewing Machines.

Several first-class styles, good as new, will be sold at a bargain. Call on or address H. F. D., at this office.

PERSONS receiving a sample copy of the MINING AND SCIENTIFIC PRESS *with this notice marked*, are requested to examine the merits of the same, and consider fairly its claims for support, and if consistent, subscribe for the paper through the P. M. or agent delivering it, or otherwise. We shall send it, on trial, at the rate of $4 per annum for any period the reader may wish. Please notice our terms elsewhere, and if desired, send for further samples and information. Those who can circulate this No. further to our advantage are invited to do so.

A TURNED LEAF will point out the article supposed to be of special interest to persons receiving sample copies of this paper.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

BOOKSELLERS, STATIONERS, ETC.—Messrs. Payot, Upham & Co., No. 204 Sansome Street, are one of the oldest, most enterprising and reliable firms in the book and stationery trade in San Francisco. Scientific, industrial and foreign publications are a specialty with them. They are also noted for their first quality of blank book and fine stationery line of goods.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $3 per (half-yearly) volume. In cloth and leather binding, $5. These volumes, complete, are scarce and valuable for future reference and library use.

THE State Mining Bureau, No. 212 Sutter street, is open to the public from 10 o'clock A. M., to 5 o'clock P. M daily, (Sundays excepted). Henry O. Hanks, State Mineralogist.

ANNUAL STATISTICIAN of 1881.—"It is the most complete and accurate work of its kind in the world."—*S. F. Call.* Address L. P. McCarty, 518 California st. Price, $4.

COPP'S "U. S. MINERAL LANDS, LAWS, FORMS, INSTRUCTIONS AND DECISIONS."—1881. 570 pp. In full law binding, $4.50; half law binding, $3, at this office.

Mining and Scientific Press.

THE MINING AND SCIENTIFIC PRESS is the leading mining journal in America, and enjoys a larger circulation among the more intelligent operators and workers in the gold fields of the world.

Established in 1860, it has firmly maintained its position as a reliable, progressive journal. The information given in its columns has saved millions of dollars to the practical miners, metallurgists, mill men, mine and shareholders on the Western side of our continent.

Among its contributors are the ablest and most experienced mining engineers, superintendents and practical miners in this country.

The PRESS gives a condensed summary of Mining News from the most important mining districts of the country.

New processes and methods of mining are described in its weekly issues. New mining machinery and improvements are frequently illustrated and explained in a manner to be of great value to all interested in mining.

As a scientific and mechanical representative of the Pacific coast it is decidedly popular, and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivalled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer, will find profit by its reading.

Subscription, $4 a year in advance. Sample copies, postpaid, 10 cents.

California Brass Foundry,

No. 125 First Street, Opposite Minna.
SAN FRANCISCO, CAL.

All kinds of Brass, Composition, Zinc, and Babbitt Metal Castings, Brass Ship Work of all kinds, Spikes, Sheathing Nails, Rudder Braces, Hinges, Ship and Steamboat Bells and Gongs of superior tone. All kinds of Cocks and Valves, Hydraulic Pipes and Nozzles, and Hose Couplings and Connections of all sizes and patterns, furnished with dispatch. PRICES MODERATE.
J. H. WEED. V. KINGWELL.

California Machine Works,
WM. H. BIRCH, Prop'r.
119 Beale Street, San Francisco.

General Mechanical Engineer and Machinist. Steam Engines, Flour, Quartz and Mining Machinery. Sole manufacturer of Brodie's Patent Rock Crushers and Steel-Faced Tappits. Agent and Manufacturer of F. A. Youse's Patent Steam Packing Rings for Steam Pistons. The best ever invented; can be applied to any Engine Piston and give entire satisfaction to those using. Steam, Hydraulic and Sidewalk Elevators. Repairing promptly attended to.

STEAM ENGINES AND BOILERS

Of all sizes—from 2 to 60-Horse power. Also, Quartz Mills, Mining Pumps, Hoisting Machinery, Shafting, Iron Tanks, etc. For sale at the lowest prices by
J. HENDY, 49 and 51 Fremont Street, S. F.

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

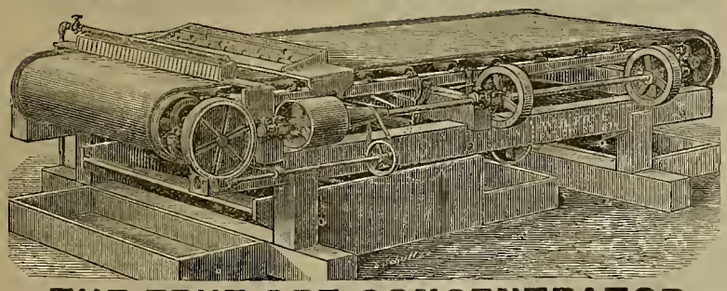
Office, No. 230 California Street - - San Francisco, Cal.

$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR.

Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.

Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.

We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.

☞A machine with all improvements can be seen in working order and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont street.

SAN FRANCISCO, SATURDAY, FEBRUARY 11, 1882.

VOLUME XLIV Number 6.

Portable Ore Furnace and Reducer.

The engraving herswith ropresents an apparatns for ths pnrpose of redncing mstalliferous ore. It may be made sithsr stationary or portahls, and of any rsquired oapacity. It admits of modification or variation in its form without dsparting from ths ssential principlss of constrnction nccessary to prodnce the required rsnlts.

The designsr is James Bujac, of Catonsvills, Baltimore connty, Maryland. Tbe form shown in the engraving is a portahls redncer. This consists essentially of an ontside csse mads of hoilsr iron, properly put together; an enclosed ore cylinder, furnishsd at its nppsr end with a feed door and hopper, and a safsty valvs for the exit of vapors, and at its lower end with a discharge door, a retort for ths distillation of hydrocarhons, a pips for conducting the vapors arising from the hydrocarhons to ths cylindsr, and suitahls furnaces for heating the ore cylinder and rstort. The figure is a vertical section of the portahle reducsr.

A rsprssents ths ore cylindsr placed in the cnntsr of the cass at the proper angls of inclination, so as to admit of its heing charged and discharged at will, and provided at its nppsr end with a feed door or slide, *C*, surmounted hy a boppsr, *B*, for the reception of ores. Its lower extremity is fitted with a hinged discharge door, *a*. It is also provided with a safety valve, *D*, to allow the escape of the vapors, which otherwise would accnmulate in its interior, and also to prevent the ingress of atmospheric air. When the slide, *C*, and door, *a*, are closed, the cylinder forms an air-tight or closed compartment for the treatment of ores.

Beneath the cylinder is a fire-hox, *H*, fnrnished with a grate, *I*, ash-pit, door, damper, etc. The prodncts of comhustion arising from the fire, heing deflected hy the flne hoard, *F*, are made to pass through the center or return flues, *E E E*, over the top of the cyllnder, *A*, and escape through the stack, *G*.

The semi-cylindrical retort, *K*, is nnder the cylinder, *A*, and is closed hy a hinged door, *P*, for the introduction and removal of the suhstances snhjected to distillation. This retort, *K*, ie also provided with a fire-hox, or furnace, *M*, and return flue, from which the prodncts arising from the comhustion of the fuel are made to pass into the flne, *E*, of the cylinder, *A*, and thence into the stack, *G*, as common to both.

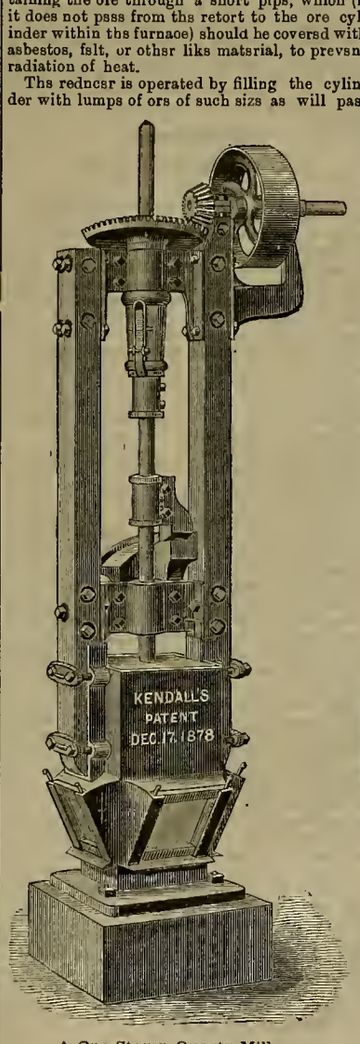
The retort, *K*, is connected to the cylinder, *A*, hy a pipe, *S*, taking the vapors from the retort at *L*, and delivering them within the ore-cylinder at *R*. This pipe, *S*, is also fitted with a valve, *T*, to regulate the passage of the vapors arising from the distillation to pass into the ore-cylinder, *A*, and also a valve, *U*, through which the vapors may he allowed to pass or escape into the air at will. The pipe, *S*, is covered with ashestos.

The cylindsr, *A*, heing filled with ore is heated to the proper temperature, and this temperature varies with the ores to hs treated. The vapors (the whole product), arising from the decomposition or destructive distillation of the hydrocarhons placed in the retort, *K*, having heen suhjected to a high temperature, are caneed, while thus hot and in a nascent state, to pass directly from the retort, *K*, in which they are generated, through the pipe, *S*, into the ore cylinder, *A*, which is filled with ore at the proper temperature, and from which atmospheric influences are excluded. By this means the metallic compounds are quickly reduced to the metallic state without heing melted. The matrix gangue and earthy suhstances are entirely redneed to powder, or rendered so friahle that their disintegration is easily effectsd hy any ordinary or inexpensive crusher.

The inventor, in his specification, statss that this invention may he carried into effect hy the apparatus herein described, either stationary or portahle, or hy any modification of it which will operate on the same principle to apply the products arising from the distillation of hydrocarhons in their crude state and highly heatsd, which condition he says he has found to he essential for the disintegration of quartz rock hy the agency of hydrocarhon gases.

It is ohvious that ths most convsnisnt mode of applying thess products, crude and heatsd, is to convsy them dirsctly and immsdiatsly from the gensrating rstort to the cylindsr containing the ore through a short pips, whioh (if it does not psss from ths retort to the ore cylinder within ths furnace) should he coversd with asbestos, fslt, or othsr liks matsrial, to prevsnt radiation of heat.

Ths redncsr is operated by filling the cylinder with lumps of ors of such sizs as will pass



A One-Stamp Quartz Mill.

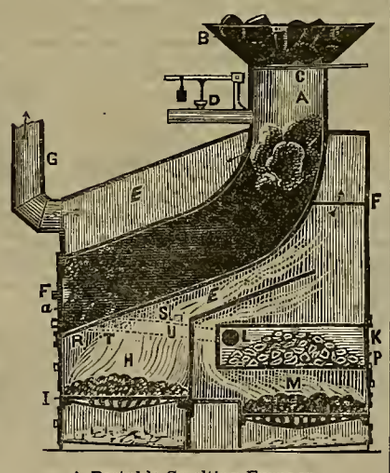
into the cylinder through the slide door into the hottom of the hopper. All the apertures hsing closed, this cylinder forme an air-tight compartment. The retort, heing charged with the hydrocarhon, is then heated to a high temperature hy means of its furnace, and the vapore evolved or arising from the distillation are caused imine-diately at the moment of their generation, and at the high temperature required to liberate them (hence acquired and possessed hy them in this incipient and newly-horn condition), to pass immediately from the retort into the ore cylinder, expelling the atmospheric air, which passee out through the automatic escape valve.

The fire heing now lighted in the furnace of the ore cylinder and the ore heated to the propsr temperature (which temperature varies with the nature of the ore to he treated), and the valve on the connecting pipe heing so adjusted as to allow the hydrocarhon vapors from the retort to pass into the cylinder in such quantities as will produce an interior prssure on the valve snfiicient to overcome the exterior resistance, thus raising the valve and allowing and insuring the expulsion of the vapore formed, a continuous flow of the hydrocarhon vapors through the ore cylinder is maintained, keeping the heated oree in contact and surrounded with a moving current or atmosphere of the hot or newly-generated vapors arising from the distillation of the hydrocarhon going on in ths rstort, and direotly and immediately passing from the said rstort into ths ore cylindsr, without detsntion or detsrioration. By this processs, the mstslliferons compounds are reduced to ths metallic state, and ths earthy or rocky matrix is reduced to powdsr, or rendsred so friahle as to nssd hut a slight or inexpensive orushsr for its furthsr reduction.

In describing this furnace and its opsration, we have nssd the language of the invsntor in his patsnt spscification. Tbe patsnt covsrs, in an apparatns for reducing orss, the comhination of a hydrocarhon rstort and an inclinsd ors cylinder having ths close feed door and a safsty valvs at its uppsr end and a discharge door at its lowsr end, and a snitable connection hetween said retort and the cylinder.

The New Sugar Refinery.

In Sprecksls' nsw sugar refinsry the large main huilding is 10 stories high in parts and 12 in others. Seven millions and a half of hricks wers used in its construction. Thers are, in fact, thres huildings—the rsfinery proper, ths char house, 12 floors high and 86 ft. wide, and the boilsr house 187x80 ft., all three having 400 ft. watsr frontags, and all the stories having douhls floors for strength and durahility, while the hassment, intended for machinery and pumps, is of concrete. From the second floor goods will he delivered into railroad cars. The third floor will he used for packing sugar, the fourth for cen-



A Portable Smelting Furnace.

trifugal machinery. The fifth floor will he nsed for mixing sngar for the centrifugal machines, and the sixth and seventh stories for various other purposee, while on the eighth floor will he the vacuum pan for condensing syrup, 43 ft. high, and reaching to the 12th floor. The walls of the refinery are three ft. thick at the hase and taper to 16 inches at the top. A warehouse will be huilt hy the side of the refinery, in which will hs pans for melting sugar, which will be pumped to the summit of the huilding, whence it descends in a liquid state through sorens and filters. The filter-house is 12 floors in the rear and ten in front. The hoiler-room is 187x80 ft., and contains 22 hoilere and space for 22 more. There is a main smoke-culvert rear of the hoiler-house for receiving gas from the hoilers, the gas to he utilized ae an economizsr for wood. The chimney is 27 ft. square at the hase and 168 ft. high. The machine shop, for holding and repairing the machinery and implements of the establishment, is 80x40 ft. Work was hegun last May and will he finished next Septemher. When completed, the whole building, machinery and fittings will have cost over $1,500,000.

THE track of the Southern Pacific is laid 204 miles east of El Paso.

Foundry Notes.

The Ætna Iron Works, Fremont strest, are vsry husy just now on a lot of miscsllaneous and small work; in fact, husisr than for some months, although the work comprises no large, special single johs. Among other things they are making a large quantity of artesian well tools to go to Texas for ths Southsrn Pacific R. R. Co. Thess consist of hits, angers, sand pumps, etc., for an sight-inch well. They ars also huilding a 12x24 Msysrs' cut-off engins, and doing considerahle city work.

Among othsr things on which tbey ars engaged is a lot of sxhaust piping for the new sugar rsfinery of Claus Spreckels. This is oast iron pips of 20 inches in diameter. The iron work for this rsfinsry has besn divided up mors or less among the locsl foundriss, and the Ætna has had its share among the othsrs.

Some of the ironwork for this refinsry was huilt in ths East, hut a good deal has heen done hy the fonndries here.

The Ætna Iron Works have recently taken in hand ths manufacture of the Ksndall one-stamp mill. Although ws havs hefors pnhlished the engraving, ws reproduce it hsre, as it has now hesn proved successful, quits a numhsr being in uss, and is now to hs more sxtensively introdncsd. There are threes of thsse mills in Arizona, two in Nsvada county Cal., three in Amador county, two in Tuolumne connty, several in thie city and in many mining camps in this State, Nevada, Montana, Idaho, Britieh Colnmhia and Arizona, mainly for working gold ores. Ahont three yeare ago the New York & Hondnras Rosaria mining company, of Honduras, S. A., ordered a No. 1 Kendall mill, and after working it for one year, ordered three more; and in Octohsr, 1881, seven more—making in all 11 mills now in opeiation on thie mine, which spsaks weil for the estimation in which it is held.

Kendall'e improvement is radical, and conеists in the ingenious and novel construction of the cam, and also in a peculiarly shaped tappet which is secured to the stem of the etamp, so as to revolve with it at the same time that it is lifted. The cam is a plain curved incline, mounted on a ruhher cushion to prevent jarring. The stamp is raised by the tappet rising on the curved cam, and as it drops off the cam a grinding opsration is produced hy the rotation of the stamp until it is again lifted. Thie ingenioue arrangement gives both a crushing and a grinding action to the etamp—an invaluahle comhination for working gold ores.

The mortar is constructed for one stamp only; hnt there are three discharge openings fitted with screens, and the discharge is fully squal to the utmost work of the stamp. The Kendall stamp is similar to the old stamp, with the exception that it is operated hy different devices, and has the very important grinding action which we bave specified. Mr. Kendall claims that this stamp is capahle of doing from two to six times the work of the old stamp, hesidee doing work which the old stamp cannot do.

The Kendall mili is complete, and ready for instant shipment. Mills of one and three tons capacity are made in sections, and may he packed on mules. It may he used as a prospsct mill; and as the mine is developed, one stamp at a time may he added. When the Kendall mill leaves the machine shop, it is hnilt and finished, and ready to set upon a hlock, receive the helt, and hegin at once to reduce ore. One of the main iteme in the cheapness of the Kendall mill is the small cost of its transportation. For prospecting a mine, any miner can see its usefulness.

THE following miningpay-rolls for January: work have been reported: Con. Virginia, California and C. & C. shaft, $15,114; Union shaft, $12,412.50; Forman shaft, $9,128.-82; Overman, $7,546.25; Union Con., $15,465.50; Ophir and Mexican, $14,975.50; Yellow Jacket, $14,570; Sierra Nevada, $11,-453.50; Combination Shaft, $7,231.87; Hale & Norcross, $6,805.50; Gould & Curry and Best & Belchsr shaft, $10,002; Savage, $1,415; Utah $5,955.75.

CORRESPONDENCE.

Eads' Ship Railway.

Editors Press:—Who believes in the practicability of the inter-oceanic ship railway? I have answered this question in private until I am tired of it. I wish it distinctly understood, that my only interest in this matter is a scientific and professional one. The financial and commercial merits of the scheme I have neither time nor inclination to investigate.

As a partial, public and final answer to the question, I think I can say: All engineers who have taken the trouble to investigate the subject. I think it is true, also, that all engineers who have not examined it are doubtful of its feasibility. But engineers are not in the habit of expressing a professional opinion without investigation; and so far as I can discover, all engineers who have written upon the subject, have pronounced the scheme entirely feasible from an engineering standpoint.

As a matter of scientific and engineering interest, I have compiled the following authorities, who have carefully examined and endorsed the scheme. If there are engineering authorities on the other side, I am singularly unfortunate in not being able to find them:

1. Capt. Jas. B. Eads—An engineer who has never been known to fail in any of his great undertakings.

2. Nathaniel Barnaby—Present chief constructor of the British Navy.

3. Wm. John—Late scientific adviser of the committee of Lloyd's Register of British Shipping, and now Manager-in-chief of the Barrow Shipbuilding Co., builders of the steam-liner *City of Rome*.

4. George Foshury Lyster—Designer and constructor of the Alexandra docks, one of the wonders of the world; for 20 years Engineer-in-chief of the Liverpool docks.

5. John Fowler—Past President of the Institution of Civil Engineers; late Consulting Engineer of the Egyptian government; Engineer-in-chief of the Metropolitan (underground) railway of London; now constructing by far the largest bridge in the world, and recognized as one of the ablest and most experienced of living engineers.

6. E. Leader Williams—Member of Institution of Civil Engineers. He was Engineer-in chief of the Trent and Mersey canal; originator of the Anderton lift, by which a section of about 150 ft. of canal with vessel, is raised or lowered 50 ft. to make the transit from the River Weaver to the canal, or from the canal to the river. This lift has been in constant and successful operation, without any hitch, for more than seven years. The French government is now building a much larger one, and the Belgium government four still larger, on the same principle.

7. Lionel B. Wells—M. Inst. of C. E. and present Engineer-in-charge of the Anderton lift.

8. Sidenham Duer, London—A distinguished civil engineer.

9. Clark & Stanfield, London—Civil engineers who have had successful and extensive experience in lifting and handling ships.

10. Emmerson, Murgatroyd & Co.—Contracting engineers, constructors of the Anderton lift, and the hydraulic docks at Malta and Bombay.

11. W. Pierce, Esq.—Sole proprietor of John Elder & Co.'s works, Govan, Glasgow, Scotland, where many of the largest and finest steamships in the world have been constructed.

12. B. Baker—Partner of John Fowler, and one of the ablest engineers in London.

13. Francis Edgar—Fellow of the Royal School of Naval Architecture, late general manager of Earle's ship-building and engineering company, a naval architect of recognized ability.

14. Don Francisco de Garay—Who, in recognition of his eminent abilities as an engineer, has been made a member of the Legion of Honor by the French Government. He is at present engineer of the Valley of Mexico, and was sent by the Mexican Government to the Canal Convention at Paris, in 1879.

15. Wm. Sooy Smith—An American engineer and inventor of great experience and ability. He designed and constructed some of the most important railroads and bridges in the United States, and is now in charge of the tunnel under the Hudson river, it having been placed in his charge after the frightful accident at that work in 1880.

16. Edward Hartt—United States Naval Constructor—one of the oldest and ablest in the navy.

17. H. L. Fernald—Another United States Naval Constructor, of recognized talent and ability.

18. Q. A. Gilmore—Lieutenant Colonel Engineers; Brevet Major-General; President of the Mississippi River Commission, and author of numerous engineering and scientific work, an engineer of world-wide renown.

19. Henry Flad—A distinguished civil engineer and President of Public Works in St. Louis.

20. O. Chanute—An experienced and accomplished civil engineer, Superintendent of the Erie railway.

21. Commodore R. W. Shufeldt, U. S. N.—The accomplished officer who surveyed the Isthmus of Tehuantepec.

22. Colonel C. Shaber Smith—A well-known and able civil engineer.

23. B. H. Harrad—Member of the Mississippi River Commission, formerly State Engineer of Louisiana, an engineer of acknowledged ability.

24. General G. T. Beauregard—Formerly a member of the U. S. Corps of Engineers.

25. E. L. Corthell—Engineer of the bridge across the Mississippi at Louisiana; and of the Soy Island Improvement Works; and resident engineer at the jetties until their completion.

26. H. D. Whitcomb—Civil Engineer, in charge of the improvement of James river. He was sent to Europe by the U. S. Government to study the improvements at the months of rivers there, and to report upon the jetty system.

27. Chas. R. Suter—Major of Engineers, U. S. A., the able and accomplished engineer in charge of the improvement of the Missouri river.

28. A. Dempster—City Engineer of Pittsburg, an engineer of extensive practical experience.

29. Max. E. Schmidt, C. E, member of the American Society of Civil Engineers; for several years resident engineer at the jetties; afterwards in charge of important improvements on the upper Mississippi, and now engaged in the construction of one of the Mexican railways—an engineer of acknowledged ability and standing.

30. E. A. Fuertes—Dean of the Department of Civil Engineering, Cornell University; and chief engineer of Commodore Shufeldt's surveying expedition in 1872.

31. Capt. Silas Bent—Formerly of the U. S. N.; a gentleman who has devoted much study to the winds and currents of the ocean; the region of calms in the Carribbean sea and in the Pacific ocean.

32. Sir Edward J. Reed, K. C. B., M. P.—Sir Edward Reed is a member of Parliament, and was for many years chief constructor of the British navy. He was made a Knight Commander of the Bath in recognition of his eminent abilities as a naval architect. He is a Fellow of the Royal Society; member of the Institution of Civil Engineers, and of Mechanical Engineers; Vice-President of the Institution of Naval Architects; member of the Liverpool Literary and Philosophical Society; author of "Ship-Building in Iron and Steel;" "Our Iron-clad Ships," and many other able engineering papers; for a long time editor of *Naval Science*; and unquestionably the highest authority in the world on this subject. Many other eminent names could be given but the foregoing are sufficient to show the highest engineering authorities in the world are outspoken in its favor.

There may be no lack of good reasons why the ship railway should not be constructed, but difficulty in safely taking ships with their cargoes from the water, transporting them by rail across the Isthmus, and launching them once more upon the ocean, is not one of them, as anyone moderately versed in mathematical and mechanical science can readily demonstrate; and the weight of opinions and the force of possibly legitimate arguments against the scheme are diminished, if not entirely destroyed, when coupled by their authors with an objection, showing either want of principle or gross ignorance of the question under discussion.

A. B. Bowers, C. E.

Smelting Ores in Inyo County.

Editors Press:—The building of the Carson and Colorado railroad through Owens' River valley sometime during the present year, will open up one of the finest opportunities for the investment of capital in smelting works for the reduction of silver lead ores to be found on the Pacific coast.

The Inyo range, from Cerro Gordo north, for a distance of 80 miles or more, contains hundreds of mining claims, and a large proportion of them show smelting ores of high grade. These ores consist of carbonates, oxides and sulphides of lead. The general formation in which these ores are found is limestone and slate. The richest ores are found in the slate, and some of them from the Swansea district, near Owens' lake, run as high as 500 ozs. of silver per ton on an average, and 40% of lead.

The ores in the limestone on the western slope of the Inyos will average from 60 to 70 ozs. of silver per ton, and 50% of lead. Most all of these ores carry gold varying in quantity from $5 to $15 per ton. Quite a large number of these claims are opened by shafts or otherwise, varying in depth from 20 to 100 ft. or more, and with from 10 to 30 tons of ore on their dumps. Some of them show first-class prospects for ore, and the best indications for large and valuable bodies.

The owners of these mines are generally poor prospectors who have held on to their claims for years in hopes that something would turn up for their benefit.

The great obstacle to working these mines has been the expense of transporting the base bullion to market, together with the cost of getting in mining supplies. The distance from Independence to the nearest shipping point on the Southern Pacific railroad is about 150 miles. The building of the Colorado & Carson road through the valley and along the very base of the Inyo range will bring most of these mines within from 3 to 10 miles of the road. The facilities for smelting these ores are almost unequaled. Wood by the million cords can be had in the Inyos at a cost of about $6 per cord delivered at a furnace, and charcoal of first quality for 15 to 18 cents per bushel. Hay, grain and general produce is raised in abundance in the valley and is sold at very reasonable prices. The Owens' river, carrying a large body of water, runs down the valley within a mile or two of the base of the Inyo mountains, furnishing an unlimited water power for driving mills and furnaces. The climate is everything that could be desired in both summer and winter. Snow never falls on the Inyos to interfere with every day work. Of course we know that it is not every mine that will furnish enough ore to run a furnace or mill, but by building large smelting works at some central point on the railroad, the ore from the different districts could be brought to a furnace at small cost and reduced.

Seven different mining districts all adjoining and along the line of this road, would furnish ores for such works. The districts (following from south to north), are Cerro Gordo, Swansea, Beveridge, Russ, Union, Deep Spring and Bishop Creek. These districts are all rich in ores of both a smelting and milling character. The ores can be purchased of the owners of the mines at fair prices, thus affording the means to develop the mines, and at the same time they can be bought at such figures as to leave a large profit to the smelter. Another advantage to be gained by erecting a smelter at a central point and buying ores, would be the bringing together of a variety of ores of different compositions, thus enabling the smelter to make combinations that would flux easily and smoothly, and save a higher percentage of the valuable metals than could be done with ore from any single mine. Such works would no doubt prove a first-class investment if skillfully and economically conducted. W.

Limiting Issues of Passes.

At a meeting in Chicago, Jan. 12, the following agreement was adopted by the railroad companies whose names are mentioned therein:

"The following agreement was this day made by and between the Chicago & Alton; Chicago, Burlington & Quincy; Chicago & Northwestern; Chicago, Rock Island & Pacific; Hannibal & St. Joseph; Missouri Pacific, and Wabash, St. Louis & Pacific railroad companies:

"1. That the issue of free passes by the parties hereto to merchants in the city of Chicago or merchants in the city of St. Louis, to be forwarded by them to their country customers, shall be entirely discontinued, and no passes shall hereafter be issued in that way.

"2. That the parties hereto shall withdraw their books of passes from Missouri river and other points, and entirely discontinue the practice of allowing their general agents to furnish free passes to merchants, not only at Missouri river points, but at all points East and West.

"The object of this agreement is to entirely discontinue the former practice of giving passes to merchants residing at any point on the various lines, or to their traveling men, it being understood that each road, through its President, Vice-President, or General Manager, may exercise its own judgment with referens to furnishing free transportation to promote local interests on its own line."

The same roads have entered into an agreement concerning passes and advertising tickets for editors and publishers, not to issue any kind of transferable tickets on account of advertising, and not to issue annual or season passes in payment for advertising to any but persons exclusively engaged on newspapers, and not in any other business. These tickets or passes are to be kept in one office or department only of each road. The last clause of the agreement is:

"Nothing contained herein shall be construed to prevent the issuance of strictly complimentary, non-transferable passes to any editor or publisher who may be actually engaged in editing or publishing any newspaper or other publication; but in such cases no notice, advertisement or other publication shall be asked for or accepted in return for said passes. They are to be fully and entirely complimentary in every sense implied by the word."

Marvelous Mining Work.—The length of the shafts and galleries in the Comstock mines of Nevada is 250 miles. During the 20 years just closed 350,000,000 tons of waste rock have been hoisted, 1,750,000,000 tons of water pumped to the surface, and the net result of all this work was $325,000,000 in bullion. We must wait until the 20th century to ascertain if the Comstock's equal has been discovered and is numbered among the mines of to-day. Whether or not such stupendous results could have been, or can be, attained by companies with non-assessable stock, will probably remain an unsolved problem.

Mining in the vicinity of the lava beds at Oroville, is being carried on to a much greater extent this winter than for a number of years past. The ground has to be stripped to a depth of from 5 to 15 ft., and usually these holes are so full of water that the Chinamen are forced to leave them. This winter the case is different, for, there being but little rain, they are not molested, and are taking out a large amount of gold-dust.

The yield of the Richmond company, Eureka, Nev., in Dore bars of silver for the year 1881, was $1,172,000. This does not include the lead turned out at the company's refinery.

Smelting Lead Ores with Gas.

The heavy expense for fuel incurred in smelting lead ores in our Western mining districts appears to be attracting the attention of inventors, and the local press, especially of Leadville, has brought out several articles relating to the use of gas obtained from cheaper local bituminous coals in place of charcoal or coke. The articles referred to set forth in an elaborate way the theoretical advantages of such a method, which no one will be prepared to dispute. The idea is by no means a new one; but numerous practical difficulties, which will readily suggest themselves to those who have had experience in such matters, have, so far as we know, prevented the execution of such plans. Possibly the best form of furnace for the working of ores with gas as fuel would be the Siemens rotator, which we had occasion to describe some time since; and probably water-gas, besides being cheap, would at the same time act as a sufficiently strong reducing agent. We have not heard that the methods proposed in Leadville have been put to any practical test, which alone can convincingly settle their feasibility; but it may not be without interest to put a brief description of them on record.

Mr. A. Stamm manufactures gas from bituminous coal, either in retorts of fire-clay or in generators of fire-brick. In either case, the tarry vapors which arise during the first hour's distillation of the coal are injected into a regenerating retort or chamber filled with incandescent coke. To accomplish this, a portion of the gas is strongly compressed in a cylinder, and the compressed gas made to issue through a nozzle in the form of a forcible jet, just where the pipe that contains the tarry vapors enters the regenerating retort or chamber. The jet of compressed gas thereby injects the tarry vapors into the glowing coke, and forces them through it. The tarry vapors are, by the contact with the latter, converted into fixed, but somewhat light, hydro-carbon gas. It differs from water-gas, inasmuch as it contains comparatively little carbonic oxide and free hydrogen, and only a minimum amount of carbonic acid. The gas thus manufactured is used with the coke for smelting.

Whatever the future of Mr. Stamm's untried gas process may be, he is sure of disappointment in his efforts at "saving fumes," and it is not likely that any one will dispute his claims to originality on that invention. In a pamphlet issued by the Stamm Smelting Co. (which is fortunate in having assigned to it the exclusive right to use this invention within the State of Colorado), we are informed that "the volatilized lead and silver, together with unburnt carbon in the form of smoke, ascend the shaft. Opposite the charging-hole there is a long, wide opening into the wall of the furnace. From this opening a large pipe goes downward to the level of what appear to be the hoshes of the furnace. Then the pipe turns inward and reaches in a horizontal direction to the inner wall of the water-jacket. At the end, it is met by a jet of compressed gas through a tuyere, thus injecting the fumes into the lower part of the furnace.

"This gas-jet must be strong enough to draw down the solid fumes (volatilized metals and carbon) and to blow them into the furnace. The gases escape through an opening in the fume-pipe half-way between the upper part of the furnace and the injecting tuyere. In this manner, the fumes and volatilized metals are returned into the furnace at the proper place, without labor, and while hot; and there is no waste of fuel in smelting them a second time."

This is the first time we remember having heard the startling theory advanced of separating fumes from gases of combustion by the ingenious method of producing a special outlet for the latter! It presupposes an intelligent discrimination, a sort of instinct, on the part of the gases of combustion which no one has ever given them credit for thus far. Mr. Stamm's idea of blowing the fumes back into the furnace, after his ingenious separation, of course, but in order to save fuel in smelting them over, requires no comment. This departure from existing notions in the metallurgy of lead is too sudden not to take away the breath of critics.—*Engineering and Mining Journal.*

It is with regret, but without surprise, says the Globe (A. T.) *Chronicle*, that we have to announce the stoppage of work on the Stonewall Jackson mine and mill at McMillan. It is believed by all who know anything of the mine, that with intelligence, it would have been paying dividends long since. A large amount of very fine ore, much of it as beautiful native silver as has ever been taken from the earth, has for several years supported a considerable mining town and population; but the stockholders have received no benefit, so far as heard from by small owners of stock.

The Idaho *Avalanche* reviews the business of Owyhee for 1881. The product of the mines of the county, with not more than 100 men constantly at work, was about $300 000. There were assessed 26,383 cattle, 11,125 sheep and 2,619 horses and mules. Total value of property, $650,259.

There is a 20-stamp mill to be built at Queen creek, about 15 miles from the Silver King mine, A. T. J. B. White, who built the Hermosa mill at Harshaw, is the contractor, and is under agreement to have the mill in running order by the first of May.

Mechanical Progress.

Mechanical and Educational Co-relation.

There is a certaio co-relation of mechanical needs, and mechaoical skill and appliances, that makes it at timea difficnlt to determine which is entitled to the credit for advaoces made in any specific direction. Chordal'a miller, who reqnired a better proof staff, had a good deal to do with edocating Chordal up to the making of ooa that wonld answer the requirements; while, on the other hand, the fact that the skill to make aomethiog nearly perfect existed, undouhtedly had quite as much to do with the miller'a demand. Neither may have had much interest, or at least more than a selfish interest in supplying the waots of the one or advancing the other in the way of skill; notwithstanding, which the relation hetween something hetter wanted and the latent ability to produce it hrought ahout hetter results, hoth in the direction of milliog, and the mannfacture of milling tools.

This is only one illnstration of the interworking of thiogs not particularly relatcd, to hring ahout results common to hoth. It is interesting to note this co-relation in its influence on the great mannfaotoriog interests of the country. The huilders of steam engines, or of machine tools, or, io fact, of any kind of machines or machioery, are supplying refined prodncts hecanse they aro called for, and they a.e called for hecaoee the skill to produce them exists or will he forthooming. There is a sympathy hetween the want and the filling of it that is imperfectly accounted for hy the law of supply and demaod.

It might at first thonght seem improhahle that there was any relation hetween the character of the products of a cotton mill, in Lowell, for instance, and the mannfactnre of standard gsuges and measuring instruments of perfection in Providence or Wilmington; hnt the fact is, the progress of the one is intimately associated with that of the other. This relation may not he altogether clearly defined, but it exists none the less, hecause it cannot he so readily traced or defined. The fact that such gauges and such instrnments can he made, has much to do with the mechanical system and order and perfection of the mill, and that system and order and perfection make it possihle to improve the qnality of the productions, and to manufaoture so cheaply as to insnre a demand. In retnrn, the want of snch a system has quite as much to do with the production of the tools and mechanical refinements which render it possihle. In this way the desire of some one who don't know what a standard gauge is like has an infloence in determining their production, while those who think they have no interest in the manufacture of cotton exert a good deal of influence in the institution, the improvements and the refinements of that husiness.

The estahlishment of one indnstry leads to the estahlishment, not only of others of the same kind, hnt to those so entirely different, that it is difficult to trace a possihle connection hetween them. It may also he seen, that, as the estahlishment of the one assists the others in gaining a foothold, so the progress toward perfection of either lifts the others upward and in the same direction.

While, as has heen said, these effects result where there is no apparent connection, and even where there might he supposed to he an actnal antagonism, it is nevertheless certain that there mnst he a real cause, withont which there is no effect.

It is coming to he hetter nnderstood that this cause is knowledge; not exactly special, or in a specific direction, hut a general fund toward which all contrihute, and from which all may draw. It is noticeahle, in this connection, how the appreciation of this fact hreaks down the harriers of trade secrets, and determines all to contribute to the general fund. Thus it is that the memhers of an intelligent community mutually help each other, and help along the general and special hosinsss prospects. A more perfect understanding of mechanical and edncational co-relation will roh husiness pursuits of the exceptional part of their selfishness, hecause it shows conclusively, that knowledge and education in an entire community tend to advance any single individnal memher.

It is one of the healthiest signs of the times that it is getting to he conceded that the proper advancement of even a special interest depends largely upon the general intelligence of all, and that, even in a purely selfish view, the hest use to make of knowledge is to spread it ae much as possihle.—*American Machinist.*

A New File should always he used with a light pressure until the very thin sharp edges are worn off, after which a heavier pressure may he used with much less danger of the teeth crumhling at the top or hreaking off at the hase. Every filer ehould keep a partially-worn file to use first on chilled surfaces or gritty skin of castings, or on a weld where horax or eimilar finxes have been employed, or on the glazed eurfaces of saws after gumming.

A New Indicator.—A Madgeburg inventor hse secured a patent upon an indicator with duplicate pistons, sprigs and cylinders, which is connected to hoth ends of the cylinder, so ae to produce a figure that ehall show the amount of work done in a oomplete douhle stroke.

New Mode of Laying Floors Suggested.

A snggestion has heen made to a contemporary of hnilding warehonse floors on the same principle as are ships' decks, so that in the event of a fire in the upper stories the damage which now necessarily ensues, hy resson of the deluge of water applied, may he obviated; in other words, let the floors of warehouses he calked, so that they shall be perfectly watertight, and whether water should be spilt hy accident, or hy design, as in the case of fire, no damage to the goods stored heneath should he done. The first thooght which occurs to one is that in the event of a hose heiog tnrned on to a warehouse upper story, the water fioding no outlet would flood the room to any depth, hut the correspondent we have referred to has forestalled this casualty hy suggesting the provision of a gutter ronod esch room communicating with pipes pierceing the walls and carryiog away the water as a rain-water pipo now does. No donht were this plan carried into effect, the first cost of erection wonld ho somewhat increased, but to the person intending to use any particular warehonse for the storage of valuahle and perishsble property, it is well worthy of coosideration whether it would not in the end "pay" to adopt the plsn, in prefereoce to having a whole chsmher full of property damaged or spoiled by the supply of water to a fire occurring in an npper room.

A Valuable Process.—A process for coating of all kinds of metals and their alloys with thin films of copper has, says *Engineering*, heen perfected by M. F. Weil, who recently exhihited several specimens of his craft at the French Academy of Sciences. The coating is done instantaneously hy a siogle copper hath at the ordinary temperature. The adherent film, which is formed of suh-oxides of copper, is often of the most heautiful colors. Steel, hrass or precious metals can thus he covered with a film of any required tint at the will of the operator, and the variety of tints is that displayed hy the phenomenon known as the "colors of thin plates." Either a single color or all the hnes of iridescence can he produced from the same hath, according to the way in which the pieces are exposed to the electric action. These colors are not, however, due to the well-known effect of thin plates, hut to the suh-oxides of copper, and the inventor supports this opinion of his hy the experimental fact that a piece of any metal whatever polychromized hy his process is immediately covered with a layer of pure copper of the richest red when treated with nascent hydrogen.

An Expanding Mandrel.—An expandiog mandrel recently introduced, consists of two parts, viz.: A rihhed split sleeve and the mandrel proper. The sleeve, which is made of steel, is pierced with a tapering hole, and one end of the mandrel is turned to exactly fit this hole. The sleeve is then turned to the reqnired diameter, preferahly on the maodrel to which it helongs, after which the material is removed in snch a way as to leave three narrow loogitudinal hearings, with equal depressed spaces hetween them. These depressions extend very nearly to the hore of the sleeve, leaving only sufficient metal to hold the hearings in position. The sleeve is cut apart through one of these depressioos, leaving it free to contract or expand. In using this mandrel, the sleeve is placed in the hole, where, hy lightly driving the mandrel into it, expansion will occnr, and tho three hearing snrfaces will he forced into sufficient contact. The contrivance is simple in construction, can he readily and inexpensively made as required for nse in a machine shop, and can also he advantageously manufactured aud sold as a standard tool.

Fires Under Boilers.—Some one has asked a cotemporry—"When a hoiler is short of water and a heavy fire is on the grate, what shall he done to prevent the hoiler from heing hurned?" An answer is given as follows: The first impulse is, on the part of some, to haul the fire at once, hut is not that the most dangerous course that could he taken? It seems open to criticism. A fire that ie disturhed, is intensely hot for a short time, at a period when no more heat is needed, and it would, therefore, seem that it would he hetter to open the doors and throw wet ashes on and smother the fire, instead of adding to the danger hy raking it over. By so doing, the heat is at once lessened —at no time increased—and the pressure is falling, hut when we haul a fire, the exact reverse occurs, more steam is made, and the danger increased. We think it is safer to cover the firee than to haul them, particularly if they are hituminous coal.

To Detect a Fault in Iron.—If a piece of iron appears to have an unsound weld, or if it has a crack apparent upon ite surface, and it is desired to know how deep it penetrates, heat the part to he teeted to a red heat and pour a fine stream of water on the faulty spot, hut mainly on one side of it, and the iron on that side will lose its redness more rapidly than the other side, and plainly indicate how deeply the defect extends.

It is said that the Bonanza King, Senator Jamee G. Fair, of San Francisco, has pnrchased the old "Whitehall" mine, in Spottsylvania county, Virginia, payiog over $100,000 for it. This mine is the continuation of the central vein of the Rappahannock mine, and the intention is to eink a shaft immediately to the depth of 500 ft., and ereot a large stamp mill.

Scientific Progress.

Facts about the Eye.

The eye is preserved in the convenient form of a sphore, or hall, hy the simple dovice of having its interior cavity filled with liquid, which prevents the limp and otherwise flexihle coats from puckering np into aoy irregularity of shspe. It is like a hladder distended with water, which is firm and tense on nccont of the contained liquid so shnt in hy the memhraneous wall that it cannot possihly escspe anywhere from the tight grasp in which it is held. Thero aro, however, in the interior of the eye two distinct chamhers in which the liquid is distrihuted, one in front of and one hehind the crystalline leos. The lens hangs, as it were, in the midst of the liqnid. The portion which is in front of the lens is a little more than a very weak aqueons solution of salt, and is on that account termed the squeous humor of the eye. The portion which is hehind more nearly rsemhles a solution of white of egg. On accont of this somewhat thicker coosistency, it is termed the vitreous, or glass-like humor. Both humors, however, exert very nearly the same iofluence upon the vihrations of the light, and the optical part of the eye thns comes to he coosidered as composed simply of two refractiog parts—the denser lens and the thinner humors.

The iris is loosely suspended in the aqueous humor in front of the lens, so that it has the water-like liquid hathing hoth surfaces, and thus enjoys the same ready freedom of movement that it would possess if it were simply immersed in water. The hnmors of the eyes are supplemsntary aids to the image-forming capacities of the lens. But they are only suhordinate aids, as their influence in this particular is comparatively small. For simplicity's sake the crystal lens and the associated humors may he looked upon as together constituting one single lens, and the visual power of the eye in reality depends upon three curved surfaces which are found in the comhination of humors and lens—the front surfaoe of the glohe or corner, npon which light in the first instance strikes as it enters the transparent media of the eye, and the front snd the hack protuherant surfaces are of the crystalline mass itself. The position of the definite image within the eye is determined hy the form of these surfaces, taken in connection with the density of the crystalline substance and its associated humors.—*Edinburg Review.*

Science in the Navy.

The Navy Department has lately adopted a policy which promises no little advantage to the service and to science. Though the navy has heen honored hy the achievements of a considerahle numher of officers of eminence in scientific investigation, no effort has heen made to encourage or assist the development of such men, the department choosiog rather to employ civilians when any strictly scientific work has heen required; and it is perhaps not too much to say that in general the professional spirit of the service has not been favorahle to scientific studies.

At the suggestion of Admiral Rodgers and Professor Monroe, of the Naval Academy, the department has now detailed five midshipmen of scientific tastes and general intelligence for duty in the Smithsonian Institution, where, under the direction of Professor Baird, they will enjoy special advantages for pursuing their studies and for receiving practical training in the work of scientific observation and investigation. The opportunities for scientifie study which our naval officers have in times of peace (which happily for the country are seldom interrupted) are constant and favorahle, hoth in home and foreign waters, and the country cannot fail to he greatly advantaged if it hecomes the fashion in the service to spend leisure time profitahly. That any loss of courage or executive ahility in war can follow from such studies is not to he imagined.

Concerning actinium, the new element, whose discovery and identification hy Dr. Phipson was recently announced, it may be said that the opinion among chemists is very largely in favor of the genuineness of the discovery. The remarkahle thing ahout it, however, ie the fact that Dr. Phipson has found it present in a comparative'y large quantity—as much as 4%—in certain kinde of commercial zinc; and the mystery is that it should so long have escaped the notice of chemists. The *Chemical News*, one of the leading journals devoted to chemistry, in an article discussing the discovery of Dr. Phipson in favorable terms, states that the quantity of actioium sulphide obtained from the white pigment amounts to no less than 4%. Thie yield is enormous. The presence of this new element in zino will account, prohahly, for the discrepancies noticed in the equivalent of this metal, as determined hy various observers. It exists, evidently in considerahle quantities in some kinds of commercial zinc.

Paris has a market for cigar etumps. In the wine saloons in the Place Mauhert are a half dozen wholesale dealers who huy the etumps from gamins and poor old people. The length of the stumps counts something in the price. Much of this tohacco is sold to workmen, and much is also exported.

Effect of Compression on Solids.

We have already referred to the effects of compression on solids, hut the following from the French *Scientific Review* gives some additional facts, which may be interesting to some of our readers:

The suhstances experimented with were taken in the form of fine powder, and suhmitted, in a steel mold, to pressures varying from 2,000 to 7,000 atmospheres, or ahout 7,000 kilograms per square centimeter. The facts observed are given in a series of tables, from which we extract some of the more curious results.

Lead filings at a pressure of 2,000 atmospheres were transformed into a solid hlock, which no looger showed the least grain under the microscopo, and the density of which was 11.5, while that of ordinary lead is 11.3 only. At 5,000 atmospheres the lead became like a fluid and ran out through all the interstices of the apparatus.

The powders of zinc and bismuth, at 5,000 to 6,000 atmospheres, gave solid blocks having a *crystalline* fracture. Toward 6,000 atmospheres zinc and tin appeared to liquefy. Powder of prismatic sulphur was transformed into a solid block of octahedric sulphur. Soft sulphur and octahedric sulphur led to the same result as prismatic. Red phosphorous appeared also to pass into the denser state of hlack phosphorous.

As may be seen from this, simple hodies undergo chemical transformations by the simple action of pressure. The chsnge of amorphous powders, like that of zinc, into crystalline maeses, is a sort of self-comhination. Certain hard metals do not lose their pulverulent structure at any pressure.

Binoxide of manganese and the sulphides of zinc and lead in powder weld when compressed, and exhihit the appearance, respectively, of oatural crystallized pyrolusite, hlende, and galena; while silica and the oxides and sulphides of arsenic undergo no agglomeration.

A certain numher of pulverized salts solidify through pressure and hecome transparent, thus proving the union of the molecules. At high pressures the hydrated salts, snch as sulphate of soda, can he completely liqnefied. Various organic suhstances, snch as fatty acids, damp cotton, and starch change their appearance, lose their texture, and consequently undergo considerahle molecular change.

Explosion of Aqua Ammoniæ.—The *Pharmaceutical Journal* records a recent case of an explosion of ordinary liquor ammoniæ, followed hy serious results. A Belfast woman, suhject to headache, sent her daughter to the druggist to purchase a small quantity of "head salts," for which he gave her liquor ammoniæ, or "spirit of hartshorn," instead of the salt, carhooate of ammonia. The vial was put on a shelf and not used for a few days. Having a headache, the woman lifted the remedy to apply it, and had it in her hand for a few minntes only when the vial snddenly exploded, scattering the contents over her face. Her eye was destroyed, and her mouth and throat hurned, the skin of hoth having heen torn off. The vial had heen put on the mantlepiece previous to the time it was used, and when ahout to apply the contents, the woman was sitting near the fire.

An Electrical Stature Alarm.—A curious application of electricity is described in *La Lumiere Electrique*. It consists in a device to prevent military conscripts practicing fraud as to their stature hy hending their knees. When the youth stands erect against the measuring post, the hind parts of the knees press on electric contacts, causing two hells to ring; the ringing ceases when there is the least hending. The sliding har which furnishes the measure, has also a contact, which is pressed hy the head, whereby a third electric hell is affected. For a correct measurement, the three hells should ring simnltaneously. This system, the invention of M. Cazala, is now employed in the Spanish army.

A New use for photography, in connection with the higher arts, has been found in the discovery that it may he relied upon to detect any restoration or tampering with old paintings. On recently examining the first proof of a well-known Madonna, in the British National Gallery, the photographer observed a disfiguring hlur over the forehead. No such hlur was discernihle in the original, except upon close inspection with the aid of a magnifying glass. The microsoope examination showed that the restorer had repaired some casual damage with a skill that reproduced the color and the texture of the painter; hut he had not nsed the same pigments, and this was instantly detected hy the suhtle chemistry of light.

Lamp hlack has heen fonnd hy M. E. Mercadier to act like seleuium in radiophony. Inetead of eelenizing one of the surfaces of the double-coil receivers, he blackens it with the smoke of an oil lamp, taking due care, however, not to carhonize the parchment paper which isolates the metallic coils from each other.

David Gill, the astronomer royal at Cape of Good Hope, has puhliehed his calcnlations of the solar parallax made for observatione of the planet Mars, in the Island of Ascension, in 1877. He makes the parallax 8.78, which will give as the mean distance of the earth from the sun, 93,080,000 miles.

SUTRO TUNNEL.—In the report of progress of the Sutro tunnel, the superintendent says: At about 6:30 o'clock A. M., Jan. 31, connection was made with the drift made by the Overman Co. from a point 200 ft. west of the Foreman shaft. The connection wae an excellent one and a credit to the engineers who ran the lines, Messrs. Specht, Craven and Wrinkle. The Overman drift was somewhat too high, but can be easily remedied by cutting it down to the proper grade. Distance from Julia turning point at last report, 6,142 ft.; driven since, 100 ft.; total, 6,242 ft. Distance of point of connection from Yellow Jacket turning point, 2,603.23 ft.; to a point 200 ft. west of the Forman shaft, 816 ft. The *Enterprise*, in speaking of the statement that the bottom of the drift must be cut down says: This is not because the survey was not exact, nor does it in any way detract from the exactness of the connection. The workmen purposely left the floor a little high as they approached the point of connection, in order that the water might flow back toward the shaft.

THE colored population of Nevada ie less than 400. There are 5,416 Chinese and 2,803 Indians in the State.

Mining Share Market.

Businese on the etock hoards is very dull indeed. At the first session of Thursday, only 17 etocks were dealt in, and of these, 15 were Comstocks.

The lateet Comstock notee are as follows, dated the 8th: Only a few feet remain to connect the main Savage incline with the 2400 level. All work ie now being done from below, as it would he dangerous to have men working on both sides.

Arrangements have been made hy which the Alta Co. will at once start a drift south for the Justice Co. on the 2150 level. This drift will he etarted from a point ahout 30 ft. for the face of the east drift. Thie will carry it just outeide the west casing of the Woodville vein. At this point the Alta people will start a drift of their own to the northward.

Seams of quartz showing etreake of ore have been cut by the north drift on the 2700 level of the Union Con. and Mexican mines.

The following mining companies have cash on hand February 1st: Argenta, $786.08; Andee, $2,991.37; Belle Isle, $1,477.54; Crown Point, $5,811.13; Challenge, $318.84; Bodie Con., $38,345.47; Bechtel, $11,009.09; General Jackson, $5,339.43; Hale & Norcross, $14,006.66; Julia Con., $2,376.24; Juetice, $21,056.99; Mono, $1,452.76; Mexican, $1,809.82; Northern Belle, $47,104; North Belle Isle, $5,276.05; Ophir, $1,651.09; Potosi, $23,019.28; Saratoga, $7,664.94; Silver Hill, $1,360.95; Sierra Nevada, $15,534.62; Tioga, $2 119 62; Union Con., $1,380; Alta, $40,526.82; Benton Con., $6,866.49; Belding, $591.17; Lady Washington, $1,999.12.

The following companies had an indebtedness February 1st: Alpha, $6,459 45; Alhion, $4,208.13; Best & Belcher, $27,139 85; Bullion, $27,498.62; Betty O'Neal, $2,460 28; Chollar, $5,148.78; California, $73,998 33; Day, $91,438.54; Exchequer, $4,572.22; Gould & Curry, $22,594.27; Imperial, $19,363.47; Independence, $283.01; Leede, $4,536.11; Mount Diahlo, $23,094.35; New Coeo, $1,125.56; Overman, $15,624.05; Utah, $2,127.21; Con. Virginia, $16,825.35; Star, $8,784 62.

REPORTS from Mohave, Arizona, state that the mine recently discovered hy Jack Johnson promises to he the "biggest thing" in the mineral way in that whole region. Local experts still differ about the character of the ore, hut many eteadfastly maintain that it ie telurium.

Meetings and Elections.

General Jackson M. Co., Feb. 6. Directors—W. H. Sears (President), W. E. Norwood (Vice President), H. H. Al'en, George W. Fisber and Horsce Webster. R. W. Heath, Secretary, and R. J. Jones, Superintendent. It was resolved to make application to list the stock of the company on the San Francisco Stock and Exchange Board.

Sulphur Bank Quicksilver M. Co., Feb. 6. Directors—Tiburcio Parrott, D. O. Mills, Peter Donahue, W. E. Sabcock and J. W. Burling.

Standard Con. M. Co., Feb. 6. The old Board and officers were re-elected, with the exception of Washington Lee, of New York, in place of J. M. Masterton, of New York.

San Francisco Copper M. Co., Feb. 6. Directors—Jeffrey Cullen (President), Antoine Borel (Treasurer), Pelham W. Ames, M. A. De Laveaga and William Harney. R. H. Pond was cbosen Secretary, and John E. Ellis, Superintendent.

Manhattan M. Co., Feb. 2. Directors—A. K. P. Harmon, C. E Gibbs, E B. Pond, M. Curtis, R. W. Paxton.

Father De Smet M. Co., Feb. 3. Directors—J. B. Haggin (President), J. Clark (Vice-President), Thos. Brown, Thos. Bell, Thos. Menzies. H. Deas, Secretary. H. M. Gregg, Superintendent.

Holmes M. Co., 1st. Directors—A. J. Holmes, W. S. Hobart, W. E Sell, R. E. Wilson, J. E. Dixon.

California Powder Works Co. Trustees—N. G. Kittle, G. T. Lawton, J. B. Haggin, N. Luning, J. O. Earl. President, N. G. Kittle; Vice-President, G. T. Lawton; Secretary and Treasurer, John F. Lobse.

New Incorporations.

The following companies bss been incorporated and papers filed in the office of the Superior Court, Department No. 10, San Francisco:

General Miller M. Co., Feb 4. Location, Takou Co., Alaska. Capital stock, $5,000,000. Directors—William Corcoran, G. R. B. Hayes, A. J. Bryant, George E. Pilz and W. M. Pierson.

Jeannette M. Co., Feb. 4. Location, Takou Co., Alaska. Capital stock, $5,000,000. Directors—Daniel Callaghan, A. K. Durbrow, J. M. Gitchell, George E. Pilz and Wm. M. Pierson.

Jamestown M. Co., Feb. 4. Location, Takou Co., Alaska. Capital stock, $5,000,000. Directors—O. B. Jennings, Wm. M. Pierson, A. K. Durbrow, George E. Pilz and William Corcoran.

Maryland M. Co., Feb. 4. Location, Takou Co., Alaska. Capital stock, $5,000,000. Directors—Daniel Callaghan, C. D. O'Sullivan, George E. Pilz, George W. Reynolds and C. B. Jennings.

Czar M. Co., Feb. 4. Location, Takou Co., Alaska Capital stock, $5,000,000. Directors—C. D. O'Sullivan, Daniel Callaghau, Geo. W. Reynolds, Geo. E. Pilz and J. M. Gitchell.

Bryant M. Co. Location, Takou Co., Alaska. Capital stock, $5,000,000. Directors—A. J. Bryant, C. D. O'Sullivan, George E. Pilz, George W. Reynolds and George R. B. Hayes.

Germania Lead Works Co., Feb 7. Location of works, San Francisco. Capital stock, $500,000 Directors—F. W. Billing, E. E. Eyre, W. D. O Sullivan, A. W. Bowman, Joseph G. Eastland, Joseph B. Roeeborough, J. G. Kellogg, W. A. Aldrich, Lewis Gerstle.

MINING SUMMARY.

The fellewing is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

ALPINE.

BULLION.—*Monitor-Argus*, Jan. 30: On Sunday last, the Isabel Gold and Silver Mining Co., Limited, made another shipment of bullion, to the amount of about $1,400, the product of the Stella mine.

AMADOR.

PLYMOUTH.—Cor. Amador *Dispatch*, Feb. 4: Since Supt. Robinson took held of the Empire mine, the increasing rear of her eighty-stamp mill tells but too plainly the immense amount of ore being extracted and crushed in this mill. The Pacific will have the water in in a few days, and an additional rear of forty stamps more will chime in, thereby helping to fill Plymouth's great mining cheir, and when the Alpine, the Jebns, the Aden and Weolford, and many others in enr immedlate vicinity strike the golden lyre, the music will be complete, and Plymouth, with ber golden harvest fields, and productive gardees and vineyards, will become the great mountaiu city of the Pacific coast. This is no overdrawn picture, and te-day the prespects of Plymnuth are bright for a glerious future.

STONY CREEK CLAIMS.—*Ledger*, Feb. 4: A correspondent writing from Stony creek concerning the mining interests of that vicinity says: The New York mine, located on the south side of Jackson creek, one mile south of Kittridge's mine, has lately struck a ledge ten ft wide, of good milling ore, and still the crosscut bas not reached the foot-wall. The owners feel quite elated over these prospects, and improvements will be erected as soon as circumstances require. The Kittridge claim is lying idle for lack of capital to develep it. I am inclined to think there is bardly a better prospect to be found in Amador couuty. There is a large body of rock of good quality in sight, sufficient to keep a mill running for a lengthened period. Capitaliste bave an idea that there is nothing worth looking at in the way of a mining claim unless it is located on what is known as the mother lode. But judging from the formation, and the developments already made, I believe there is not a better region for the iuve tment of capital in this county than the belt of which I am speaking. The formation is slate, and the ledge runs a little west of north, the quartz being very prominent, and traceable for a long distance. Claims are being located very fast.

KEARSING.—This mine, located in Jackson, and owned by Ginocchio Brothers, is having the water taken from the shaft, with a view of being examined by experts in the interest of capitalists below, who are thinking of purcbasing it.

GOLDEN GATE.—The Golden Gate mill, after long waiting for water, was at last started up on steam, and the stamps are now pounding away, after a silence of nine months.

PINE GROVE.—Mining operations at Pine Grove are looking up. Mr. Wheeler and another man have recently taken up a quartz claim on the Grass Valley creek below Dane's mill, which prospects for 600 ft along the croppings. They propose to put men immediatcly to work taking out rock and crushing the same at Dane's mill. Capt. James White, Supt. of the Providence Con. G. and S. M. Co. finds his recent purchase exceedingly promising. They have 3 claims near Pine Grove. Wm. Doyle visited them this week, and reports the Nabob looking splendidly, with a ledge 4 ft thick. Forty tons of rock have already been taken out, which prospects $25 per ton. Grading for a mill and boisting works is now being vigorously prosecuted.

BUTTE.

PROSPECTING.—Oroville *Mercury*, Feb. 5: A report is abroad that E. J. Davis and Major McLaughlin, in conjunction with Messrs. Braken, Benson and others are preparing to take water from the Miocene ditch for piping on mining ground near Nelson Bar, opposite the Curtis ranch. There has been a good deal of tunneling and prospecting in the vicinity for the past 25 years, and it is believed there are millions of gold there, but that it can be obtained only by hydraulic mining. They propose to prospect it.

CALAVERAS.

THE BLACK OAK.—Angels *Echo*, Feb. 2: The proprietors of the Black Oak mine, Messrs. Osborn & Fisher, have recently erected a dwelling-house on the mine and have made other necessary preparations for working the mine systematically. This mine is situated 3 miles northwest of Angels, and is said to be one of our richest quartz mines. The proprietors tell us that in prospecting on the main lead last week, as bigh as $3 to the pan was obtained.

RICH MINE.—A gentleman who visited the Potter mine near Angels recently, says be went down the shaft, which is over a hundred ft deep, and found the main vein to be from 0 to 14 ft in width. The ore averages from $14 to $15 per ton, and can be obtained at a small outlay. The proprietors are stoping, and are getting out quartz very rapidly. Overhead is a vast body of ore, which it is estimated will produce from $30,000 to $40,000, and over 300 tons is now on the dumps, ready for crushing.

MURPHYS ITEMS.—The Red Wing mine is working day and night, and turning out most beautiful rock. This mine is one of the group of mines owned by the Ora Plata Mining and Milling Co, and is a valuable piece of property. The company own several good mines in the immediate vicinity of Murpbys, and with the mill in full operation, employ a large number of men. The mill is now idle, owing to the failure of water supply. The Union Water Co.'s ditch must have frozen up nearly solid at its head; we have seen no time within the last 3 years when there was such a scarcity of water as now, and bave any at all.

EL DORADO.

CLEAN-UP.—Georgetown *Gazette*, Feb. 3: A partial clean-up was made in the Eureka mill last Saturday, the result being highly satisfactory to all. The run is being made on what is considered the poorest ore on the dump, which, if it is now believed, is yielding at least $7 in free gold to the ton. There appears to be about 1 ton of sulphurets to 7 or 8 tons of ore, which Mr. Powning, the mill operator, informs us will yield $60 or more per ton. This places the ore at about $15 per ton, which, we understand, is near the results of the mill tests which Mr. Baird had made from the ore shipped to the East last summer. There are about 1,000 tons of ore on the dump, enough to keep the little mill running more than two months. So far the new crusher and grinder (unlike any mill on this coast), is giving entire satisfaction, but the mill has not yet been sufficiently tested to prove its durability. Upon a trial test 1 day last week, 1,700 lbs. of ore was put through the mill in 1 hour. This would give more than 20 tons in 24 hours, but we think 17 tons in 24 hours is all that the mill can crush of this hard ore and do good execution.

EXTENSION.—When a big pocket is etruck or a mine is discovered which promisee to be a good property, how natural it is for people to flock in and locate every foot of the adjoining ground, and too, in most cases, without a color in rock in place. We believe this is a good thing when the locators take hold and prospect their claims with earnestness, for sometimes mines are thue found eurpassing the original. The extensions of the Eureka have been taken up, and before another year we would not be surprised at bearing of important developments made on that line.

STEAM UP.—El Dorado *Republican*: The Placerville Gold Quartz mine ebut down for a few days, hoping that a water eupply would eoon be forthcoming, but as the prospect began to look dubious, steam was got up and work proceeded with as usual.

INYO.

COSO EAST.—Inyo *Independent*, Feb. 4: Roy Cook, one

of the owners of the Mountain Chief mine, located in Coldwater canyon, 12 miles northeast from Bishop Creek, passed through Independence last Monday on his way to St. Louis. His trip East is in the interest of the Mountain Chief and the adjoining property, the Valley Queen mine.

LOOKOUT.—Frank Fitzgerald returned to the Modoc region from San Francisco on the 30th ultimo. He is still lessee of the entire property, and at present has a working force of 14 men, which may be increased to 50 within 10 or 12 days. Some 45 tons of ore were extracted while he was in the city.

BONDED.—Without being able to give the figures, we may state that the famous Kearsarge property has been bonded for 4 months to Dr. S. H. Squire, of Gold Mountain. It is understood that in the meanwhile the bonding party will carry on extensively the work of developing the mine, and at the end of the time has the privilege of buying it or not.

INYO CONSOLIDATED.—Everything is running here splendidly, although the weather has caused a number of the old weather-cocks of Panamint to predict that it would be impossible to run the mill at all. This successful run in the middle of winter, with snow and frost to battle against is really astonishing. The mill is running steadily to its fullest capacity, and working the ores closer than has been done heretofore. Some time in the future I will give you figures. Nearly all the company's ore that was at the mill has been crushed. Will commence tonight on Martin Mee's and Judge Russell's ores. After that Messrs. Robert Mitchell, J. A. Lee and Isaac Wagner will send through a number of tons of rich chloride ores, taken from some of their best claims. Their ore will no doubt work $300 per ton. The Deputy Recorder for this district has recorded about 40 claims since the 1st of January. A party of Eastern men are expected here tomorrow, who will look around and no doubt interest themselves in this camp. For the past few days it is not unusual to see from 2 to 5 men, principally prospectors, coming into our camp, eager to take chances and help develop this the great mineral region.

BROWN MONSTER.—Alex. Clarke's contract for cleaning up the Brown Monster mill has been retarded by the cold snap, which prevented a run of water in the big ditch.

BORAX HUNTERS.—Billy Hedges and Wal. Phillips are off on an excursion to Saline valley, ostensibly on a hunt for horse flesh.

REX MONTIS.—Supt. Holt is engaged in putting the Rex Montis mill in perfect order for work during the coming season.

MARIPOSA.

BULLION.—Mariposa *Herald*, Feb. 3: A considerable quantity of bullion is being occasionally shipped from the silver mines below town. It is of a very fine quality, and is worth about $3 per ounce. The last shipment was about 50 pounds. We learn that the Reed Talc mine is undoubtedly a success. The patent pulverizer recently put in has a capacity of pulverizing about 30 tons of talc per day. The mine is operated by the Shreve company. The Marble Spring or Compromise mine is now owned by a company who have a 10-stamp mill on the premises. A pocket was struck in the mine some week or 10 days ago which is said to have been very rich. Excellent rock is now being taken from the Peter Longhurst mine, on Bull creek. A quantity will soon be crushed as a test of its richness. It is the general opinion of those acquainted with the ore that this mine will be a good-paying enterprise. The *Star* learns that 1 day last week 2 Austrians who were mining in the hills near Hornitos came across a pocket out of which they realized over 230 ounces in gold. The vicinity of Hornitos is rich with these pockets, as thousands of dollars have been taken from the placer mines of that district.

MONO.

BODIE.—*Free Press*, Feb. 7: We expect that the Standard will find an ore body of great importance at depth. This expectation is based on the theory that a ledge formation does not lose itself as depth is attained. Sometimes barren country is encountered in a mineral zone, yet the distinctive character of gold and silver remains. During the past week good headway was made in the Oro shaft, and the Noondays took out considerable ore. Prospecting from the Red Cloud shaft still continues. The Lent shaft is the scene of activity, and it will not be long before crosscutting will be going on. Below will be found our usual weekly summary of operations in this district.

STANDARD CON.—During the past week there was extracted and shipped to the mills 1,300 tons of ore from the 385, 500, and 550 levels. The average pulp assay for the week was $14.41. The amount of bullion shipped to San Francisco was $59,817.88. The stopes are looking well as usual. The ledges continue to hold their usual width.

BODIE CON.—During the week ending the 4th there were 74.975 tons of ore hauled to the mill, and 73 tons were extracted from the mine. The mill crushed 91.08 tons. The average pulp assay was $70.06 per ton. The shipment of bullion amounted to $8,227.60.

TIOGA.—The quartz mentioned in the last report still continues to improve.

BONNE TUNNEL.—Ore is being extracted as usual from the north and south stopes.

OHIO.—During the past week the main shaft has been sunk and timbered 22 ft, and it is now 723 ft deep. The rock has been much softer.

UNION CON.—The south drift on the Bonner lode has been advanced 13 ft; total length 119 ft. The ground in the face is breaking well.

BOSTON CON.—The winze below the 400 level has been sunk 7 ft; total length 20 ft. The vein is 2½ ft wide.

RED CLOUD CON.—West crosscut, 600 level, was extended 10 ft during the week. Good progress is being made in cutting out the station for the hoh of the 700 level. All the machinery is working well.

CON. PACIFIC.—The north drift on the 130 level has been advanced 14 ft; total length, 07 ft. The face is in a good formation, and prospects well in gold.

GOODSHAW.—The east crosscut on the 750 level has been advanced 14 ft during the past week. The formation is favorable. A strong flow of water continues.

NORTH NOONDAY.—Ore from the 312 and 412-ft stopes has kept the mill fully supplied during the past week.

NEVADA.

STRUCK THE CHANNEL.—*Tri-Weekly Herald*, Feb. 2: Yesterday the workmen at the Gold Spring mine struck the gravel channel, and the prospects are very encouraging. The owners feel somewhat jubilant and anticipate soon making some rich developments in their mine. We hope they will, as they have been very energetic and have kept up work for a long time. The present tunnel is in 1,360 ft., and 3 years' time has been consumed in running it. The stockholders have expended considerable money and it is now time they were getting some return.

WILL BEGIN DRIFTING.—Drifting in the Sargent & Jacobs claim at Quaker Hill will be resumed as soon as the shaft is pumped free of water and a new pump put in. At present the claim lies idle.

HOMEWARD BOUND MINE.—Grass Valley *Union*, Feb. 5: The water in the incline shaft of the Homeward Bound mine (Menlo Co.) has been pumped out, to the depth of 270 ft. An additional compartment to the shaft is being constructed, which, when completed, will give the shaft 3 compartments—two for track-ways, and 1 for pump and ladder way. At a depth of 233 ft in the shaft a station is to be cut out, when a tunnel will be immediately started to connect with the tunnel being driven in from Wolf creek. The tunnel on the Wolf creek end is now in a distance of 160 ft, and about 1,300 ft will have to be run to make a through connection. With this work going on at both ends good progress in construction will be made. Mr. Bethell has just completed the necessary surveys for the tunnel. A tunnel is also to be extended from the Homeward Bound shaft into the Wisconsin ledge, which is a parallel vein.

GOOD ROCK.—The Eureka No. 2 quartz mine, near Nevada City, which is under the superintendence of John Trenberth, is turning out some fine-looking rock from the drift at the depth of 125 ft. It shows well in coarse gold and auriferous sulphurets. Mr. Trenberth says the rock will go $100 per load. The ledge is of an average width of 8 inches. The last crushing from the mine yielded $60 per load.

PLACER.

DAMASCUS.—Placer *Herald*, Feb. 4: G. W. Snyder, of Damascus, one of the owners in the famous old Mountain Gate drift mine, informs us that the old mine is still paying first rate, the product of last week's work being about 75 ounces. Where they are working at present, in the deeper blue gravel channel, the water has to be pumped and the dirt hoisted to the level of their old working tunnel. For this purpose they have been using an old-fashioned over-shot water-wheel, which is hardly adequate to the demands upon it. To meet the defects they have had made and are now putting in a new turbine wheel of a style and pattern made especially for their case. It is only 8½ inches in diameter, but with 17 inches of water under 45 ft pressure, it will make 900 revolutions a minute and will exert a seven-horse power.

WERRY'S OPERATIONS.—Capt. Wm. Werry, late superintendent of the Rising Sun G. M. Co., at Colfax, has returned to his old stamping ground west from Ophir, where he is opening a quartz ledge of his own, with most gratifying prospects. Some disagreement arising between him and the management, and having property of his own needing attention, he severed his connection with the Rising Sun mine, and is now occupied with the Belmont mine between Ophir and Lincoln. He informs us that the Belmont is probably sold to San Francisco capitalists; the ore tested by mill process yielding something over $35 per ton.

PLUMAS.

MILL.—Greenville *Bulletin*, Feb. 4: The superintendent of the Taylor-Plumas mine is urging the company to put up a 20-stamp mill immediately. Mr. Hammond and partner are running a tunnel on a ledge nearly parallel to the Ruby ledge at the Green Mountain. They estimate that about 60 ft farther will strike the principal, part they are aiming at.

TUNNEL.—Bachelder & Wing are running a tunnel to strike their ledge about 300 ft below where they have yet taken out any ore. They have a double shift of men working and make 8 feet every day. They estimate the length of the tunnel at 400 ft. They have ore enough out now to keep their mill running till April, and it averages the same as from the 1st beginning.

MUSICK.—Last fall W. E. Adams found a ledge in Round valley that opens out so well that he believes good pay can be made on it by working with a hand mortar and stamp. He has put up a cabin and will use a hand-stamp weighing about 150 pounds. This will be attached to a spring-pole and be expects to crush nearly a ton of rock a day. He believes the rock will yield from $40 to $50 a ton.

ALTONA.—Thomas Davis has men at work putting in a tunnel on the Altona claim. The tunnel is now in about 100 ft, and most of that distance is in ore. At first the vein was only about 18 inches wide, but kept getting wider, and at present is about 3 ft wide. The whole ledge matter prospects well, and good judges of ore are confident that it contains $20 a ton. This claim belongs to T. F. Emmons, J. P., and has been prospected at several points by tunnels run some years ago; quantities of the rock were worked and gave good results, but at the time this was done there was no mill in the neighborhood and further work was given up for the time. Now that milling facilities are near by, the mine will be fully opened and worked.

QUINCY.—The Consignee Mining Co. have struck pay from 10 to 50 cents to the pan.

SISKIYOU.

COLD WEATHER.—Yreka *Journal*, Feb. 4: Mining on McAdams creek has been suspended to some extent lately, like other sections, in consequence of the cold weather, which froze up the water supply of the drifting claims, although the Oak Grove is able to keep going as usual. The Yreka Creek M. Co.'s men are getting ready to start operations since the snow storm, but are troubled with snow in bringing the water down the upper ditch, so that it will take some time to get a supply into the reservoir. Operations will be commenced again at Hawkinsville in a day or two, with plenty of water to run day and night. Work in the Centennial mine, Klamath river, has been resumed again, and as soon as the ice pit thaws, the pump will be started to lift the water out. Should the weather remain cool, work can be continued for some time yet, but if we have a warm rain the river will no doubt be elevated so as to oblige the company to pull out. The Lime Gulch Co. still continue work, their ground being in a good locality to come under the warm influence of the sun every day, to prevent the water in pit and sluices from freezing, or the accumulation of ice on the wheels.

TRINITY.

NEW RIVER.—Cor. Trinity *Journal*, Jan. 21: We are having the most desirable weather for mining this winter. It is not as cold as it generally is at this season, and with an average of a storm a week the water keeps well up in the creeks. Very little money has been taken out so far, as everyone is running off top gravel, but all are satisfied with the prospects for the season. Boles & Co. are running this winter on Sailor's Bar and will set boxes in a month; they are using about 1,000 inches of water, or about half the capacity of their ditch. On Big Flat the Portuguese Co. are running two claims with good prospects in both. One mile below them is another Portuguese Co., on what is known as Jackass Flat. This is a large bar and a very light one to work, there being but few bowlders; their dump is high and the gravel pays from top to bottom, but they have only a small head of water, not lasting over four months in the year. Carson & Donald made a clean-up after two days' run, intending to bunt the best place on their bar to work this winter. They realized $27. Satisfied with this result they are now sluicing in that cut and will no doubt do well. S. Noble is still scraping and scratching on Slide creek and doing well upon what those who ran the claim last winter did not think worth the looking after. In quartz I have most gratifying results to report from one quarter. In a letter last spring I mentioned the discovery of a ledge on Eagle creek. Mr. Heley, the discoverer, has been quietly working on it at odd times ever since. He says but little about what prospect he has had from the ledge, but no doubt he has had a good one, judging by the way he is working at it. S. Noble has bonded his claim on Pantber creek to a San Francisco party for $3,000.

SAN BERNARDINO.

ARMAGOZA.—Inyo *Independent:* We are in receipt of a letter from Supt. E. L. Smith, formerly of the Los Angeles Co.'s works at Resting Springs. He is now managing the Armagoza mill, situate in the extreme northwestern part of San Bernardino county, owned by the South Pacific Mining Co., of New York. The nearest postoffice is Evanpah, located on the map way off to the southwest of the mines and mill. We believe some of the mines are located in this county, but the geography of the country, to pretty much the whole world, is about the same as the Greek language to a Hottentot.

TUOLUMNE.

PROSPECTORS.—Tuolumne *Independent*, Feb. 4: Mr. W. N. Harris, of Jamestown, is now dropping 50 stamps daily on the Little Gem and Alabama mines. Everything about the promises is in a prosperous condition. The ore that is being quarried out of the 12 ft ledge on the Alabama satisfies the proprietor each clean-up with far greater profits than would the same amount of money invested in any other enterprise.

NEVADA.

WASHOE DISTRICT.

SIERRA NEVADA.—*Enterprise*, Feb. 5: On the 2700 level the joint Union Con. east winze has been sunk and timbered 7 ft, and the main north lateral drift was advanced 18 ft.

ALTA.—Since last report the east drift on the 2150 level was extended 30 ft and timbered 40 ft; total length, 779 ft. The face of the east drift is in the casing of the ledge, through which some water is exuding, but we do not anticipate much water at this point. Rock hoisted, 544 cars; wood consumed, 74 cords; strokes made by pump, 62,200.

YELLOW JACKET.—The east crosscut on the 2328 level was extended 19 ft since last weekly report, making the whole length of the same 227 ft; ground, porphyry and quartz. Have resumed work in the east crosscut on the 3000 level at the foot of north winze, which is this day out 50 ft.

UTAH.—Connection of pumps completed to the 2500 level. Are now timbering and repairing the incline.

MEXICAN.—On the 2700 level the main north lateral drift has been extended 20 ft and the main south lateral drift 10 ft.

UNION CON.—On the 2700 level the main north lateral drift has been advanced 22 ft, the main south drift 30 ft; south drift No. 2, 15 ft, and east crosscut No. 1, 24 ft.

CON. VIRGINIA.—Are still cleaning out and repairing drifts and winzes. On the 1650 and 1750 levels are connecting with the old Con. Virginia shaft.

CALIFORNIA.—On the 1650 and 1750 levels are clearing out and repairing old drifts and winzes connecting with the old Con. Virginia shaft.

OPHIR.—During the week 134 tons of ore have been extracted from the croppings, and 153 tons and 510 lbs. sent to the mills. Assay not yet received from the mill.

CANDELARIA DISTRICT.

NORTHERN BELLE.—*True Fissure*, Feb. 4: Twelve ft have been added to the depth of the main shaft since the last report; total distance made to the 1st inst. being 37 ft. The levels above the adit look full as well as last week. Between the 8th and 9th levels the outlook is very encouraging for opening into ore of the same character as that found before in these levels. There are being extracted and sent to the mill about 63 tons of ore daily. Shipments for the week ending Feb. 2d, $17,057. Total shipments on January account, $66,470.91.

MOUNT DIABLO.—The sinking of winze No. 1 has been suspended for the present. The east drift from winze No. 3 is in 120 ft and is showing a 6-inch streak of ore in the face, from which a picked sample assayed $200. There is no change on the 2d level, though some good ore is being obtained from the east drift above the stopes on the 3d level. The Northern Belle mill started crushing ore from this mine on the 1st inst.

CHERRY CREEK DISTRICT.

NO MINERS WANTED.—White Pine *News*, Feb. 4: We regret to have to state that the inducements for newcomers here, just at present, are anything but flattering. Two mining companies have within the past month suspended operations, and it is not at all likely they will be resumed before spring opens. Several skilled miners have left here for other parts in the past two weeks, and there is a large surplus of idle men here just now. It is sheer folly for any one looking for employment to turn his steps towards Cherry creek. At no time within the past two years were the chances for obtaining employment so few as at present.

ESMERALDA DISTRICT.

THE UTAH MINE.—Esmeralda *Herald*, Feb. 4: Next week prospecting will be started in the Utah, and we confidently predict big things from this rich and famous mine. The Cortez and Utah companies are fortunate in having Judge Wells to develop and manage their properties. We inquire: Who said Aurora was dead? Not much. It has been resting, and will awaken into its new existence richer and more lawful than in its halcyon days of yore.

THE CORTEZ MINE.—Work in the above mine is going steadily ahead with most satisfactory results. Splendid developments are being made in the drift toward the Utah line. Work has been commenced on a winze running from the lower tunnel level, which will be pushed until water suspends operations. An extra force of miners will be put on in the course of a week or so and the work stopped by the late draft resumed.

FLORENCE DISTRICT.

SEDAN CO.—Belmont *Courier*, Jan. 25: The Sedan Co. have made a discovery in the Waldeck mine situated in Florence district, this county. Samples of ore taken from this mine received at this office average from $145 to $150 in silver to the ton. Mr. Charles B. Streitberger, one of the owners, writes that the company can furnish 25 tons of ore every 24 hours by working 8 or 10 men. Here is a good chance for some enterprising millman to try his luck.

LEWIS DISTRICT.

STARR-GROVE.—Lewis *Herald*, Feb. 1: The incline on the Starr-Grove ledge has been sunk at the rate of about 4 ft a day. The ledge in the winze still keeps its width and the ore is of good quality. The stope is now opened and ready for the extraction of ore.

EAGLE.—J. Penrose, contractor in the Eagle tunnel, has made good progress during the week, and is now in about 450 ft. The ledge is not nearly as broken, and has improved greatly in quality.

MORNING STAR.—The Morgan incline on the Morning Star mine is now 125 ft deep, in a good solid body of ore that assays well, both in gold and silver. There seems to be another ledge running parallel with the one that the incline is being sunk on and only a few feet distant.

SUN BEAM.—Latest reports from the Sun Beam mine are to the effect that the ledge has improved in the last week in quality, and still holds its own in size.

EMMA.—The contractors on the Emma mine are advancing the tunnel at a fair rate, and it should not be a great while before they strike the ledge.

HIGHLAND CHIEF.—The main incline on the Highland Chief is still being sunk by hand, the connections for the air drills not having arrived.

BETTY O'NEAL.—The stopes in the Betty O'Neal mine are looking away up, and Supt. D. P. Pierce feels jubilant. The body of ore struck a short time ago is proving a honanza, and the men are extracting at the least calculation half a ton per man per day. About 60 tons of ore is now piled up on the dump, which will mill $200 per ton. Stopes will be opened and the ore taken out as rapidly as possible.

SAFFORD DISTRICT.

ZANOLA.—Eureka *Sentinel*, Feb. 7: A correspondent writes us that an important development has been made during the past week in the Zanola mine at Safford. At a distance of 100 ft in the tunnel a body of rich ore has been struck. The character of it is the same as in the Onondaga. It shows strong, is 2 ft in thickness, and runs north and south. Gabriel intends passing through it to ascertain its exact thickness, when he will commence extracting it. The owners of this property are to be congratulated on their find, which fully demonstrates the existence of a ledge on the west side of the canyon. Negotiations are now pending for the sale of another valuable mine here, which will probably be completed in a few days. The purchasing parties thereof intend putting up hoisting works and will develop the property with great diligence.

SUMMIT SPRINGS DISTRICT.

SMELSER.—The *Silver State* recently published a well-written article on Summit Springs district, by an old miner, in which the Smelser mine was described. Mr. Smelser, one of the owners of the mine, informs the Lewis *Herald* that they are now 60 ft on the ledge, which a crosscut shows to be 26 ft wide at that depth. An average of the ore assays from $20 to $00 per ton in silver, and contains from 12 to 20% copper. The ore is not rich enough to ship, but could be concentrated, if reduction works were at the mine, so that it could be profitably shipped to smelting works.

WILLOW CREEK DISTRICT.

PROSPECTS.—Cor. *Silver State*, Feb. 2: A new strike has just been made on Rebel creek, which creates considerable excitement among prospectors. The ledge which has just been discovered is five ft wide, and the ore streak 2 ft thick. An average of this streak assays $230 in gold and $40 in silver to the ton. The Emma mine owned by A. H. Ruse, improves in appearance as depth is attained. The owner is now running a tunnel on the ledge, and is now in 100 ft under ground, and increasing the distance at the rate of 10 ft a week. This mine is situated about a mile and a half east of the Willow Creek Hotel. The Comstock mine, situated 6 miles east of Willow Creek, is owned by Cassidy, Siskron & Co. It was named Comstock because of the resemblance of the ore to that of the great lead of the same name. The ore assays from $80 to $800 to the ton, principally gold. The vein is opened by tunnel over 100 ft, and the owners are driving ahead at the rate of 8 ft a week. The width of the vein is not known, as they are following the footwall, along which there is nearly 2 ft of rich ore. They have not yet crosscut the ledge, which is considered by miners one of the best in the district outside the Ohio.

ARIZONA.

BONDED.—Arizona *Democrat*, Feb. 1: The Wade Hampton copper claim, in the Black Hills, has been bonded to Mr. Dewey, of Chicago. The bond is for 90 days, and the price $22,000. The Hampton is one of the best copper properties in the county. It adjoins the Eureka, sold some time ago by Messrs. Heed & Richards. The Hampton is now the property of Messrs. Ruffner & McDonald, who have developed the claim to a considerable extent. Two mines like the Eureka and Hampton, in the hands of men with means to erect reduction works, would be of great benefit to this town.

ASH CREEK.—John Stemmer came in from Ash creek last evening. He says the boys are digging away on the incipient bonanzas of that region, and that the claims are producing fine ore. John has staid with the works for years, and we feel certain will yet make it stick.

COLORADO.

SILVER KING.—Georgetown *Courier*, Feb. 1: The Silver King lode located in Spring gulch, and owned by the Hendrie & Bolthoff Co., of Denver, is developed through a tunnel and shows a 4-inch vein of solid galena and 8 inches of concentrating ore.

MACKEY.—The Mackey lode, owned by O. B. Weeks, M. Doyle and S. Rosenberg, is situated at the mouth of Spring gulch. It is worked through a shaft 140 ft deep, which shows about 2 ft of concentrating ore, and on the dump are nearly 100 tons of ore that would do to concentrate.

EUROPE.—The Europe lode, at the head of Washington gulch, is owned by Leithgwell & Co., who are working through a shaft 135 ft deep. The lode carries 6 inches of smelting ore that mills $198 per ton. They still do their hoisting with a whip.

MONSTER.—The Monster lode owned by D. G. Daigin & Co., is located in Washington gulch, and is also worked through a shaft, the depth of which is 150 ft. The shaft shows a fine ore vein and they contemplate sinking it to a depth of 250 or 300 ft.

WESTERN UNION.—The Western Union Co. is working seven men at present. The Morning Sun lode, owned by this company, continues to improve with depth. Last week they struck 5 inches of smelting ore that runs $180 per ton.

MENDOTA.—The Beck Bros. are still pushing work on their lease with remunerative success. They are working two shifts with 7 men. Three lots of ore were milled this week, but we have the returns from only one, which carried 57 ounces silver.

IDAHO.

ROCKY BAR.—Wood River *Miner*, Feb. 1: From a party just in from Rocky Bar, we learn that the residents of that snow-bound camp are jubilant over a streak of good luck in the way of recent rich strikes in the leading gold-producing mines. The Elmore is producing good ore and a few days ago made a rich strike in the western cut. The bonanza strike of the season, however, and one which makes the property second to none in this section, has just been made on the 300 level of the Bonaparte. Gold bearing quartz has been brought forth which upon assay yielded the highest results which a reasonable imagination could picture.

LAST CHANCE.—The Last Chance, a mine which is known far and wide for the beautiful specimens which it has produced, is no longer worked by individuals but is now under the management of Col. Matt Graham, who is running it on correct principles, and is working it as a mine.

NEW MILL.—The Johnson brothers, who are chief owners of the Mountain King, Vienna, Treasure Group and a large number of other mines near Vienna and Sawtooth, have been East during the winter, and have improved their time by placing Wood River properties and in contracting for mining machinery. They have formed a company which is to be operated somewhere near the headwaters of Wood river, that is known as the Union M. Co., of Lacrosse, Wis. The stock is divided into 360,000 shares and placed at $1 per share. It is not on the market, as the Johnson brothers took 50,000 shares at once, and the balance was immediately taken by a few moneyed individuals. This gives a working capital of $300,000, all paid in. A few weeks ago, F. A. Johnson, in behalf of the company, purchased of Fraser & Chalmers, of Chicago, a 20-stamp mill with main shaft and everything ready to attach 20 more stamps. A 150 horse-power Corliss engine of latest improved pattern will furnish the motive power. Everything about the mill will be first-class. It will be illuminated by the Brush electric light. The mill will be completed within 90 days from date of order.

MONTANA.

THE MAIDEN CAMP.—Helena *Independent*, Jan 28: Mr. A. M. Essler, who arrived yesterday from Maiden gulch, gives a flattering picture of the prospects of that new camp. Mr. Essler has charge of Hauser & Holter's mine, the Montana. He states that in the last three weeks, two men have taken out ore to the value of $5,000. The vein in the Montana is 12 ft thick and will average $400 per ton. There are numerous other rich leads discovered, ore from some of which runs as high as $10,000. New discoveries were being made constantly until the ground became covered with snow. The town of Maiden contains at present about 100 houses, with 3 stores and 10 saloons. The Maidenites expect a big boom in the spring, as the fame of the camp is not confined to the Territory, but has reached as far as the Black Hills, from which point it is believed there will be a stampede in the spring Maidenward.

BOZEMAN'S BONANZAS.—*News*, Jan. 28: Bozeman continues to congratulate itself over its prospects for becoming a mining center by reason of recent discoveries in Bridger canyon. There has been a rich silver ledge strike on Bridger creek, 4 or 5 miles from Bozeman. We are informed that the quartz is of a yellowish flint or slatish appearance, closely resembling that of the far-famed Stormont mine, at Silver Reef, Utah. The surface ore assays as high as $82 per ton. The ledge averages from 30 to 40 ft in width, and is well-defined, with a granite and slate formation. J. J. Bennet and other parties are talking of shipping a few tons to Butte to have it thoroughly tested. If the smelter test confirms the result of the assays, this country will have no insignificant future.

UTAH.

MEMORANDA.—Southern Utah *Times*, Feb. 2: The Mamouth No. 2 is situated in Bitter Lake district, about 15 miles north of Frisco, and is the property of Jno. P. Lamotte, and Lindsay & Feeney. The owners are developing the property in a most satisfactory manner. At a depth of 20 ft a 4-ft vein of good grade iron ore, with traces of silver and lead has been uncovered. The True Fissure mine, located on the west side of Grampian mountain, at about the same elevation as the Ern Silver mine, gives evidence of a veritable bonanza. It is owned and is now being developed by J. H. Hedges and the Haskill Bros. The ore croppings on the surface are over 50 ft wide, and steps are now being taken to see what there is below. James Tathum, of Philadelphia, and Charles Tathum, of New York, spent Sunday in camp. They are the owners of the Shauntie smelter and some valuable mines in Star district. During their visit they spent several days in Star district looking over the ground with a view to starting the Shauntle smelter at an early day, provided they can make arrangements for a necessary supply of ore.

Four Rare Trees of Arizona.—No. 2.

[Read before the California Academy of Sciences, by J. G. Lemmon, Oakland, Nov. 21, 1881.]

No. 3.—"Spreading Cone Pine."

Pinus Reflexa, Engel.—The other new Arizona pine has been known for a longer time than *Arizonica*, but so imperfectly, owing to meager specimens and notes of habit, that Dr. Engelmann upon the reception of abundant material, has only this season declared it to be distinct. Whether this conclusion proves correct or not, the tree is one of great rarity and beauty, hence its description cannot fail to interest the Academy and the general reader.

[A communication from Dr. Engelmann, bearing date of Jan. 4, 1882, announces that extensive examination of specimens and notes confirms the position taken that this pins is a distinct new species.—J. G. L.]

History.

This pine has all along been catalogued as a variety of *P. flexilis*, a peculiar species inhabiting the highest and coolest slopes of the mountains of the State of Nevada. This southern tree was particularly characterized by the position taken by the cone-scales; they are always squarrose or reflexed. The characters otherwise agreeing mainly with *P. flexilis*, this was called varity *reflexa*.

As stated, our pine authority has lately raised this southern form to the rank of a species retaining the same name—*reflexa*.

We first met with this tree in the spring of 1881, on the top of Mt. Graham, at an altitude of over 10,000 ft.; also on the highest peaks of the Patagonia mountains. In May of the past season, we found noble specimens of it in the deer park of the Catalina mountains, and in September fine trees were seen on the highest peaks of the Chiricahua range. No doubt nearly all of the high peaks of the southeastern part of the Territory are ornamented by this pine.

Its Near Relatives.

The *Pinus reflexa* closely resembles our magnificent sugar pine *P. Lambertiana*, and, still more closely as to size, the high mountain pine *P. monticola*. It has the same majestic uprise of the trunk, the same reddish-brown, finely-checked bark, the same want of, or shortness of the lower limbs, the same large, long, outreaching upper limbs that give a broad head to the tree; and, lastly, to complete the deception, it hangs its large, long cones, like Chinese lanterns, out from the ends of these arm-like upper limbs. This tree is, in fact, very closely related to the above-mentioned species, so closely that locality, perhaps, is responsible for the slight differences to be soon set forth.

Pines Classified.

Dr. Engelmann, following Endlicher, divides the pine family into two groups or sections, based upon characters of the scales, number of leaves in a fascicle and the condition of their sheaths, as being loose and deciduous, or they are presistent; also upon the characters of the wood, as soft or hard, light or heavy, etc.

One section, *Strobus*, includes those pines whose cone-scales are thin and soft, their exposed portions, called *apophyses*, bearing a marginal boss or umbo at the apex, which is unarmed, *i. e.*, has no prickle. The leaves are always in fives, their sheaths loose and deciduous; the wood soft, white, light, and containing but little resin.

This section embraces our *Lambertiana*, *monticola*, *flexilis*, and the new *reflexa*, described; together with ten Eastern and old world species.

The other section, *Pinaster*, includes those pines whose cone-scales are generally harder, the apophyses, with a dorsal umbo, which is usually armed with a prickle, leaves, 1 to 5 in a fascicle, their sheaths usually persistent; wood, generally harder, heavier, and more resinous.

This larger section embraces our *monophylla*, *edulis*, *Parryana*, *Balfouriana*, *Tarreyana*, the new *Arizonica*, described, *ponderosa*, *Chihuahuana*, *contorta*, *Sabiniana*, *Coulteri*, *insignis*, *tuberculata*, and *muricata*, with thirty-five Eastern and old world species.

Salient Characters.

The *Pinus reflexa* differs from its congeners in the following minor characters, in addition to the salient features given. *Lambertiana* and *monticola* have long-winged seeds, leaves sharply serrate and denticulate at tip, while the new *reflexa* has large wingless seeds; leaves mostly entire and not denticulate; but the most characteristic of the salient features just announced (Jan. 4, 1882) by Dr. Engelmann: "Long-peduncled, cylindric female aments, erect in the first, recurved in the second year, which associate it with the true *Strobi*, while the large winglees seeds distinguish it from the other species of that section."

Added to this is the character first detected, which gives a name to the species, viz., the scales are elongated and the apophyses strongly reflexed. It is these points, principally, that canee this tree to be separated from its nearest ally, the *flexilis*, of Nevada, and give us a new and beautiful tree, well worthy of extensive cultivation—*Pinus reflexa*.

No. 4.—"New Arizona Cypress."

Cupressns Arizonica, Greene.—Lastly we come to the description of a new and charming cypress, of Arizona.

The genus *Cupressus* contains but a few species, all of which are peculiarly distributed. Four or five are found in Central Asia and the Mediterranean region; 3 or 4 inhabit Mexico; two, or perhaps only one species, on the California coast; one on the slopes of Mt. Shasta; one on the island of Guadalupe, off the coast of the peninsula of California, and now one in Arizona.

Most persons on this coast are familiar with the Monterey cypress, and it may be taken as the type of the genus. The trees are peculiar for the light, finely divided branches that give to the foliage that airy, lovely appearance that has caused the cypress to be so generally liked for ornamenting lawns, streets and cemeteries. Also, like the true cedars of the old world, all the species of cypress are very pliable to influence, and hence are trained to form trees of fanciful shape, bowers, screens, hedges, and the like.

One fact is very interesting in this connection, that the flat-topped appearance, or that flattening of the head of each limb into benches, so generally observed of the tree in its original home on Monterey point, is due entirely to the depressing influence of the ocean winds. In the sheltered interior the same tree, if isolated and untouched by the hand of man, assumes a symmetrical cone or spindle form.

The Family of Cypress.

The Monterey cypress was named by Hartweg *Cupressus macrocarpa*, on account of its very large fruit, often over an inch in diameter. In its limited home on Monterey point, the tree has a flattened top, with spreading branches, with dark gray and somewhat rugose or ridged bark. The scale-like, appressed, imbricated, bright green leaves are obscurely pitted on the back, with often a longitudinal furrow on each side. Another cypress from the coast farther northward, including Marin county, is described under the name of *C. Goveniana*, Gor.; but Prof. Watson has lately declared the characters insufficient for separating this from the *macrocarpa*. It is smaller; branches spreading and somewhat pendulous; branchlets, slender; leaves, mostly without the dorsal gland and furrows; cones smaller, with smaller seeds.

The Shasta cypress also found near Clear lake, is *C. McNabiana*, Murr. It is a small tree with numerous short, slender branchlets; leaves small, deep green, somewhat glaucous, with conspicuous pits or glands upon the back; cones very small, with thin, prominent bosses, the upper usually very prominent and incurved; seeds small and very numerous.

A fourth species of cypress is named from the island where found, *C. Guadaloupensis*, Wat. It is a large tree, the bark flaking off in thin plates, leaving a smooth, claret-red surface; branches drooping and very slender; foliage glaucous-green; glands on the leaves, obscure; cones, large, an inch or more in diameter, strongly hossed; with very large seeds, three or more lines long. Already in cultivation in San Francisco, although known only since 1875, and promising to become a desirable lawn tree.

History of the New Cypress.

The last discovery, *Cupressus Arizonica*, was first heard of last year through mesger specimens collected by Mr. Treadwell and sent to Prof. Hilgard of the California University. Here Dr. Engelmann saw them, and from the information that the branches were naked and smooth like manzanita, the Dr. judged them to indicate a new species, and named it *lævicaulis*.

During the summer Mr. Greene discovered it on the high peaks of the San Francisco mountains. He studied it cursorily and published a meager description in the *Botanical Gazette*, under the name of *C. Arizonica*, Greene. In May last, the writer found a dwarfed tree in the Santa Catalina mountains, but could not get good specimens from it. About the same time Mr. Pringle found specimens in the Santa Catalina also, and forwarded them to Dr. Engelmann.

In August last we returned again to Arizona, this time to explore the Chirricahua mountains in the farther corner of the Territory. After varied experiences, hindrances by the outbreak of the Apaches, sickness by overwork and exposure, we found ourselves in September domiciled in the mining tunnel of a hermit of Rucker valley in the south end of the range, and under the slopes of the highest peaks. Soon we were making regular explorations by long trips every third day to some distant mountain and its canyons, the intervening days being necessarily spent in recuperating strength and drying out our collections. Great was our joy when on one of these arduous climbs up a lofty peak, to find on the summit a ridge of over a mile long, thinly clothed with a beautiful cypress. As none had ever been reported from this region, and as we were many miles from the before-mentioned cypress localities, we hoped for an original discovery, and with much labor obtained full specimens of foliage, limbs, fruit, sections of wood, bark, etc., which were forwarded to Dr. Engelmann. He returned the information that the tree was his *C. lævicaulis*, but as Mr. Greene had done the most at bringing out its characters, he must be allowed the honor of naming it.

Its Beauty and Adaptability.

The *Arizonica* is, without doubt, not only the prettiest, but the most pliable of the whole family. We not only found it on this high ridge at an elevation of over 10,000 ft., but also along the streams on both sides at the base of the long mountain on the general level of Rucker valley, at an elevation of about 5,000 ft. Young and old trees were found in both localities apparently alike in robust appearance as if equally at home on lofty peak or in lowly vale.

The young trees are gems of beauty. The twigs are regularly alternate and form, not flat sprays, like the Lawson cypress, but quadrangular pyramids of foliage. The little twiglets are quadrangular by the four even, longitudinal rows of imbricated leaf-scales. These scales under the magnifier are found to have a deep pit on the dorsum, like the Shasta cypress. The trees often attain a hight of 60 to 80 ft., with a diameter of 4 to 6 ft. The upper limbs of large trees hend gently outward, giving a flattened top to the tree. All the limbs shed off their outer bark leaving the inner smooth, reddish-colored, and clouded with lighter spots from which the bark has recently fallen. The trunk of all the trees, old and young, retains its bark, which is grayish, of medium thickness, and disposed in longitudinal ridges, frequently dividing into reticulations that cut the furrows between into diamonds and rectangles. The cones are large—three-fourths of an inch in diameter—the younger ones bearing a boss near the center of each apophysis which is often elongated and incurved like a spur. The seeds are usually triangular from overlapping, and are of medium size. Singularly enough, but few fertile seeds have been detected in the cones we obtained with such care, so it is problematical whether or not the new cypress will soon be in cultivation.

It is but proper to state that Dr. Engelmann writes that he is by no means certain that this Arizona cypress that is so widely diffused, and which has so long remained uncollected, is not identical with some of the Mexican species—a doubt that requires much future exploration and investigation to clear up. But whatever the result, we have the tree over on our side of the line, and it must in future belong to the United States flora, and be frequently described, catalogued and discussed by American botanists. Fortunately, it is very symmetrical, beautiful and tractable; so it becomes a very valuable acquisition to the wonderful products of our coast, and soon—who knows how soon?—we may sit in our own bowers here in the cities of the Great Bay, and yet be shaded by the *Pinus Arizonica* on one side, and the *Cupressus Arizonica* on the other, while we are admiring the growing beauty of rows of *Pinus reflexa* and *Platanus Wrightii* along the street.

[To prevent ambiguity and mistakes, let me add that the popular lawn tree—the "Lawson cypress"—so called, is not a cypress at all, and for that reason has not been described in this article. This tree is at once distinguished by its graceful, flattened or convex sprays of foliage disposed in horizontal plumes or banners.

It is most unfortunate for us who attempt to popularize botanical names, that this lovely tree should be called *Chamæcyparis Lawsoniana*. When we find that to another of our most interesting trees, the "Douglass spruce," the masters have given the unpronounceable name of *Pseudo-tsuga Douglasii*, teachers become discouraged, and the writer heartily joins them in a demand for a shorter, better, more euphonious nomenclature for our trees.—J. G. L., Oakland, Jan. 20. 1882.]

(Concluded.)

Cheap Smelters.

A Chance for a Poor Man.

There are many ledges in this district, notably around Mineral Hill, which carry from 40% to 80% lead, and more or less iron with the spar, thus forming a natural flux for smelting. Such ore has been selected and used to flux ores in other districts.

These may be readily and cheaply smelted in a Mexican furnace, which is made of common clay adobes, or sun-dried bricks. A furnace of this description can be constructed with 350 adobes. It has a small, square chimney, 10 ft. high, and from eight to 10 inches wide on the inside, with a hole, resembling an auger hole, perforating the bottom. This hole is slanting, so that a bellows may be placed on one side of the chimney, and the smelted ore run out on the other side. The furnace is fed through a small hole, about five ft. from the ground. About a quart of ore and two quarts of charcoal are thrown in, alternately, until the chimney is full. Fire is then applied, the bellows set in motion, and the furnace is soon in full blast, acting like a blow-pipe on a large scale. An iron bar, to skim the slag from the metal, is all that is further necessary. The metal can be run out on the ground or into clay molds, when the ore contains much sulphur, which will be indicated by its coarse, bright appearance. The ore must first be slagged. This is done with wood fuel, in a slanting chimney, about 10x15 ft. long, built of adobes. A cord of wood will slag several tons of ore. The chimneys, though small, are surrounded with clay in order to retain the heat.

This process of smelting is very common amongst the Mexicans, and anyone who has seen a *fundacion*, as they are called, can build one, for they are all alike. They have a capacity of about five tons a day, and can be run at a daily cost of $30, for charcoal, wood and labor. We have experimented with one of these furnaces at Willow Springs, four miles from Mineral Hill, where it can be seen by anyone. The pigs of lead run out by us have assayed $130 per ton in silver. The entire cost was about $300, including construction and experiments, which were very successful. Lead is worth at present over five cents per lb, at which price it pays well to ship.—*Pinal Drill.*

Three nuggets, weighing 18, 20 and 58 ozs., were recently found in the Bald Mountain mine dump, Sierra county.

A New Process for Ores.

Says the Denver, Colorado, *Tribune:* The Waitz Mining Co., with their principal office at Silver Cliff, claim to save 90 per cent. of the value of the ores treated. The closed furnace is built upon an incline and arranged in terraces; the ore, previously crushed to about the size of peas (as ore of this size is more readily heated than pulverized ore), is removed from shelf to shelf by automatic scrapers. During the process of heating, said to be accomplished in from forty to eighty minutes, the base metals, are completely desulphurized and oxidized. The latter takes place by means of the conditions under which the ores are treated, viz., in the absence of atmospheric air in the presence of oxygen and in the absence of nitrogen, the oxygen either evolved from the ores themselves, as in the Bowlder and Buffalo Hunter (containing oxides of manganese and iron), or by the addition of some oxygenated substance, should such be lacking. The conditions under which the oxidization of the base metals takes place are not such as to oxidize the noble metals. After leaving the furnace the ore is pulverized preparatory to introduction to the amalgamator. Pulverization is now accomplished with less power and in less time than before heating, in consequence of the disintegration of the ore by that process. Any amalgamator may be used, though Prof. Waitz holds the patent to one consisting of two upright cylinders parallel to each other, and resting on a bed-plate. These cylinders are connected by pipes at top and bottom, the pipes of sufficient size to permit of the passing of the pulp from one cylinder to the other. Within each cylinder are Archimedian screws revolving in opposite directions at a high rate of speed; the quicksilver is placed in the bottom, reaching above the bottom opening; the pulp is placed in each on top of the mercury, so that as the screws begin to work they force the pulp up in one and down in the other, and assisted by the vacuum, produce a sort of rotary motion continually changing the pulp from one cylinder to the other and through the body of quicksilver at the bottom, until discharged into the settler, from this point to be treated in the ordinary manner.

The Waitz process is said to be particularly applicable to the treatment of the sands of placer claims, and will prove an absolutely invaluable auxiliary where water is unattainable. No crushing is needed, the sands being simply put through the furnace and amalgamated and retorted. In reference to the subject, a gentleman from Salida states as follows: "My attention was called to the Waitz process last spring. I saw no immediate results in the tangible reduction of ores; but, as the Professor invested only his own money, sold no stock, nor desired so to do, I became somewhat interested, and visited the little mill at Rosita. I found it incomplete and inconvenient, but upon investigation could not but recognize its simplicity."

Improvements of the Mokelumne River.—Col. G. Mendell, of the corps of engineers, who was sent to examine the Mokelumne river from Woodbridge to its mouth, has just returned the following report to the Secretary of War, which has been transmitted to Congress. That report sets forth that the channel may be put in permanent good condition by an expenditure of $8,250, which would suffice to remove all snags, about 150 in number, clear the banks of overhanging trees, and deepen the shoals near the mouth of the Cosumnes river. It appears from statistics embodied in the report, that about 20,000 tons of wheat, barley, potatoes and other produce are now shipped annually from the Mokelumne river, and it is confidently estimated that 73,000 tons of freight would be shipped by the districts bordering on this river, if the condition of its channel were improved as recommended. Among other things, it is stated that shipments of wood and brick from the south side of the Mokelumne river amount now to 4,600 tons yearly, but with improved navigation will run up to 30,000 tons, as the material for brick-making is the best in the State, and all that is required to develop the business is a clear river.

The Black Knife Mine.—Col. J. B. Nutton, superintendent of the Black Range M. & M. Co., arrived in town Monday evening, on his way to Carrolton, Ill., to consult his company pertaining to their mining intsrests, situated in the Cuchillo Negro mountains, near Fairview. The Colonel brought with him a variety of ore from the Black Knife mine, which is pronounced by men of experience to be the best assortment of argentiferous ores they have seen from that section of the country. From the best information we can obtain, the Cuchillo Negro range will yet prove to be one of the best mining campa in the Territory, and strong hopes are entertained that the Carrolton Co. will at once erect reduction works, as the large amount of ore on their dumps will fully justify them in putting up first-class works. There is no question but what the Black Knife will furnish enough ore within the next six months to supply a two-furnace plant, and that of a high grade.—*Socorro Miner.*

A nugget worth $980 was recently found in the Osceola diggings, White Pine county, Nevada, by some Chinamen. Several years ago a nugget weighing $4,000 was found in this district.

Tanite Emery Wheels.

This solid emery wheel, once offered to the public as a novelty, is now acknowledged as a standard manufacture. In tanite alone is found a base for emery which is at once chemically inert, devoid of poisonous qualities, free from offensive smell, tenacious, without being stony, cohesive, yet not gummiug or capable of being softened by heat, and friable without being brittle. Tanite is also a base which admits of such countless and varied modifications in the general qualities of wheels as enables them to be suited exactly to the most varied and special uses, yet without sacrifice of these general good qualities. The experience of 13 years by the Tanite Co. has brought their manufacture to a systematic basis, and every precaution is taken to secure uniform good quality. The tanite emery wheel is a rotary file which runs a mile a minute, and whose cutting points never grow dull. What the circular saw is to the hand-saw, the tanite wheel is to the file. He who equips his workshope with suitably-mounted emery grinding machines, yokes steam engines to his files instead of men.

We have just received the Tanite company's illustrated catalogue for 1882, and from it extract the following paragraph which explains itself: "The Tanite company was organized in 1868, and though not absolutely the oldest, is among the few old manufacturers in this specialty. During its 14 years' experience it has issued many circulars and catalogues, and for several years published a paper devoted to its own special industry. In 1873 it issued a 124-page catalogue. Now, with increased business and greater variety of goods, it issues an 80-page catalogue. The decreased catalogue is due to the simplification of the business, which has been reduced to a system. Makers and users know what is wanted better than they did 14 years ago. Emery wheels are of better average quality all over America, and being run on machines built for the purpose, are used with greater safety than ever. It used to cost us about $5 to sell a $4 Emery wheel; as the buyer needed a ream of correspondence, many reams of printed matter, and then a visit from a first-class engineer; after which he generally returned the wheel, damaged and used up, with express charges both ways added, and a letter saying the wheel was worthless. Now he writes that he couldn't do without $4 wheels, even if they cost $20 each. The Tanite emery wheel is not low in price, but it is high in reputation. Those who want diamonds, pianos and emery wheels go to Tiffany, Steinway and the Tanite Co. Emery wheels are not valued by their looks, nor diamonds by their weight only. The firms which last are those whose goods have lasting qualities. If you want standard goods, you can get them of standard concerns, and they are generally worth both their price and their repute, even though you and your workmen are too careless to discover it. This company offers its goods at fair prices to fair buyers and careful users. It doesn't have even a single drummer to entice or drive unready customers into unwilling bargains speedily repented of. It carries a stock of goods in almost every large city in the United States (Nos. 2 and 4 California St. in San Francisco), and several in the Old World, and aims to have them considered standard goods by all the dealers in the land."

Cheap Shaft-Sinking for Prospecting Purposes.

In the Pennsylvania hematite regions, the common method of prospecting is by means of small test-pits, sunk through the overlying clays and gravels to depths of from 10 to 50 ft., or more. The Pennsylvania Dutchmen who sink these pits, often become quite expert at the business, and will take contracts at remarkably low rates to sink any depth required, or until bed-rock is reached. In the Lehigh valley, according to Prof. Cook, the contract price for digging such pits up to 50 ft. in depth, ranges from 15 to 25 cents per ft. The peculiarity of the method followed by these prospectors is in the very small diameter of the shaft sunk, ranging from 30 inches to 3 ft. only. A light pick and a spade, with handles about a foot long, are used for the work, and the dirt is hoisted in a small bucket, holding about 50 lbs., by means of a light windlass, which can easily be carried from place to place. Two good men can by this method sink 20 to 30 ft. in a day, and the peculiar skill with which they adapt themselves to their narrow quarters is most remarkable. Up to a depth of eight ft. or more, these human gophers sink without using the windlass, and contrive to throw the dirt clean out of the hole without so much as a pebble falling back on them. These pits, on account of their small diameter, and the care and skill with which they are sunk, apparently need no lining or timber support to insure the safety of the men, whereas larger shafts, sunk in the ordinary way, would have to be timbered, and would cost five to ten times as much. A description of, and notes on, this method of prospecting will be found in the annual reports of the State Geologists of New Jersey for 1872 and subsequent years. Our attention was called to the method by Mr. Wm. Allen Smith, '68, who has had occasion lately to employ two of these Pennsylvania shaft-sinkers in the examination of several hematite properties in this State.—*School of Mines Quarterly.*

Useful Information.

Posts for Barbed-Wire Fences.

A Western exchange says: To render barbed wire a complete success it will soon be necessary to find some substitute for the common wooden post. The kinds of wood that are suitable for fence-posts are somewhat rare, and are becoming scarcer every year. Cedar is the favorite wood, but the demand for it for other purposes is rapidly increasing, while nothing is being done to increase the supply. Cedar trees are of very slow growth, and it appears to be impracticable to raise them for industrial purposes. Cedar is now in active demand for paving blocks, telegraph poles, ornamental ware, and various other purposes. The attempt has been repeatedly made to use living trees for supports for wire employed in the construction of fence, but in the majority of instances it has been unsuccessful. The trees are not in the line where the fence is required, and it is the work of many years to produce them. The wire soon becomes imbedded in the wood and rusts. Posts made of clay burned like bricks, and of concrete, have been used to some extent, and have been quite successful. They are, however, heavy to transport, liable to be broken, hard to set in the ground, and easy to be lifted by frost. Stone posts are open to all these objections, but they may be used to advantage in many places where stone easy to split is found in the vicinity. Stone posts have been used for a century in some of the Eastern States. A hole is made to hold a nail or staple, and is closed by the use of lead or sulphur. The most promising material for posts for supporting barbed wire appears to be wrought iron. It is strong, cheap to handle, and easily shaped into any form desired. By cutting slots in one side the wires may be fastened in them and the use of staples obviated.

Electrical Sheep Shears.

Mr. Edison has received a communication from New Zealand, in which the writer sets forth at length the pressing need of some means of shearing sheep evenly, rapidly, and without risk of hurting the animal. Sheep raising, it will be remembered, is most largely carried on in sparsely inhabited districts, where skillful shearers are hard to get.

The writer appeals to Mr. Edison, thinking that an electrical apparatus might be made to answer, the cutting to be done by means of a wire highly heated by an electric current. The length of the heated wire or cutter would have to be about three inches.

The use of an incandescent wire of platinum for cutting has been entirely successful in surgery, in removing tumors and other diseased or morbid growths, and there is a possibility that it might answer for cutting wool. Whether the heated wire would injure the wool, or whether the accumulation of ash would speedily make the cutter inoperative, are questions which trial alone can decide.

Some years ago patents were taken out for a method of felling timber by the use of wire electrically heated, but when the method was put to practical test it failed, as the ash of the burnt wood soon surrounded the wire with a fire-proof shield.

Whether a similar difficulty would arise from the coating of the wire with wool ash and charred wool on applying the method to wool cutting, and whether this or other possible difficulties can be easily overcome in an electrical shearer, can be determined only by trial.

A Street Car which Carries Its Track. The Accommodation Car Co. has begun operations here with a capital stock of $1,000,000, divided between the patentee, T. T. Prosser, and F. F. Cole, a real estate man. The object of the company is to build and equip a thousand cars and put them upon the streets of Chicago. The car is the patent of Mr. Prosser, and as regards present appearances is a queer, ogle-some-looking craft, which carries its track along with it, and to all intents and purposes is designed to traverse any and all lines of streets. The car, which is of the ordinary kind, is mounted in the middle upon a truck which sits on four wheels, each about one foot in diameter, and which rest upon the ground, and are only held to the car by a set of wheel clamps. The car is designed to hold 50 people, and the owners claim that the more it carries the easier it runs. It will be stopped in the usual manner, and two horses will be required to pull it. The owners say they intend putting the cars upon the principal streets of the city and placing the cash fare at four cents and selling 30 tickets for $1.—*Chicago Times.*

To transfer a photograpic print to glass for painting or for other purposes, separate the paper print from the background by steaming it; dry thoroughly, and having given the warmed glass an even coating of clean balsam or negative varnish, place the face of the print on the surface thus prepared, smooth it out, and let stand in a cool place until the varnish has hardened. Then apply water, and with a soft piece of gum-rubber rub off the paper so as to leave the photographic image on the varnished glass.

Electric lighting is in successful operation on more than 60 steamers of the Mississippi river and its tributaries, and is believed to add much to the safety of traffic and travel.

The fusibility of soft solders is increased by adding bismuth to the composition. An alloy of lead 4 parts, tin 4 parts and bismuth 1 part, is easily melted; but this alloy may itself be soldered with an alloy of lead 2 parts, bismuth 2 parts and tin 1 part. By adding mercury, a still more fusible solder can be made. Equal parts of lead, bismuth and mercury, with 2 parts of tin, will make a composition that melts at 122° F.; or an alloy of tin 5 parts, lead 3 parts and bismuth 3 parts, will melt in boiling water. In mixing these solders, melt the least fusible metal first in an iron ladle; then add the others in accordance with their infusibility. To cast strips of solder, pour the molten metal on a flat surface of stone or metal, drawing the ladle along the while, to leave a thread of metal of the desired substance.

Improved Tin Cans for Preserved Foods. It is stated that a very simple and neat improvement has been effected in the preparation of the tin cans now so extensively used for preserved foods. The body of the can has a bayeled rim, upon the slope of which the cover is soldered. When the cover is smartly tapped round the edge, it is expanded, and the solder joint broken by the wedge action of the bevel. The can is thus opened without injury to the lid, while the present inconvenient and even dangerous process for cutting open these air-tight cases is entirely avoided. The improvement involves no additional cost, and the soldering is applied externally.

A Fire-extinguishing Powder.—A London inventor claims to have devised a fire-extinguishing preparation which can be kept in powder or in solution, and asserts that it is not only more speedy and effectual in action than water, but that nothing, once sprinkled with it, will ignite.

Good Health.

Malarial Organisms in the Blood.

In the blood of patients suffering from malarial poisoning, M. A. Laveran has found parasitic organisms, very definite in form and most remarkable in character. Some were cylindrical curved bodies, poised at the extremities, with a delicate outline and a transparent body, colorless except for a blackish spot in the middle, due to pigment granules; on the concave side a fine line could often be traced, which seemed to unite the extremities of the crescent. These bodies presented no movement. Spherical organisms were also seen, transparent, of about the diameter of a red blood corpuscle, containing pigment grains which, in a state of rest, were often arranged in a definite circle, but sometimes presented rapid movements, and then lost their regular arrangement. On the borders of the spherules very fine filaments could often be perceived in rapid movement. These filaments were in length three or four times the diameter of a red corpuscle. Their number varied. Sometimes three or four were seen around a spherule, to which they communicated an oscillatory movement, displacing the adjacent red corpuscles.

There were also bodies of spherical or irregular form, transparent or finely granular, about the hundredth of a micro-millimeter in diameter, containing dark red, rounded pigment grains, either regularly arranged at the periphery or aggregated at some part of the spherule. The bodies and granules were both motionless. These appear to be the ultimate or "cadaveric" stage of those last described. They have no nuclei, and do not tint with carmine. Lastly, spherical elements were met with similar to those already described, but much smaller in size, and apparently representing a stage in their development. The animated nature of the mobile pigmented spherule, furnished with filaments, appears indisputable. Besides these organisms, the blood of patients suffering from malarial fever contains: 1. Red corpuscles, which appear to be vacuolated at one or two spots and contain pigment granules. 2. Pigmented leucocytes. 3. Free pigment granules, possibly proceeding from the destruction of the parasitical organisms.

These elements were first discovered by M. Laveran about a year ago, and since then he has examined the blood in 192 patients affected with various symptoms of malarial poisoning, intermittent and continued fever, and palustral cachexia, and found the organisms in 180. The disease had been contracted for the most part in different regions of Algeria and Tunis. He convinced himself, by numerous and repeated observations, that these organisms are not to be found in the blood of persons suffering from diseases that are not of malarial origin. In most of the cases of malaria in which the examination yielded a negative result, the patient had undergone a course of treatment with quinine, and to this fact the absence of the organisms from the blood was probably due. The addition of a minute quantity of a dilute solution of sulphate of quinine to a drop of blood was found at once to destroy the organisms. In all the examinations great care was taken to preclude the entrance of any extraneous objects into the drop of blood examined.

In general the parasitic bodies were found in the blood only at certain times; a little before, and at the moment of, the accession of the fever. In some very obstinate cases the organisms were always present in the blood. They rapidly disappeared under the influence of a quinine treatment. It is conjectured that in the apyrexial intervals the organisms probably sojourn in internal organs, especially the spleen and the liver. After death from malarial disease pigment granules are found in great numbers in the blood, and especially in the small vessels of the spleen and liver; and they may be, in the most severe cases, so abundant that not only the spleen and liver, but the marrow of bone, and even the gray substance of the brain, are darkened by their presence. These pigment granules, which may obstruct the capillary vessels, appear to be derived from the parasitic elements, which perish after death, and become then unrecognizable.—*Lancet.*

Precautions Against Small-Pox.

It would be useless to deny that this disease has become epidemic in many parts of the United States, and is gradually spreading. Thus far Illinois has been the greatest sufferer by the disease. It is said that it has made its appearance in most of the counties of the State. Perhaps our physicians will find a hint in the following article, which we copy from the Philadelphia *Record:*

Many deaths from small-pox may be prevented by knowing how to treat the disease. A gentleman in this city found that a child of his, one with two good vaccination marks, had small-pox. The child was immediately placed in an upper room, which had been stripped of everything but the bed and bedstead, a chair and small table. The father took charge of the child, attended to everything; no one else was allowed to come on that floor; food was left in the second story hall, which the attendant, after washing his hands in carbolic soap, transferred to other dishes, which were washed and disinfected in the sick room. Nothing touched by the patient was allowed to go down stairs; all the slop was thoroughly disinfected with chloride of lime, carbolic acid and sulphate of iron; soiled clothing was covered with chloride of lime and immediately burned in the furnace. When the patient was well the bedding was sent to the small-pox hospital, the room thoroughly scrubbed, and the walls and floor wiped over with a solution of carbolic acid in water, just so weak as not to change the color of the wall paper. Then a good strong earthen vessel was placed in the room and about half a pound of chloride of lime put into it. On this was poured a half a pound of muriatic acid, and the door immediately closed. The chlorine gas thus generated permeated every crevice in the room. This was done three times a day for several days, the adjoining rooms being also filled with the gas. The result was, that with a large family, small-pox all around and many fatal cases in the neighborhood, no other member of the family had it, and that room is just as free from small-pox taint as if the disease had never been there.

A New Dental Disease.—A child, aged 10, whose teeth six months ago appeared to be all perfectly sound, came to me with toothache in the right lower canine. I found that a large portion of the enamel had disappeared from the front surface of the tooth, as if it had been chipped violently off; the dentine was all exposed, but there was no softening or appearance of decay. The disease, which has commenced in several of the other incisor teeth, appears first as a small white spot in about the thickest part of the front surface of the enamel, which it seems to penetrate; and then, suddenly disintegrating, this comes away, and exposes the remaining enamel and the dentine. This disease is altogether a different thing from the gradual decay, or wear at the neck of the teeth, frequently met with in adults, for in this case the patient is only 10; and, as far as I have been able to ascertain, the incisors and canines never have been known to decay in the manner above described. We are often at our wit's end to cope with the increasing prevalence of caries in the teeth of the very young; and if this be (as I fear it is) a new form of destructive energy, the sooner it is recognized the better.—*N. Stevenson, British Medical Journal.*

Substitute for Cod-Liver Oil.—It is claimed by a writer in *Nature* that the oil of the "oolachen" or "ulikon," the candle-fish of Alaska, possesses all the medicinal qualities of cod-liver oil. This fish has long been an ichthyological curiosity, and has been noticed by almost every traveler who has visited the coasts of British Columbia and Southern Alaska. It is a small silvery fish, averaging about 14 inches long, and in general appearance much resembling a smelt. It is the fattest of all known fish, and affords a very superior oil when tried out. Dried, the fish serve as torches. When a light is needed, the tail is touched to the fire, and they will burn with a bright light for some time. No description can give an adequate idea of their numbers when ascending the rivers from the sea. The water is literally alive with them and appears to be boiling. These fisheries appear not to have been hitherto utilized except by the natives, who esteem the ulikon as a great delicacy. The oil at present is said to be gaining a high reputation in this country, and has recently been introduced into England, where it will probably take "a prominent place as an important medicine."

During November there was mined at the Blossburg collieries, N. M., 2,941 tons of coal, and at the Savage collieries, 2,693 tons, making the total output of the Raton Coal and Coking Co. for the month, 5,406 tons.

Passing Events.

Although there have been indications of rain several days during this week in this region, up to the present writing (Thursday) none has fallen. In the mountains the weather has been quite cold and has greatly interfered with mining operations.

It will not now be many weeks before prospectors will begin to go out again into the mountains as the sun is fast climbing north and lengthening the days. The coming season promises to be a lively one, as a great interest has developed in mining matters, and the area in which mining is carried on is being rapidly widened.

Further news from the Jeannette expedition this week gives some of the details of the cruise and announces that some of the men are on the way home. No tidings, however, of the brave leader of the expedition have been received.

MICA.—A mica mine at Deadwood is said to have been sold for $37,500. It has an immense ledge, and over 10,000 lbs. have already been shipped. There are many dozens of mica mines in this State, but no one even made $3,750 out of one, much less $37,500. The North Carolina mine, which produces such excellent mica, yields enough to supply the United States. As one company has a monopoly of the handling of this product and owns this mine, there is not much encouragement for others to open mines. It is only first-class clear mica, which comes in large sheets, that can be marketed.

HENRY G. HANKS, State Mineralogist, has sent a communication to the Board of Education inviting the board and the teachers to avail themselves of the privileges afforded by the State Mining Bureau.

Geology and Juries.

It is a very common thing in the trials of mining suits for a mass of testimony to be introduced regarding the cause and manner of the formation of mineral veins or deposits. In doing this a few experts are enabled to air their geological knowledge, bring forward their pet theories, and endeavor to prove that because the Lord Almighty made one or two mineral veins or deposits with which they are personally familiar, in a certain way, all other mineral veins or deposits must be also made in the same way. If they are not made in this way, then they are not mineral veins or deposits, but something else not known to geology, and therefore not to be considered.

The technicalities of any profession are confusing to any one not of that profession. We can scarcely, however, conceive anything which could be more confusing than a geologist's description of geological features to a set of men with no knowledge of geological terms. Yet juries have to stand hours and hours of such talk, which even the lawyers hardly understand.

That a great deal of time and talk is wasted in trials of this sort, there is no doubt; and that it does much good is also a subject of doubt. It has remained for an Arizona judge, however, to officially discountenance the practice, by stating that the jury have more to do with the veins themselves than with theories as to how they were formed.

In the recent Contention-Head Center suit at Tombstone, the defendant asked Judge Stillwell to give the following instruction to the jury:

"If the jury find from the evidence that after the porphyry dike existed, a fissure was made in the dike and adjacent rock with defined walls and clay selvages, and that the fissure was filled with ore of gold and silver, and that from this fissure at certain points the adjacent porphyry and shale was mineralized, they should find this fissure a vein, lode or ledge within the meaning of the act of Congress."

And the judge on giving his charge to the jury, said:

"I cannot give you that instruction, gentlemen, for the reason that I am not of the opinion that it makes much difference as to when or how the fissure was formed, and your opinion and verdict better be based upon what miners consider veins, ledges and lodes when they find them, than upon a theory or conjecture as to when or how it may have been formed."

Locking Miners' Lamps.

Before safety lamps were invented the loss of life in coal mines from explosion of fire-damp was frequent and great. After the lamp was devised and put into use, this was lessened, but it was found that explosions frequently occurred even then. Strict regulations were enforced against the men taking matches into the mine, but still explosions occurred. It was then found that the men would unfasten and open the lamps, notwithstanding they risked their own lives and those of their fellow workmen in doing so. The lamps were locked, but the locks were picked by the miners. All sorts of devices have been tried to keep the lamps securely locked, but as many ways for overcoming the precaution have been got up by the miners.

It seems strange, but it is none the less true, that the men cannot be trusted in this matter, and that so much trouble must be taken by the mine owners to save the men's lives; and that the main danger comes from these very men themselves. The men will evade the laws and the company's regulation and risk their own lives for a surreptitious smoke, taking the chances of an explosion. Of course all miners are not so reckless, but enough of them are to make it necessary to exercise every precaution to prevent the men getting at the flame of the lamps.

For this reason Schondorf's locking arrangement for miners' lamps is finding extended application in Saxony. In Schondorf's lamps a locking pin is used which cannot be got out of its place by any external means within the miner's reach, but only by a powerful magnet. As a horseshoe magnet of sufficient power for this purpose weighs about 8 lbs, or 9 lbs., and costs about $10, it is not likely that a miner will carry one in his waistcoat lining or boots, or invest the money for a surreptitious smoke. This is the newest thing, and it remains to be seen how the miners are going to get away with the magnet.

TWENTY-FOUR PAGES.—The San Francisco MINING AND SCIENTIFIC PRESS last week consisted of 24 pages, and our readers are reminded that this number is one worthy of preservation for future use. Its annual review fills nearly five closely printed pages, and it gives in a comparatively brief space a resume of the condition of the mining industry over a very large territory. It has compiled, also, such statistics of bullion production, etc., as will be interesting in this connection. The latter work shows a great deal of information in a brief space. Although the review may seem somewhat extended, it is really brief, when the ground covered by it is considered.—*Inyo Independent.*

Fuel for Blowpipe Assays.

In making assays with a blowpipe, when more convenient material is not at hand, stearine candles of good quality will answer for most purposes. Parrafine candles give a higher heat, but they soften in warm weather, and melt and run down inconveniently. The common tallow candle may often suffice in an emergency, but requires constant snuffing.

Brush, in his "Determinative Mineralogy and the Blowpipe," gives a preference, when gas is not procurable, for olive or rape-seed oil, burned in a lamp having a single circular wick rather more than a quarter of an inch in diameter, if the wick tube or lamp be so arranged that the charcoal or other supports used in blowpipe experiments can be brought close under the deflected flame.

The form of blowpipe proposed by Berzelius, and improved by Plattner, is well adapted for a portable blowpipe apparatus, since it is free from leakage and capable of packing into a small space. The cistern is of tinned sheet iron, and the wick tube and filling orifice are closed by screw caps.

The most convenient combustible is, of course, illuminating gas. The burner, about four inches high, is convenient; the tube is flattened at the top, and made a trifle lower on the left side, so that the blowpipe flame may be turned downward when necessary. A cock in the tube at the foot is useful. Such a lamp has the advantage of dispensing with all trimming and other inconveniences attendant on the use of an oil lamp. The ordinary Bunsen gas burner is often provided with an extra tube to slip over the small gas jet in the interior of the burner in such a manner as to shut off the access of the air; the gas is then burned from the upper end. The only objection to this lamp is, it is a little too high, although it may answer for all ordinary purposes.

A simpler blowpipe gas lamp may be easily made by selecting an iron or brass tube, eight inches long and three-eighths of an inch bore, bending it at a right angle at the middle, and passing it through a block properly cut, or placing it in a small circular mold for a base, which is then filled with melted lead. The top of the tube is then flattened, and the proper inclination given to the orifice by filing.

Mining Boats.

We have several times mentioned the fact that the different mining boats, vacuum dredges, pumps, etc., tried for raising the gold from the bottom of our California rivers, have all proved failures. Hundreds of thousands of dollars have been expended in the experiments by people sanguine of success, and who have ignored the experience of others.

To show that this experience is ignored, the following paragraph from an Eastern paper is given: "A new system of gold mining has been introduced in Georgia, what is called a vacuum dredging boat having been successfully tried on the Chestatee river. It is designed to raise the gravel from the beds of the rivers, washing the sand and separating the gold from it. At a recent trial the boat raised the sand by the vacuum system at the rate of from two to four tons every five minutes. The sand was rapidly washed automatically in sluice boxes and the gold collected in quicksilver. As the result of three hours' work, $200 worth of gold was secured. The expense was not more than $12. The sand was found to be very rich, and it is said there is enough in the rivers in Georgia to keep 50 boats busy for 50 years."

As a commentary on what the result of this will be, we give the following item published the same week as the above, but this is from the Gridley (Butte Co. Cal.) *Herald:* "Many of our readers will remember the mammoth mining boat constructed upon the Shaeffer & Parks ranch several years ago by the Newton Hydraulic M. Co. The craft and machinery cost in the neighborhood of $45,000. After sinking between $80,000 and $90,000, the projectors of the scheme became satisfied that the gold in the bed of the Feather river could not be extracted after that fashion, and operations were suspended. The machinery was taken off and the hull abandoned. A short time since L. P. Denny of this city bought the boat and now has a gang of men at work tearing it to pieces and saving the lumber."

Any gentlemen East who are going into mining the beds of rivers, and are going to use boats in their search for gold, had better find out something of the history of this kind of mining first. Then they had better watch experimental trials carefully. These boats generally pump more money out of the stockholders' pockets than ont of the river beds.

THE Trinity *Journal* publishes a statement that makes a showing of $437,779.50 gold dust and bullion shipped by express from Trinity county during 1881, and thereupon makes the following remarks: As the gold bullion and gold dust passing through the express office in Weaverville exceeds $400,000, and this is fairly estimated at about one-half the production of the county, the entire gold yield for the year 1881 may be reasonably estimated at double that amount, or $800,000. This amount is a splendid showing for a county of less than 5,000 population, including Chinese.

Boss' Continuous System for Working Ore.

In all the history of amalgamation the principle has been to produce contact between the ors and quicksilver (after preparatory chemicals, if used).

It is an unfailing principle that gold and silver will amalgamate when brought into healthy contact with quicksilver.

To bring about this contact our Spanish-American neighbors, by the patio, produced a very slow and incomplete contact and waited for the action of time to complete the work. The arastra was quicker, keeping a constant, but very moderate, agitation.

The "Washoe pan" was an improved arastra, working quicker and having more working surface. It was a long stride ahead. That, in its earlier days, did its work almost entirely between shoe and die. The pulp was necessarily thick to carry quicksilver and heavy particles in suspension throughout the mass, that all might take its regular turn in the activity between the working surfaces.

In course of time the "Washoe pan" improved in its efficiency. The contact of particles was made vigorous throughout the pan. This was attained by making the current proper and powerful and the pulp thin. By this, no sluggish grains of ore rode quietly around near a head of quicksilver. Attrition, friction, contact, business in active throughout the mass.

When pulp was required thick for the pan, it was necessary to settle it in tanks, but now, when pans are to be had that will handle the thinnest and heaviest pulp without concentration at the bottom, it is wholly unnecessary.

The continuous system of working ore, by which all the pans and settlers are connected, and the pulp from battery run directly into the first pan, which overflows into the second, and so on through them all, the quicksilver running into and out of the pans separately from the pulp, is no radical change of the working within the pan. It simply requires that pans and settlers be up to the standard of the day that no concentration take place within them. The business within the pan is the same, except that the individual particles of pulp, instead of remaining in one pan to receive all of its action, pass in turn throughout them all, having the advantage of being of lower grade, and meeting with fresh quicksilver in each succeeding pan. With an ore proper for amalgamation, there can arise no question whether this system can work it.

In a milling proposition the question does not arise, is this system suitable for this character of ore? But how many pans are required for working a given amount of this ore? The system was first put into operation at the Noonday mill, in May, 1880. It has been in constant use there from that day to this, giving fullest satisfaction in its labor saving, working percentage and small loss of quicksilver. In every mill in which the patentee has personally introduced it, and in every mill that has observed his ideas of pans and settlers, it has been an unceasing success.

PACIFIC COAST STEAMSHIP CO.—The stockholders of the Pacific Coast Steamship Co. met on the 6th of February and elected the following officers: Directors—Charles Goodall, C. H. Prescott, John Rosenfeld, William Norris, George C. Perkins, J. L. Howard and Edwin Goodall. The Directors met on the next day and elected the following officers: President, Captain Charles Goodall; Vice-President, John Rosenfeld,; Secretary, Edwin Goodall; General Agents, Goodall, Perkins & Co. It is quite a mistake to suppose that the change of officers will take any business away from San Francisco. In relation to the supposed change of ownership Governor Perkins says: "It is true that Henry Villard now holds the controlling interest in the stock of the company, but the management is in precisely the same hands and the business will be conducted nearly in the identical manner that it has been in the past. The firm of Goodall, Perkins & Co. remain the agents, and though the main offices will in future be located in Portland, that will make no difference to the nature and amount of business transacted in San Francisco. Goodall, Perkins & Co. are also the agents for the Oregon Railroad and Navigation Co."

SAFETY FIRE ALARM.—A great fire was doubtless obviated in the Baldwin hotel of this city this week by the automatic fire alarm. Wires from this electrical fire announcer are laid in every room. Should the temperature in any place raise above a normal state, an alarm is sounded in the porter's room and the office, and the locality of the unusual heat is also indicated. In this case the fire occurred at four o'clock in the morning up under the roof directly over the Baldwin theater stage, in the hotel. The alarm rang and called the attention of the night watchman. All the employees were aroused, and with three streams from the hotel hose the incipient conflagration was checked. A simple invention thus saved large loss of property.

SINCE the Bullionville furnace shut down, the Pioche *Record* says, the town has relapsed into its former quietness, and all it requires now is a large-sized shroud to bury her out of sight.

The Art of Firing.

[Written for the Press by C. H Aaron.]

The writer, when in charge of quartz mills, has a number of times gone into the boiler-room and put the steam up to the required pressure, when the engineers confessed their inability to do so. It is true these engineers were not men of high-standing in their profession, but they were such as it is often necessary to employ in the mines at least, and very good men on the whole. One in particular was agreeable, intelligent, industrious and conscientious, and, though not a machinist, had been engaged as a "runner" of engines from boyhood, and could put an engine into excellent working order and keep it so. The draft was not very strong, and the interior walls of the furnace had fallen, leaving a cavern under the boiler in which nearly half a cord of wood might be placed; the distance of the grates from the boiler was greater than it should have been, and there was neither time nor material for alteration or repair, the engine having been called on merely as an adjunct to a water power which was diminishing day by day.

At last it became necessary to do the work entirely by means of the engine, which required at least 40 lbs. of steam pressure, and then this excellent man declared, while the sweat poured from him, "It's no use, Mr. ———, I can't keep up steam."

It would have been unjust to blame him, for the circumstances were certainly disadvantageous, and he had evidently tried his best. He was requested to go to the shop and repair the blower for the tubes, which was out of order, the writer taking his place at the engine. The water in the boiler stood between the second and third try-cock, the steam gauge indicated something less than 30 lbs. The furnace was full of fuel, fresh wood at the top and a thick bed of coals on the grate; the boiler plates were covered to the thickness of half an inch with black soot, with which the tubes were also lined; a dense column of black smoke poured from the stack.

In the course of 20 minutes the engineer returned in search of some tools, or perhaps to see how things were going. He found three gauges of water, and 40 lbs. of steam pressure. In another 20 minutes he returned again, with his blower ready for the tubes, and found three gauges of water, and 51 lbs. of steam pressure, his substitute being as cool and comfortable as though he had been sitting in a parlor, instead of running a 60 horse power engine. In fact, beyond putting in a very small quantity of wood toward the last, the substitute had done absolutely nothing, except attending to the feed and throwing the fire-doors wide open, until the smoke from the stack began to clear, when they were first partially, and then completely closed. The soot had all disappeared from the boiler plates, and but little remained in the flues. A thin layer of coals covered the grates; the newly introduced wood was burning brightly, and the smoke was barely visible. "By the gods, you can beat me at firing!" was the engineer's remark, but thenceforward he had no trouble in making all the steam required. He had thought it necessary to keep that immense furnace stuffed full all the time, in order to bring the fire close up to the boiler. He had wasted a large quantity of wood, a great part of which had gone up the stack, in the form of smoke and gas—had exhausted himself by sweating and toiling, and had not been able to keep 30 lbs. of steam pressure.

The man, being intelligent and not disdaining instruction from even a "scientific cuss," heard and profited by a short lesson, somewhat as follows, on

The Philosophy of Combustion.

A given quantity of fuel requires a certain quantity of air to enable it to burn. The quantity of air which can pass through a furnace depends on the ease with which it can enter, and the force of the draft; and the draft is limited by the form and dimensions of the flues and stack, or chimney, and the difference of temperature between the interior of the stack and the external air. Carbon, as coke or charcoal, in lumps, that is, the "coals" which are formed in a fire of wood or coal, burns only on the surfaces of the pieces, the inside portions remaining unchanged until exposed by the gradual burning away of each piece. Wood and coal contain not only carbon, but also substances which, when heated, expand into gases, most of which are combustible, but which require a certain degree of heat to ignite them, and a certain proportion of air to enable them to burn.

The conversion of the volatile substances in the fuel into gas absorbs a great deal of heat; and if the fuel contains a little moisture, as it generally does, the moisture is converted into vapor, also absorbing a great deal of heat. When wood or coal is thrown into a hot furnace, the first effect is to cool the furnace, not only because the fuel is cold, but also because of the expansion of the volatile matters into the gaseous form. As soon as the gases become sufficiently heated, they will burn if air is supplied, and will then produce heat; but if not sufficiently heated, or if air is lacking, they cannot burn, and they go up the chimney in the form of smoke, depositing soot, which is carbon in powder, upon the boiler, in the tubes and in the stack. Soot is one of the worst conductors of heat known, so that the evils resulting from a failure to burn the gases are many. Firstly, the heat which they would produce if burned is lost. Secondly, the heat which they absorbed in their expansion is lost. Thirdly, the soot deposited in the flues obstructs the draft and thus diminishes the possible amount of combustion in the furnace. Fourthly, the soot coating the boiler plates and the inside of the tubes tends to prevent heat from passing to the water in the boiler.

From the foregoing it is plain that if a large quantity of fresh fuel is thrown into a furnace at once, some time must elapse before the gases evolved can become hot enough to burn, even if air is present in sufficient quantity; but, besides this, the large volume of gas produced tends to fill the furnace and flues, supplying in a great measure, or even entirely, the demand of the draft, which, moreover, is diminished by the cooling effects described; thus little or no air can enter, and all the evils mentioned follow of necessity.

It is almost impossible, unless with the best and dryest wood or coal, to fire without producing some smoke, but to prevent this as much as possible the rule for the addition of fuel is, *a little at a time*, and then no more until that in the furnace is in active combustion. In this way it will soon be known how much fuel can be accumulated in the fireplace with good effect. The fireman should watch the stack, and as long as a heavy smoke comes from it, the further addition of fuel will be worse than useless. When the smoking ceases, more fuel may be added if required, but a too thick bed of coals on the grate does harm by obstructing the passage of air.

The Perfect Combustion

Of fuel produces no visible smoke, yet the absence of visible smoke is not a proof of perfect combustion in all cases. The perfect burning of coke or charcoal makes carbonic acid gas (carbon dioxide) which cannot be further utilized, but the imperfect combustion, caused by a deficiency of air, makes carbonic oxide (carbon monoxide), an invisible but combustible gas which burns in presence of air with a purplish-blue flame. When the bed of coals on the grate is too thick for the quantity of air passing through it, perfect burning takes place at the bottom with a great development of heat, but the carbonic acid gas thus formed, in passing through the red-hot coals, undergoes a reversal of combustion, so to speak, takes up carbon, losing heat in so doing, and is converted into carbonic oxide, and there may be a loss of heat and a waste of fuel in this way, without any visible smoke.

If Air be Admitted

Above the fire, this gas will burn and produce heat; if not, it goes up the chimney unburned. If fresh fuel is thrown in while the furnace is full of this gas, and there is no air to enable it to burn, it is clear that the gas from the fresh fuel must also be lost, and smoke produced. On this account ventilators are usually placed in the fire doors, in order that some air may be admitted above the fire in case that not enough of it can pass through.

Too much air, though not so bad as too little, is injurious by needlessly reducing the intensity of the heat. For this reason, the ash-pit has doors which may be partially or wholly opened at pleasure, and with ventilators, as well, generally. The fireman should so regulate the damper as to have rather more draft than is generally required, and then control the access of air below the grate by means of the ash-pit doors and ventilators, and above the fire, by the ventilators in the fire doors, so as to obtain, as nearly as may be, perfect combustion, and at the same time, the highest possible heat with the least possible consumption of fuel.

The quantity of heat produced depends upon the quantity of fuel which is completely burned, but the intensity of the heat is in proportion to the quantity of fuel completely burned in a given time and space; and space must be considered to include not only the dimensions of the fireplace, but also the volume of air which passes through it in the given time, because all of this air must be heated. The more intense the heat, the larger the proportion of it which passes into the water in the boiler. We might burn a hundred cords of wood under a boiler and not make the water boil, if it took a week to each cord; or a cord a minute, in as little purpose, if the fireplace were as large as the Palace hotel, or if a great excess of air rushed through the fireplace, because, in either of these cases, though the same quantity of heat would be produced, it would never acquire sufficient intensity beyond the immediate surfaces of the burning particles.

The above principles are applicable to the management of roasting furnaces and the domestic stove, as well as to firing under a steam boiler, and many housewives would save both trouble and expense by giving some attention to them. Water can be heated much faster in a kettle with a clear bottom, than in one which is thickly coated with soot, and a clear burning fire will afford more heat with less fuel than a smoky one. When a stove is too hot, the draft should be checked, chiefly at the bottom, instead of in the pipe, and some air admitted above the fire.

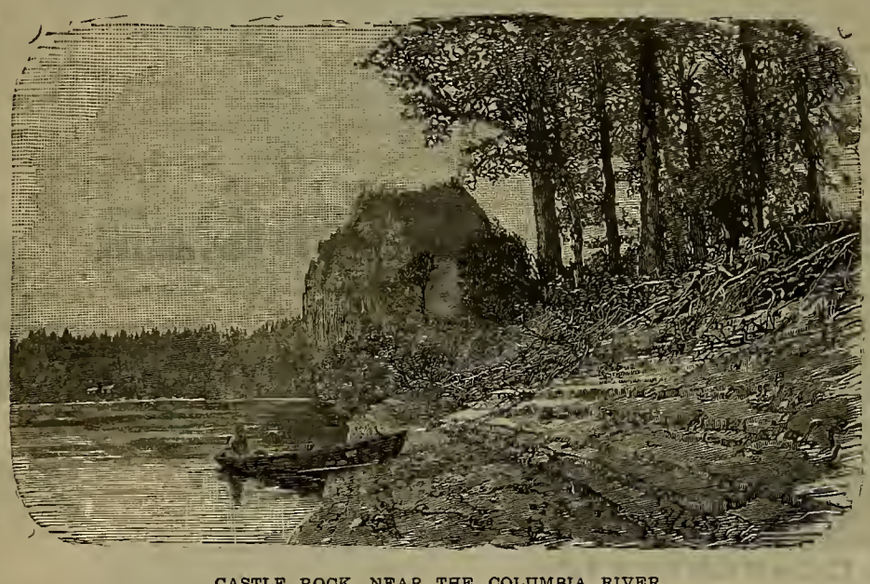
A Scene on the Columbia.

We give our readers this week another glimpse of the enchanting scenery of the Columbia, the majestic river of our northwestern region. Along the northern line on the Columbia river, says a writer in the *Resources of Oregon and Washington*, may be found some of the grandest scenery in the known world. It is here that we find solemn old Castle Rock, nestled among the willows and dogwood of Washington Territory, covering 13 acres of land and towering above the water's edge for over 800 ft. It is the property of Jay Cooke, of New York city, and doubtless excites a feeling of pride within him as he looks back through the veil of the past, and as memory joins hands with imagination he sees coming generations pass up and down the Columbia—this great thoroughfare of the west—and Castle Rock is accorded the pride and admiration of a great nation. Not only is it grand of itself, but it is in the midst of scenery most sublime. Above it are the lower rapids of the Columbia, seething, whirling and boiling as the water comes rushing over the rocks. Below it stands the symmetrical Rooster Rock, standing alone and reaching above the water's edge for 300 ft. Below this, Lower Cape Horn stands boldly out in the river, and presents an unbroken front of basalt 300 ft. high, worn by the overdripping streams of water until the grooves and hollows present a scene both picturesque and sublime.

The time was, and in the memory of our fathers, when no land was so distant, so forsaken as this. Bryant, in casting about for an example of utter desolation, exclaimed:

> "Take the wings
> Of morning, pierce the Barcan wilderness,
> Or lose thyself in the continuous woods
> Where rolls the Oregon, and knows no sound
> Save his own dashing."

Now, however, the deathly stillness that once reigned supreme, is broken by the noise and clangor of busy craft hurrying from point to point in the interest of commerce, while along the shores hundreds of men are blasting and drilling, preparing a course for the iron horse, that in so few months will be speeding away to the Eastern States from Portland, Oregon, to Portland, Maine.



CASTLE ROCK, NEAR THE COLUMBIA RIVER.

Academy of Sciences.

The regular meeting of the California Academy of Sciences was held on Monday evening last. President Davidson in the chair. Donations to the museum were as follows: From G. P. Rixford, seven mortars and pestles from the ancient Timbalakees' village on the west side of Sonoma valley, where mussel shells, obsidian chips and occasional arrowheads are plowed up. From Turton A. Knox, a very large and perfect mortar and pestle, excavated one mile west of San Joaquin river, in Railroad cut. From the New Hebridee islands, a native image, said to be a religious emblem, life-size, in human form, surmounted by a skull, brought into this port by Capt. S. Simonson, of the American brig *Sea Waif*, from Malicolo. From Capt. Johnson, of steamer *Orizaba*, fishes from San Pedro, California. From Dr. A. Krause, a rare fish from the Okhotsk sea. From B. B. Redding, a mammoth barnacle, from China. From T. Harmon, coral from Monterey. From Capt. S. Simonson, snake from Fiji islands. From A. C. Tichnor, large specimens of quartz with tourmaline crystals, from Kern county; also a species of topaz.

Charles W. Friend, of Carson, Nev., presented his annual meteorological report.

A letter of thanks was received from the Bremen Geographical Society for kind attentions shown their members, the Drs. Krause, by the Academy. Another letter was read from that society, asking the Academy to acknowledge the first discovery of Wrangel Land by Capt. Dallman, in 1866, which was referred to a committee of the Academy to consider and report upon. The committee consists of Charles G. Yale, Capt. R. W. Simpson and Charles Wolcott Brooks.

W. G. W. Harford read a paper on the "Angel Fish," a variety which has attracted some little local attention of late. He exhibited the specimens in the museum and showed that the fish had long been known to science, current reports to the contrary notwithstanding.

A paper by Mrs. Dr. Mary Corran was read by Dr. Harkness on "Cœnaurus of the Hare." This is a species of tapeworm, found in the wild hare of California. Attention was first called to the swellings on the loins and thighs of hares for sale in our markets, which are called by hunters and dealers "water blisters" or "water boils." These swellings do not occur in the smaller species, called rabbits. The cause of these swellings is the larvæ of the tapeworm. Tapeworms are true parasites, and are found not only in animals, but in man, in the latter originating from "measley pork," or beef infested with larvæ.

The natural hosts of the *cœnaurus* are the dog and wolf. The coyote finds a hare with this disease an easy prey, and swallows the larvæ with the flesh. The thousands of worms are set free in the stomach and begin their growth if they succeed in fastening themselves to the walls of any part of the intestines. Each joint of the worm is complete in itself, and contains thousands of eggs. The eggs being received into the stomach of a hare, have their outside envelope removed, and the embryo being set free penetrates the walls of the intestines and at last finds its way to the loins or thighs where it develops the vesicles first described.

As far known this species of worm does not develop in man. But as a matter of precaution it should be seen to that the hare prepared for the table be thoroughly cooked. People owning dogs should be careful not to let them eat raw any of the hare with these "water boils."

The following curators of the different departments have been appointed for the year 1882 by the Council, the scientific governing body of the Academy: Mammals and birds, E. F. Lorquin; ichthyology, Charles G. Yale; geology and paleontology, E. T. Cox; ethnology and osteology, A. B. Stout; botany, J. P. Moore; entomology, H. Behr; conchology, Josiah Keep; mineralogy, C. D. Gibbes.

The publication committee for 1882, appointed by the Council to edit the publications and decide upon whether the papers read are worthy of publication, consists of Prof. George Davidson, Justin P. Moore, Charles G. Yale, Dr. H. Behr and John M. Stillman.

The Gold Hill *News* says: By running their portion of the Sutro tunnel the Overman people made a saving to the company of at least $20,000, for the charges of the Tuonel Co. are $70 per linear foot, which is in excess of the cost where the mines run the drift themselves. It was good management on the part of the Overman superintendent, and it facilitates the connection besides.

The gross output of the Hecla Consolidated Mining Co., at Glendale, M. T., for the 13 months ending Dec. 31, 1881, was $874,112.40; expenses, $636,383.73. This places the net profits at $237,728.77, which is over 15% per annum on the $1,500,000 capital stock of the company.

CHICAGO **FRASER & CHALMERS,** ILLINOIS.

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars. Improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. P. Haggin for Giant and Gld Abe Co., Black Hills also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

McCaskell's Patent Car Wheels and Axles—Best in Use.

New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street - - San Francisco, Cal.

The best of

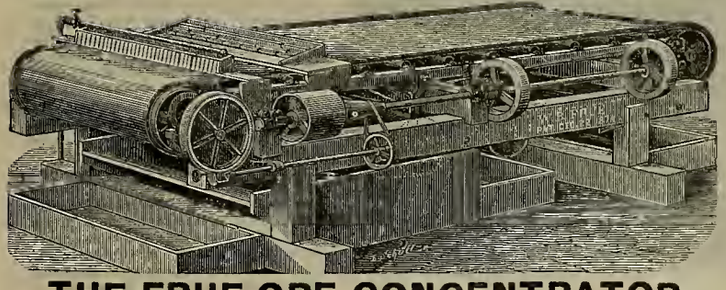
Through Dewey & Co.'s Scientific Press Patent Agency.

No. 252 Market Street. Elevator, 12 Front St., S. F. Telephone No 658.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free. DEWEY & CO., PATENT AGENTS.

A. T. DEWEY. W. B. EWER. GEO. H. STRONG

$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR.

Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.

Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.

We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of **$1,000** each, and we mean business.

☞A machine with all improvements can be seen in working order and ready to make tests, at the office of Hinckley, Spiere & Hayes, 220 Fremont street.

ADAMS & CARTER, Agents, Room 7 No. 109 California Street, S. F.

PATENT

LIFE-SAVING RESPIRATOR

Prevents Lead Poisoning and Salivation.

INVALUABLE to those engaged in Dry Crushing Quartz Mills, Quicksilver Mines, Guano Works, White Lead Corroding, Feeding Threshing Machines, and all occupations where the surrounding atmosphere is filled with dust, obnoxious smells or poisonous vapors. The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price, $3 each, or $30 per dozen. Sent post-paid to any address upon receipt of price.

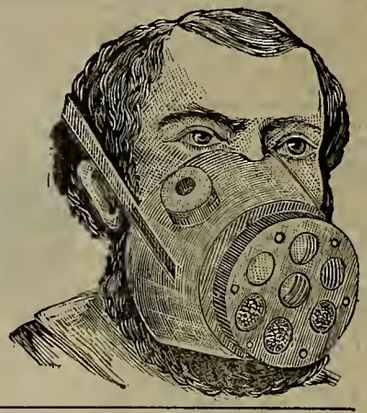
Address all communications and orders to

SETH MARSHALL, Grand Hotel,

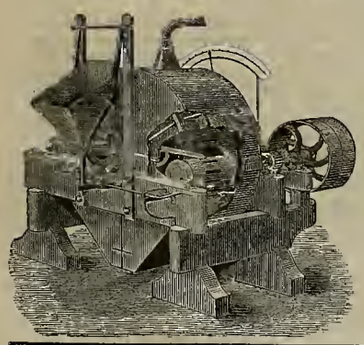
Or care of C. C. HARVEY,

309 California Street, S. F., Cal.

Send for Descriptive Circulars containing testimonials of well-known parties who are at present using them.



TUSTIN'S ROTARY PULVERIZING MILL.



WORKS ORE WET OR DRY,

And Feeds Itself Automatically.

Patented October 11, 1881.

One of these machines can be seen at the Ore Sampling and Pulverizing works of Hofmann Bros., No 415 Mission St., where it is working every day. Weight 5,000 lbs., heaviest piece 480 lbs.

Manufactured at the

TUSTIN WINDMILL, HORSE POWER AND PUMPING MACHINE WORKS.

308 Mission Street, S. F., Cal.,

By W. I. TUSTIN, Inventor and Patentee.

ENGINE LATHES IN SECTIONS.

Limit of weight for 25-inch Lathes, 300 pounds. For 17-inch Lathes, 150 pounds.

Standard and Special Machine Tools.

SAN FRANCISCO TOOL CO., No. 21 Stevenson St., San Francisco.

CLAYTON AIR COMPRESSORS,

—AND—

INGERSOLL ROCK DRILLS.

INGERSOLL ROCK DRILL.

CLAYTON AIR COMPRESSOR.

Having been appointed Sole Agent for this Compressor, I will keep a full stock of the different sizes in store. Prices much less than any First-class Compressor in the market. ☞SEND FOR CATALOGUE.☜

GEORGE R. FOARD, 18 First Street, S. F.

Sole Agent for the Ingersoll Rock Drill and Clayton Compressor Co.

VULCAN BLASTING POWDER.

—THE MOST ECONOMICAL AND BEST—

Nitro-Glycerine Explosive in the Market.

In the suit of the Giant Powder Co. against the Vulcan Powder Co. for *alleged* infringement of Patent, it was held that the Giant Powder Patent was INVALID.

Nos. 1, 2 and 3 Vulcan,

Each grade superior to like numbers of any other Nitro-Glycerine Powder in the market.

VULCAN B. B.,

Superior to Black, Judson or any low grade Powder for Bank Blasts, Railroad work, or any work where Black Powder has been heretofore employed.

TRIPLE FORCE CAPS AND ALL GRADES OF FUSE.

The CONSUMER'S COMPANY sell the best Powder at the lowest rates.

Office—218 California St., San Francisco.

Metallurgy and Ores.

WM. D JOHNSTON,

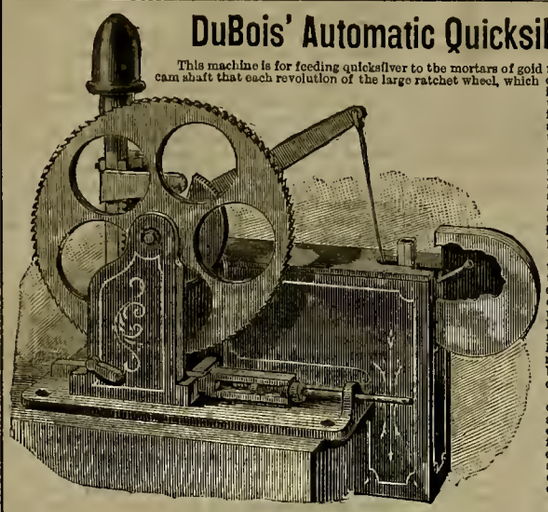
SHEET IRON PIPE.
FRANCIS SMITH & CO.,
Manufacturers of
THE PATENT CHANNEL IRON WHEELBARROWS.
THE STRONGEST BARROW MADE. These Barrows are made by Superior Workmen, and of the best material. All sizes kept constantly on hand
SHEET IRON PIPE.
Lap-Welded Pipe, all Sizes, from Three to Six Inches. Arteeian Well Pipe. Also, Galvanized Iron Boilers, from 25 to 100 Gallons.
Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools supplied for making Pipes. Estimates given when required. Are prepared for coating all size of Pipes with a composition of Coal Tar and Asphaltum.
Office and Manufactory, 130 Beale Street, San Francisco.
SHEET IRON PIPE.

DuBois' Automatic Quicksilver Feeder.


This machine is for feeding quicksilver to the mortars of gold mills. It is so connected to the cam shaft that each revolution of the large ratchet wheel, which can be regulated to revolve once in one, two, three or four minutes, as desired, dips a small cup into a reservoir of quicksilver, and by a trip of the cam, empties the contents into a pipe leading down to the mortar, supplying an exact quantity at regular intervals, superseding the ordinary hand feeding, which is of necessity subject to great irregularity, and liable to neglect. It renders the amalgamation of all the gold in the pulp equally certain and perfect.
The mechanism to produce this depression and elevation of the cup, is driven by the cam shaft, similarly to the self-feeders, over which so much ingenuity has been expended to regulate the delivery of ore to the mortar. As it is to be desired to have the ore go in constantly and regularly, so it is equally desirable to have the mercury fed constantly and regularly.
A chief point of excellence of this machine is, that it allows the quantity of mercury which would be otherwise fed in mass, in one hour, to be subdivided into a number of small portions, and fed almost continuously; *i. e.*, from every one to four minutes.
Price, complete, $100.
For Sale by **WHITNEY & MARSHALL,** Sole Agents
22 & 24 Fremont St., San Francisco.
Dealers in Iron, Steel, Hardware and Mining Supplies, Wrought Iron Pipe and Fittings, Pump Columns, Wire Rope, etc. A large stock of Boiler, Plate and Sheet Iron of every description.

MOREY & SPERRY,
MANUFACTURERS OF
Gold and Silver Grinding and Amalgamating Machinery
HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.
IT HAS BEEN FULLY PROVED AND TESTED.
It weighs complete, 7,000 pounds. It costs $1,500 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and O, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.

Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores Chloridizing Furnaces, Retorts, Rock Drills Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies Iron Work complete for Wood Frames, also
SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.
☞Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.
MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

LEFFEL'S IMPROVED WATER WHEEL.

PRICES REDUCED!
PATENTS REISSUED 1868.
The "OLD RELIABLE" with improvements, making it
THE MOST PERFECT TURBINE NOW IN USE.
Comprising the **Largest** and the **Smallest** Wheels, under both the **Highest** and **Lowest** head used in this country. Our new Illustrated Book sent free to those owning water power.
Those improving water power should not fail to write us for **New Prices**, before buying elsewhere. New Shops and New Machinery are provided for making this Wheel. Address

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, No. 252 Market St., S. F.

FOR THE WEEK ENDING JANUARY 31, 1882.

252,935.—OVERALLS—C. Adler, Alameda, Cal.
253,035.—FRUIT CAN—F. B. Ginn, Oakland, Cal.
253,036.—SEALING CANS—F. B. Ginn, Oakland, Cal.
253,166.—BALANCED VALVE—W. D. Hooker, Oakland.
252,884.—STEAM COOKING APPARATUS—J. H. Linney, San Francisco, Cal.
252,889—CABLE RAILROAD.—Wm. McCall, S. F.
252,966.—HYDRAULIC ELEVATOR—Geo. L. Pierce, Oakland, Cal.
253,121.—QUARTZ CRUSHER—Chas. P. Stanford, S. F.
253,106.—WATER CLOSET—Wm. M. Sack, Oakland, Cal.
253,107.—FILTERING FAUCET—Wm. M. Sack, Oakland.
253,131.—MOP AND SCRAPER—John E. Tiffin, Redding.
253,141.—FOACE PUMP—M. L. G. Wheeler, Oregon City, Oregon.
253,145.—DREDGING MACHINE—Z. Williams, Oakland.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

WATER CLOSET.—Wm. M. Sack, Oakland. No. 253,106. Dated Jan. 31, 1882. This improvement in water closets consists in a novel arrangement of a gate or valve which closes the bottom of the bowl, and is operated by appropriate mechanism to prevent at all times the upward escape of odors or foul air. In combination with this valve the inventor employs a chamber having within it a flexible diaphragm and pipes to admit water to each side of it alternately, so that while one side is being emptied the other will be filled. This diaphragm is connected by a rod and levers with a valve, and a cock is operated by a lever connected with the seat so that the admission of water upon one side of the diaphragm causes it to move and withdraw the rod and levers so that the valve may be opened at the proper time; but the valve is prevented from opening, while the seat is occupied, by a catch actuated at the same time with the opening of the cock. As the diaphragm moves back it forces a supply of water into the bowl. When the seat is released the cock is turned so as to reverse the flow of water and move the diaphragm back to its first position. At the same time the cock releases the valve and allows it to swing open and discharge the contents of the bowl into the soil pipe, and the return of the diaphragm closes the valve while supplying water to wash the bowl.

CABLE RAILWAY.—Wm. McCall, S. F. No. 252,889. Dated Jan. 31, 1882. This improvement in cable railways consists in a novel combination of rollers or sheaves, which are set upon a curve, so as to carry the cable around it and support it in the proper position, and at the same time allow the grip from the car to be moved around the curve in a regular line corresponding with the line of the slot, and be supported upon two or more of the sheaves at once during its passage around the curve. The grip is so constructed that it may be opened at any point in the curve so as to allow the cable to move through it while the car is stopped. The invention further relates to a means for guiding the cable while changing its grade, and for preventing its striking the upper part of the tube at such points, by means of a sheave or pulley supported upon a swinging arm, which is adapted to be moved out of the way by the passing grip, and is returned to its position after the grip has passed.

STEAM COOKING APPARATUS.—John H. Linney, S. F. No. 252,884. Dated Jan. 31, 1882. This invention relates to certain improvements in steam cooking apparatus; and it consists of a series of pans or sections placed one upon another above a steam boiler, and having one or more continuous tubes extending from the boiler to the upper chamber, and provided with valves having stems extending to the outside, so that steam may be admitted to either or all the sections, or cut off from the outside. All the sections, except the upper one, are provided with doors, which may be opened to examine the progress of the work, and the food in any section may be removed without interfering with either of the other sections. The doors are provided with guards to prevent the condensed steam from running down outside the chambers, and small openings are made into the steam tubes at the level of the floor of each section to allow condensed moisture to escape.

FILTERING FAUCET.—Wm. M. Sack, Oakland: No. 253,107. Dated Jan. 31, 1882. This invention relates to certain improvements in that class of faucets which also serve to filter the liquid passing through them, and is an improvement upon a patent issued to the same inventor May 10, 1881. It consists mainly in certain improvements in the construction, the principle being the same.

Recent Contributions to the California State Mining Bureau.

[Furnished by HENRY G. HANKS, State Mineralogist.]

[CATALOGUE.]

Scapolite—Templeton, Ottawa county, Canada.
Anthophyllite, Wilcoxite—Franklin, North Carolina.
Titanite—Arendal, Norway.
Augite and Titanite—Ottawa, Canada.
Ledererite, Gmelinite—Grattan, Ottawa county, Canada.
Phlogopite—Templeton, Ottawa county, Canada.
Phosphatic Nodule, Phosphorite, Lahn—Nassau.
Phosphorite, Land Phosphate—Ashley Key, South Carolina.
Phosphorite, Caceres—Spain.
Phosphorite, Cretaceous—Ardennes, France; with fossil ammonite.
Phosphorite, River Phosphate—Coosaw, South Carolina.
Fossil Shark Teeth, Carcharodon Megalodon (Tertiary)—Charleston, South Carolina.
Fossil Shark Teeth, Carcharodon Angustidens (Tertiary)—Charleston, South Carolina.
Fossil Horse Teeth (Tertiary)—Charleston, South Carolina.
Oliva Litorata, Pliocene Tertiary Fossil—Young's Island, 66 miles south of Charleston, South Carolina.
Natica Duplicata, Pliocene Tertiary Fossil—Young's Island, South Carolina.
Arca Incongrua, Pliocene Tertiary Fossil—Young's Island, South Carolina.
Tellina Alternata, Pliocene Tertiary Fossil, Young's Island, South Carolina.
Artemis Concutrica (?), Pliocene Tertiary Fossil, Charleston, South Carolina.
Scutella Cumquephora, Tertiary Pliocene Fossil, Young's Island, South Carolina.
Terebra Sp. (?), Pliocene Tertiary Fossil, Young's Island, South Carolina.
Lutraria Caniculata, Pliocene Fossil (Tertiary)—Young's Island, South Carolina.
Pyrula Preversa (?), Pliocene Fossil (Tertiary)—Young's Island, South Carolina.
Pyrula Carica, Tertiary Pliocene Fossil—Young's Island, South Carolina.
Two Hundred and Sixty-five Species of Fresh-Water Shells—Eastern States. Purchase.
Copper Ore—Pioneer mine, Bolenas Bay, Marin county, Cal. Assay: Gold, trace; silver, $22 per ton; copper, 10%, 11%. Frank Attwood.
Inclosing Rock, with Microscopic Section—Pioneer mine, Marin county (see No. 3358). Frank Attwood.
Anglesite-Fluor Spar and Wulfenite—Castle Dome District, Arizona. F. H Staples.
Hematite and Magnetite—Near Crescent Mills, Plumas county, Cal. A. Jacobs.
Bill or Snout of the Saw Fish, Pristis Antiquorum.
Cyprus Wood—Monterey county, Cal. J. Z. Davis.
Vase of Granite—From the quarries of Penryn, Placer county. Griffith Griffith.
Block of Basalt—Used for street pavement. Mt. Pisgah quarries, one mile south of Petaluma, Sonoma county. Luther Wagoner.
Gold from Quartz-Crescent Mills, Plumas county, Cal. Barney Tutt.
Hematite—Township 4 north, range 10 east, opposite Section 3 in unsurveyed land, 2 miles southeast of Campo Seco, Calaveras county, said to be in large quantities, and to be of easy access. A. M. Thrift.
Sulphur, Cinnabar and Gold—Large specimen: Manzanita mine, Sulphur Creek, Colusa county, Cal. C. B. Hughes.
Rich Copper Ore, Principally Cuprite—Reward mine, Genesee valley, Plumas county, Cal. S. E. Swearingen.
Grape Shot and Musket Ball—Found on Washington's first battle ground, Fort Necessity, which he defended with 500 Virginia militia against 1,500 French and Indians, under Jamonville. Having dictated the terms of his own surrender, Washington marched out with drums beating and colors flying on the 4th of July, 1754. Donated by Capt. H. A. Gorley.
Indian Relic—Hoosian Nalan Indian Rancheria, Curry county, Oregon. W. B. Mason.
Limestone Concretion Bearing a Curious Resemblance to a Fossil Turtle—Found 7 miles northeast of Santa Cruz and a little east of Big Tree grove. J. Z. Davis.
Silver Ore—Mina Faisan, Panuco Mining Co., Sinaloa, Mexico. Mark Cornish.
Phosphate of Alumina, Probably Trolleite—Columbus, Esmeralda county, Nev. C. F. Allen.
Nitrate of Soda, Crude—Niter hill, near Lovelocks station, Humboldt county, Nev. A. J. Ralston.
Refined Nitrate of Soda—Lovelocks station, Humboldt county, Nev. (see No. 3775). Crystallized for the State Mining Bureau by Ad. Sommers, manufacturing chemist.
Borax, Refined—Teel's marsh, Esmeralda county, Nev. Wm. T. Coleman & Co., agents for the works.
Borax, Refined and Pulverized—Smith Bros.' Works, Esmeralda county, Nev. Wm. T. Coleman & Co., agents.
Borax, Refined—San Bernardino county, Cal. Wm. T. Coleman & Co., agents.
Borax, Crude; Natural Product, First Quality—Smith Bros., Esmeralda county, Nev.
Borax, Crude; Natural Product, Second Quality—Smith Bros., Esmeralda county, Nev.
Ulexite, Borate of Lime—Smith Bros., Esmeralda county, Nev.
Rock Specimen, Undetermined—Five miles from Shingle Springs and 4 miles northeast of Latrobe, El Dorado county. Cal. M. T. Grogan.
Borax, Granulated—Teel's marsh, Esmeralda county, Nev. Wm. T. Coleman, agents.

THE Los Angeles *Herald* says: The probability is that Senator Jones spent, first and last, fully $1,000,000 in the attempt to show up a mine in Panamint, with the result of a most disastrous failure. In the case of the Resting Springs district several very wealthy Angelenos sunk a couple of hundred thousand dollars.

WITH only a five-stamp mill and two arastras, the mines of the Batopilas Co., Sonora, have yielded $600,000 in silver bars, and about one-quarter as much in first-class ore—this latter being native silver—in 18 months.

ADVICES from the Klamath, Lower Trinity, and New rivers, are to the effect that the mining season has opened more favorably than for years, and that from present appearances mining operations generally will be very successful this year.

News in Brief.

THERE is a disastrous flood on the Brazos river, in Texas.

RAIN and snow in the mountain and foothill regions on Sunday night.

GUITEAU, the murderer of the President, has been sentenced to be hung on June 30th.

WASHINGTON TER. is free from debt and has a surplus of over $30,000 in her treasury.

IT requires a general smallpox scare about once in so often to keep the people vaccinated.

A LOT of Chicago restaurant proprietors have been prosecuted for supplying their tables with butterine.

CHAS. B. FOSTER, the noted spiritualistic medium, is deemed incurably insane. He is in the asylum at Danvers, Mass.

THERE were about 100 applicants among navy officers to go on the search for De Long and the other missing men of the *Jeannette*.

A NUMBER of farmers living along the Salinas river are estimating the cost of pumping water with engines for irrigating purposes.

THE Carson Mint last month coined $198,000, as follows: Double eagles, $60,000; half eagles, $25,000; standard dollars, $113,000.

A CONTRACT has been awarded at Montreal for tunneling the St. Lawrence, at a cost of $3,500,000, the work to be completed within four years.

THE order of the Czar that only wood be burned in his palace is said to be owing to the fact that the Nihilists have smuggled dynamite in with the coal.

THE Sultan's interview with the American Minister, Gen. Wallace, was to gain information in respect to agriculture, and he has sent to America for specimens of the most improved agricultural implements.

MUTILATED, worn or otherwise uncurrent United States silver coins, of standard fineness, will be received at the Mint, in sums of three dollars and upwards, and paid for at the rate of one dollar an ounce.

THE *Kern County Californian* thinks that cattle and sheep-ranging has become so uncertain that the business of raising cattle and sheep will hereafter be done by farming, and the owners will grow the feed necessary for their sustenance.

WHEN Guiteau arrived at the jail he was at once taken to his cell and a guard placed over him. This precaution is always observed in the case of prisoners under sentence of death, and will be rigidly adhered to in Guiteau's case, both by night and by day.

A DELEGATION of 75 Dakota people is at Washington urging the admission of the southern half of the Territory into the Union as a State. They claim that there are 200,000 people in the area designed for Statehood, and that the voting population is 40,000.

COMMANDER CHEYNE seems sanguine of securing $40,000 on this side of the Atlantic toward the expense of reaching the North Pole by balloons. Sir Hugh Allan and other citizens of Montreal, offer to assist in obtaining a subsidy of $20,000 from the Dominion Government.

A LONDON dispatch says: The unsettled state of Europe would turn a vast amount of money into American securities, if the war of rates and other wars were suspended. Leading brokers say that they have many clients anxious to invest, but they are frightened by the serious fluctuations of the last few months.

SPEAKING of the toughness of the Pinte Indians, the Winnemucca *Silver State* says that the other night a squaw gave birth to a papoose in an open wickiup with the mercury at zero. Next day she was around, and the babe, wrapped in a rabbit-skin robe, is apparently as contented and comfortable as if born in a mansion.

ALL parties interested have decided that it is best to extend the Atlantic and Pacific road to San Francisco, to prevent the route from being taken by some other company. It is also understood that the Union Pacific shall extend its Utah system to a connection with the Atlantic and Pacific, receiving a pro rata percentage of through business.

THE orange crop of Florida, it is said, will be much shorter than was anticipated. The loss from splitting has been very heavy on the river of St. Johns, in some cases 75% and upwards. A large part of the crop has already been shipped, the fear of a freeze and the loss from splitting having induced owners to market their fruit as soon as possible.

THE Italian Consul, and, it is said, the French and other Consuls, are seriously considering the propriety of advising the abandonment of San Francisco as a port of call for the war ships of their respective nations, and of using Victoria in its place. They say that deserters are promptly arrested and returned by the authorities of Victoria, while the police of San Francisco will not look after them unless sure of what is considered an exorbitant reward.

IN pursuance of a dispatch received by Chas. Crocker from Leland Stanford and C. P. Huntington, who are now in New York, he has given out a contract for the immediate construction of the Atlantic & Pacific railroad from Mohave station, on the Southern Pacific railroad, situated at the head of Mohave desert, eastward to the Colorado river. Mohave station is exactly 100 miles from Los Angeles, and is now the depot for the Cerro Gordo mines, in Inyo county. It lies close to the 35th parallel, which the Atlantic & Pacific railroad will follow. The point at which the road shall cross the Colorado river is left open, to be designated and agreed upon by officers of both the Southern Pacific and the Atlantic & Pacific railroad companies.

PERSONS receiving a sample copy of the MINING AND SCIENTIFIC PRESS *with this notice marked*, are requested to examine the merits of the same, and consider fairly its claims for support, and if consistent, subscribe for the paper through the P. M. or agent delivering it, or otherwise. We shall send it, on trial, at the rate of $4 per annum for any period the reader may wish. Please notice our terms elsewhere, and if desired, send for further samples and information. Those who can circulate this No. further to our advantage are invited to do so.

A TURNED LEAF will point out the article supposed to be of special interest to persons receiving sample copies of this paper.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

BOOKSELLERS, STATIONERS, ETC.—Messrs. Payot, Upham & Co., No. 204 Sansome Street, are one of the oldest, most enterprising and reliable firms in the book and stationery trade in San Francisco. Scientific, industrial and foreign publications are a specialty with them. They are also noted for their fine quality of blank book and fine stationery line of goods.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $3 per (half-yearly) volume. In cloth and leather binding, $5. These volumes, complete, are scarce and valuable for future reference and library use.

CORRESPONDENCE on mining and other subjects represented by this journal is solicited from all reliable sources. Send us information, early and often, if ever so brief.

BY TELEPHONE.—Subscribers, advertisers and other patrons of this office can address orders, or make appointments with the proprietors or agents by telephone, as we are connected with the central system in San Francisco.

THE State Mining Bureau, No. 212 Sutter street, is open to the public from 10 o'clock A. M., to 5 o'clock P. M. daily, (Sundays excepted). Henry O. Hanks, State Mineralogist.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

O. W. MCGREW—Santa Clara county.
M. P. OWEN—Santa Cruz county.
B. W. CROWELL.
A. C. KNOX.
J. W. A. WRIGHT—Merced, Tulare and Kern counties.

Cylinder Printing Press for Sale.

A large cylinder Hoe printing press, for country newspaper work, can be bought cheap by addressing

Press, Box 2361, S. F.

Mining and Scientific Press.

THE MINING AND SCIENTIFIC PRESS is the leading mining journal in America, and enjoys a larger circulation among the more intelligent operators and workers in the gold fields of the world.

Established in 1860, it has firmly maintained its position as a reliable, progressive journal. The information given in its columns has saved millions of dollars to the practical miners, metallurgists, mill men, mine and shareholders on the Western side of our continent.

Among its contributors are the ablest and most experienced mining engineers, superintendents and practical miners in this country.

The PRESS gives a condensed summary of Mining News from the most important mining districts of the country.

New processes and methods of mining are described in its weekly issues. New mining machinery and improvements are frequently illustrated and explained in a manner to be of great value to all interested in mining.

As a scientific and mechanical representative of the Pacific coast it is decidedly popular, and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivalled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer, will find profit by its reading.

Subscription, $4 a year in advance. Sample copies postpaid, 10 cents.

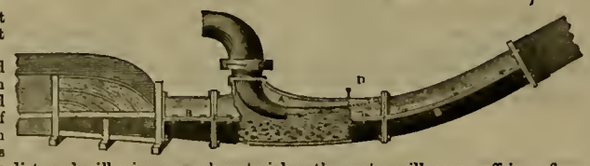
702 CHESTNUT ST PHILADA PA

HYDRAULIC GRAVEL ELEVATORS,



For working flat gravel mines that have no dump.

Sluices gravel and water up hill on an angle of 45°, and will run any kind of gravel that will run in a flume. Handles rocks as easy as fine dirt, and will raise as much material as the water will carry off in a flume on 6 inches grade to 12 feet.

No bedrock cuts, tunnels or drains required. Machine a sufficient drain itself, and the process of mining the same as any other hydraulic mine. Is now a practical success in various places in California and Oregon. Send for descriptive circular to

JOSHUA HENDY.

No. 51 Fremont Street, Office of the Hydraulic Gravel Elevating Mining Co, S. F.

Scientific, Mining and Other Valuable Books.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL.

MINING ENGINEER AND METALLURGIST.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery etc., which alone are of the greatest value. PRICE, $7.50

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 156 pages, embracing illustrations of furnaces, suplements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price, $3.00 coin, postage free.

WM. H. BELLOWS,

CONSTRUCTOR OF

Flumes and Ditches for Lumbering, Mining, Irrigation, or other purposes. Routes Surveyed, Estimates furnished, etc, etc.

HOME BENEFIT ASSOCIATION,

Of San Francisco, Cal.

INCORPORATED UNDER CALIFORNIA LAWS.

The Home Benefit Association is an organization for Mutual Life Insurance. A Benefit Fund is created by payments from each member of sums assessed in proportion to age and amount of insurance.

The amount of insurance may be $1,000, $2,000, $3,000 or $5,000 in any one class.

The age to which persons are eligible for membership is 64 years, but those over 54, at the time of joining, are limited to $3,000 insurance in any one class. Vacancies, caused by deaths, or withdrawals, in any class, which has once been full, will be filled only from applicants under the age of 50 years.

TRUSTEES—Frank Eastman, Charles H. Fish, Jesse S. Wall, William C. Randolph, John H. B. Wilkins, Harvey W. Snow, George T. Hawley, Frank C. Havens, Ambrosa Cornwall.

Tubbs Hotel,

OAKLAND, CALIFORNIA.

An elegant family residence in charming grounds. Two hundred rooms. Near steam and street cars. Forty minutes to or from San Francisco. Trains every half hour. Five-cent fare. Table d'Hote or Restaurant. Splendid suites of sunny apartments or single rooms with or without bathrooms. The most HEALTHY and agreeable location on the Pacific Coast. Mean yearly temperature 55°. Sun unobscured from March to November. A HOME for tourist or invalid. Good cuisine under a celebrated Chef. Prices more reasonable than any hotel of its character in California. Livery stable, laundry, billiard room, telegraphic communication, etc., in connection with the hotel. Special terms made. All applications answered.

VOLUME XLIV Number 7.

Foundry Notes.

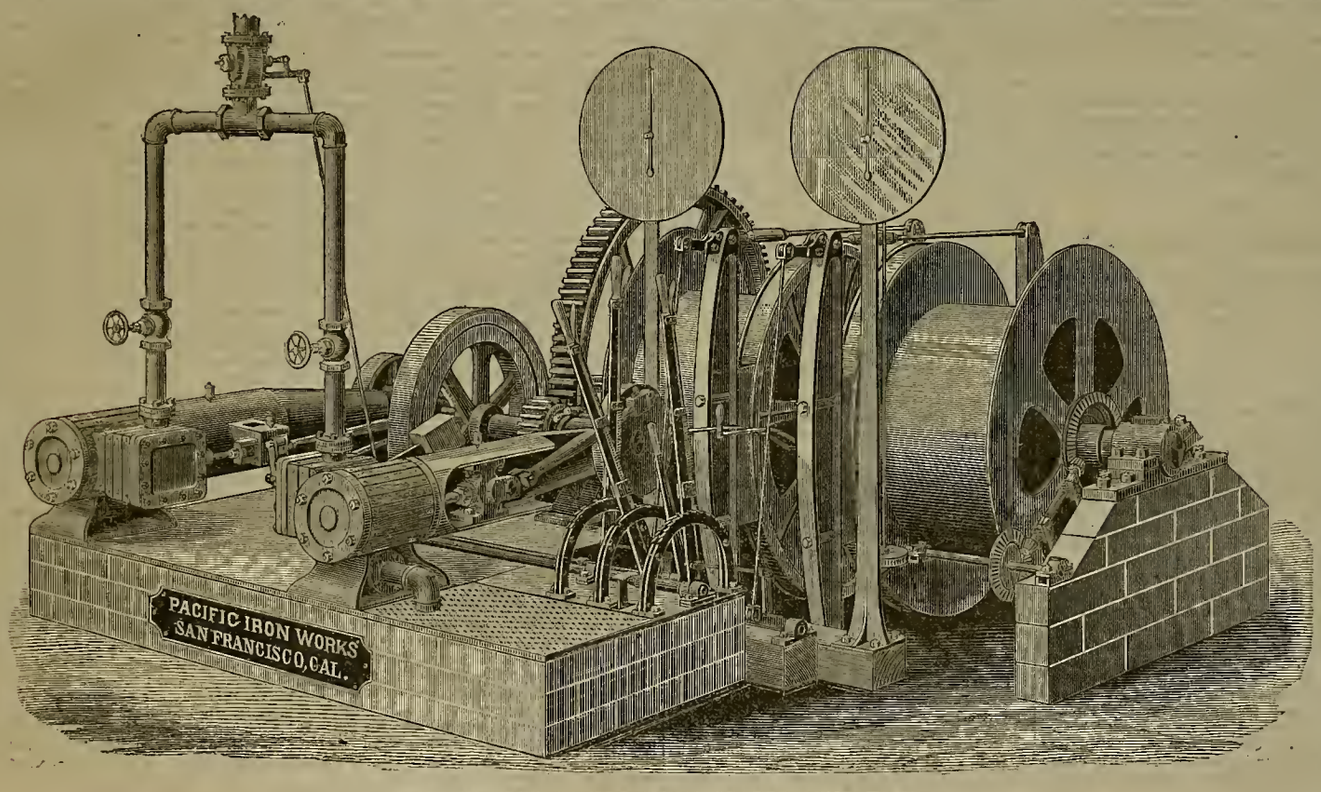
A New Mining Hoist.

Among machinery for working the mines of this coast, the hoisting engine occupies the most prominent position, because of the absolnte impossibility of reaching tho depths from which the precions metals are now mostly obtained hy any other mechanism. This machine has to deal, not only with the simple question of raising a given quantity of material from a certain level to the surface, but it has also to include in its requirements, economy, ease of working and handling, access, ability and durability of all working parts, and safety to the lives of men it transports into or out of the mines.

Among the machines of this class recently constrncted in this city, is a hoisting engine built by Messrs. Rankin, Brayton & Co., of the Pacific Iron Works, for a prominent mine in Montana, which combines within itself and in the shaft equipment all of the elements of a snccessful hoist.

It is, as the engraving shows, of the double engine, double drum geared style, with indicators attached to each drum, and each drum arranged to work indcpendently of the other, and of the engines, at the will of the engineer.

The engines are from new patterns designed expressly for the hard service of hoisting, having extra broad wearing surfaces and girder frames. The hoist is provided with post brakes to each drum and friction brake on engine shaft, the lever for operating which, together with those for operating the links and clutches and throttle valve, heing placed so as to be conveniently handled hy the engineer without changing his position. Thia hoist is calculated to raise a working load of one gross ton of ore, in addition to weight of cable, cage and car, from a depth of 1,200 ft. at a speed of 600 ft. per minute. The cages furnished with this hoist are entirely of wrought iron and steel of an improved pattern, with safety clntches and with every detail in their construotion carefnlly considered, to insure their strength, durability and safety, while at the same time redncing their weight to the lowest possible point. The enterprising firm who built this lot of machinery havo earned an enviahle reputation for the high character of their productions. This is only one of the several forms of hoists made by them, some of which wo have previously described.



NEW PATTERN DOUBLE DRUM GEARED MINE HOIST.

Barker District, Montana.—Mr. J. M. Gray writes to us as follows from Gold Run, Barker district, Montana: It may be of interest to you and yonr many readers to hear something from this comparatively new mining region in Meagher county, Montana. The Clendenin amelter has just concluded its first and a very successful run. The difficulties of starting a new smelter upon ores of a new district have heen fully met and overcome hy Supt. Foss, who fully understands his business. There are a number of very promising mines in the district upon which work is being pushed, but 70 ft. is the deepest working in the district. This is on the Barker mine; it makes a fine showing at that depth.

Copper Smelting.—Speaking of the Ludwig & Carter copper mine, the Aurora, Nevada, *Herald* says: The smelter is now turning out a little over 100 lbs. of copper every half hour, which, for its size, is considered pretty good work. A large iron water tank has arrived and will take the place of the smaller one heretofore used. Mr. Jones, the smelter, has proven his water-jacket invention a success. It does away with the use of fire-bricks and obviates the necessity of stoppages every few days to replace them. Last week a carload of copper bullion was shipped to San Francisco. Copper having advanced 23 cents, the owners of the Ludwig & Carter ought to realize a handsome fortune from their mine.

Two locomotives and 30 freight cars were demolished on the S. P. R. R. on Snnday, on the east slope of Gorgonio Pass.

Attachment for Furnaces.

Mortimer F. Wood, of this city, has just patented, through the Mining and Scientific Press Patont Agency, an improved attachment for furnaces, the object of which is to utilize the exhaust steam to produce more perfect combustion, and the muffling of the sound of the exhaust, thus doing away with smoke and noise. The invention consists of a pipe attached to the exhanst, and having within it, at the beginning, a series of flanges or blades, so set as to canse the steam to take a winding or tortnons course. The pipe is carried around the boiler on the ontside, and returned into the fire-box just above the grate bars, within the fire, and then proceeds around three sides of the fire-box, and up through the fire to the level of the live coals, across which it extends. It is here provided with apertures, from which the gas is directed upon the coals and causes more perfect combustion.

In ordinary cases exhaust steam is puffed off with considerable noise and is wasted. In this invention it enters a pipe and its rapid and forcible progress is at once checked by blades or flanges extending from the sides of said pipe alternately. There it has to pass in a winding or tortuous course, so that by the time it is conducted through the full extent of the pipes and finds an opening in the fire-box its force and power are broken, and it is ejected noiselessly and without much draft, thereby adding to the combustion and producing an economy in fuel. The blades or flanges in the pipe therefore act as mufflers, and, hy breaking the force of the steam, cause it to enter the fire-box with but slight force. A jet of steam would tend to extinguish the fuel, and, when superheated, if blown in with force would cause so great a draft as to increase combustion too much; but by breaking its force, and at the same time heating it, combustion is more perfect without heing too greatly accelerated. When the steam enters the fire-box while yet in the pipe, it is conducted in the midst of the fire for some distance, ao that when it finds its way ont it is in a condition to feed the fire. There is no moisture left in it, and its hydrogen, being directed upon the live coals, produces a more perfect combustion, and thus prevents smoke.

This device is designed as an attachment for any furnace, and the inventor claims it will effect a considerable saving of fuel. Although it is here described as utilizing exhaust steam, it is obvious that prime steam could be used, but of course with less economy.

New Departure.—The Geographical Society of the Pacific, instead of having a regnlar meeting this week, had a *conversazione*. The members of the Geographical Society of the Pacific folded up the society charts and engaged in a social *conversazione*. There was an unusually large attendance, many bringing their wives and daughters. C. Mitchell Grant, the Secretary, acted as host, and introduced several new features hitherto unknown at Geographical Society meetings; namely, lemonade, claret punch, cakes and tea. The large and comfortable rooms occupied hy the society were kept filled hy a pleased and interested gathering of people until later than the usual time for the meetings to adjourn.

The *Silver State* of Thursday says: S. Wenban has shipped from Beowawe 20 bars of bullion, valued at $24,708.69. This bullion was from Cortez district, where he has a mill and has been engaged in mining for years. Chinese labor is said to be exclusively employed in the mine.

J. W. Curtis, who came in from Oro Blanco district yesterday, says the Tucson *Citizen* of Feb. 11th, brought with him abont $3,000 in bullion, the result of a run on the Blue Wing ore in which some new developments have of late been made.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

Wood River, Idaho.

Editors Press:—The Senate mine of this place is about to be organized into a stock company, preparatory to recommencing active developments in the spring. This mine was bought originally for Messrs. Woolworth, of Ohio, and Mr. More, of San Francisco, from Messrs. King, Gerard & Co., for $1,600, and a certificate for 2,000 shares of stock as soon as the company should be organized; amount of stock to be issued not to exceed 100,000 shares.

The par value of the stock is not yet fixed, but we presume that it will not be less than $1 per share; and as they have a smelter, with 50,000 bushels of coal on hand, and on a property which, although comparatively undeveloped, is of undoubted value, the stock cannot but rapidly appreciate in value.

There are many really good mines around Galena, owned by men with small capital, which, for want of reduction works, have hitherto remained undeveloped. Most of these will, however, be worked in the spring, if the different smelters to be erected will but work the ore at a reasonable figure. Among these mines which, by proper development, might become very valuable properties, are the Tennessee, Portland and Tenderfoot, owned by Messrs. King & Gerard. The group is situated near the Red Cloud, belonging to the Senate Mining Co., and each possesses a well-defined mineral-bearing ledge; that of the Tennessee is about 2½ ft. in width and traceable on the surface its whole length of 1,500 ft. Besides these there is the Independence, Leviathan, and a dozen others equally as good, which only await capital to develop into paying mines. Of course, these ledges are not solid bodies of paying ore on the surface, but is a mixed homogenous mass containing galena ore in more or less quantities, which, as it goes down, is highly probable will merge into a solid vein of mineral.

The winter has not been near so rigorous as we were led to expect, the snow not being over 2½ ft. deep at Galena, the highest town on Wood River. Regular stage communication is kept up between Saw Tooth and the outer world, despite the many prognostications to the contrary. J. E. C.

Galena, Jan. 24, 1882.

Mineral Basin, Mariposa County.

Editors Press:—Seeing in a late number of the Press that you wish to get items from isolated camps, I feel happy to send you a little about this once prosperous and rich camp of placers. It was a common thing for men to make as much as $20 per day to the hand in ground sluicing. Wm. Lindsey tells me that he and P. Hope have picked up lumps of gold weighing over $50, in the chemisel roots; and Mr. Hope told me that he has picked up on the surface lumps weighing $40. W. Wheeler and Abercrombe have made in one day's rocking $2,000. That morning W. says to his partner, "We will do well to-day; I dreamed we got a piece like a cow's udder with the teats on it." In half an hour afterwards Wheeler picked up the identical piece, weighing $700. In a few moments his partner picked up a chispa of $300, and various other lumps that day. McHenry Van Winkle told me he saw a piece got as large as a man's doubled fist, on the lee side of my pocket ledge, with a little of my quartz stuck on it. He offered me a price for half. I did not accept. I have got at various times lumps that weighed six ounces. This a good place for a man with some capital, to invest in quartz prospecting or he could buy us all out here for a nominal sum—a few hundred would buy two veins from me, that are probably worth many thousands; its the same with my neighbors. Antone Rihn and J. P. Lawler have rich quartz here; they call it the Yosemite mine. Everyone wants to sell; we are only able to do assessments. My Ben Lomond lode has $50 rock in eight; crops out one-half mile, one foot wide. Would sell for $800, in order to get money to take out a patent for a valuable invention. M. M. Murray.

Coulterville, Mariposa Co.

Farmers as Miners in Siskiyou County.

Editors Press:—We want our mines developed, and it will take men that understand the business better than we do to do the work. We find by experience that it takes more money to open a quartz mine than we are able to furnish and keep the farm going. A number of farmers in Scott valley have located gold quartz claims near the valley, and have done assessment work on them for several years, with no other motive than to dispose of them the first opportunity that might offer itself, in order to create a market for the produce that we raise on our farms. If capitalists will investigate Siskiyou county, I think they can be suited either in gold, silver or cinnabar mines. The field is large and capital is needed. Take the west side of the valley, and the ledges carry gold, while on the east side they carry gold, silver and copper. H. C. Cory.

Ætna Mills, Siskiyou county, Cal., Feb. 4th.

Lake Mining District.

Editors Press:—I herewith send you a few lines regarding an old abandoned mining camp, Lake Mining district, Mono county, Cal., and the probability of its coming to life again, soon. You will probably remember, two years ago, when they struck a rich pocket in the Mammoth mine, which sent the stock up to $16, but soon dropped again as the pay was deposited only in bunches. I have just returned from Lake district to inspect a mine called the Lishon, situated about two miles south of the old Mammoth mine. I found a ledge cropping out, which could be traced for several hundred feet, besides three stringers from 18 inches to 12 inches, running parallel with the main ledge, which, no doubt, will come in the main ledge deeper. The mine has been worked by three tunnels, 60, 125 and 160 ft. long respectively, which all show in rich ore, the latter tapping the ledge at a depth of about 300 ft. There are also two shafts, one about 100 ft. deep. Both are in rich ore in which one can see the gold with the naked eye. The owners worked some of the ore last summer, and took out about $3,000 with an arastra. The average width of the ledge is two feet, but in some places it widens to four. There is a good wagon road built up to the mine, and the owners have spent about $8,000 on their property. The present owners are G. Troy, Eddy & Sims. C. Rand.

Bodie, Feb. 4, 1882.

Demand for Copper.

Six months ago ingot copper sold in the New York market at 13¾c per pound. Now it sells for 20½c per pound. Perhaps it may be useful to at least attempt to find some good reason for this sudden and large advance in prices, and also to take a cursory glance at the copper fields of the world, with a view to discover the sources from which a supply of this valuable metal will be drawn in the future. It will be well to also furnish as exact a statement of the present production of metallic copper throughout the globe, as our available sources of information will afford. And lastly, to mention more especially the resources of the United States, and the probability of our being able to furnish a supply for home use, as also a supply for the balance of the world, should there be a demand and a market for it.

There can be but one cause assigned for the present rapid advance in the price of metallic copper, namely, the intense activity in electrical science, and its rapid practical application to man's uses and wants. This practical use of electricity was doubtless furthered more by Dr. Franklin than by any other scientist, at least, of his day. Previous to his time it was more of a study or experiment, known to but a few scholars and students of nature's laws. And now, in our day, it is reasonable to believe that to Edison, another countryman of ours, the world is and will be more indebted for giving form, force and direction to this wonderful and powerful agent, stored in inexhaustible supply in earth's atmosphere for man's use, than to any other.

With the invention of the great dynamo-motor machines of our day, it was found possible to supersede gas with electricity for lighting purposes. Already our streets, great warehouses, mines, factories and public halls, etc., are lighted with it. Its use in private dwellings will shortly follow. It is not unlikely that at some future day our cars will be drawn, and steamships propelled, by electrical instead of steam power. Perhaps, when coal gets scarcer and dearer, it will furnish heat for our dwellings.—*New York Stockholder.*

Eureka Tunnel.—A *Sentinel* reporter visited the Eureka tunnel yesterday in company with the Secretary, Mr. J. E. Butler. The mine seems to be well worked, developments being pushed ahead by a force of 23 men. The winze is down 82 ft. and looks well. Near the bottom of the winze streaks of ore rich in black metal occur. Three specimens of this formation, each assaying upwards of $2,000 to the ton, our reporter brought in with him. Mr. Mette, the foreman of the mine, is active and intelligent in advancing the work. Recent shipments of ore to the Eureka Con. works for reduction have paid handsomely. In fact one cannot go through the tunnel and examine the drifts, winzes and upraises and the natural cavities and fissures, without being impressed with the belief that there are great chimneys of ore almost everywhere in the mountain. The prospect seems good at all points. The indications are so clear that the least experienced miner could not miss his way towards uncovering the thousand and one bonanzas in Prospect mountain that give signs of their neighborhood everywhere. This is all said without exaggeration in regard to the mine. If the title to it were clear, and if there were no apprehension of trouble on this score for the future, the stock would appreciate rapidly.—*Sentinel.*

We feel happy to state, and suppose that many will be glad to learn, that the affairs of the Lincoln Silver Mining company, of El Dorado canyon, will soon be straightened out, and the company will resume work on their mines on a sound basis. Messrs. Huntington, Baker and another gentleman, all of Minneapolis, Minnesota, have agreed to put up $30,000 for one-half of the capital stock of the corporation.—*Pioche Record.*

Cænurus of the Hare.

[Read before the California Academy of Sciences by Dr. Mary K. Curran.]

Anyone who has noticed tha wild hare (*Lepus Californicus*) which is brought in such quantities to our markets from November to March must have occasionally observed upon their loins and thighs swellings of considerable magnitude. Many are killed in which these tumors have developed to the size of an orange, though probably none so greatly disfigured are ever found in the markets.

These swellings, which are well known to hunters and market men as "water blisters" or "water boils," are found in a very considerable proportion of tha hares, but, so far as I have observed, do not occur in the smaller species which are popularly called rabbits. Although they are so frequently seen, I have never met with anyone who had the slightest suspicion of their true nature—for these innocent-looking "blisters" are tape-worms in the larva stage, waiting patiently for their final transformation.

Tape-worms are exceedingly common, most animals harboring one or more, either in the perfect or the larva state, but they are rare in reptiles. They are true parasites, living entirely at the expense of their host, and repaying him in too many instances with disease and death. Their life history is now tolerably well known; those which belong properly to the carnivora, pass their larva stage in the flesh of some herbivorous animal which is the natural prey of its future host.

Tape-worms, in their perfect form, are rather inconvenient than dangerous guests. They can be dislodged with comparative facility; but unhappily this is not true of the larvæ.

Those which may be said to belong to man, as a carnivorous animal, are *Tænia solium*, which comes to us from measly pork, and *Tænia medio-canellata*, which is derived from beef infested with vesicular larvæ, very similar in appearance to the "measle." Abyssinia is the chosen home of this tape-worm. The people of that country eat raw beef which is still warm and quivering. Small wonder then that the whole population is infested with this parasite; but as most evils have their attendant good, so have their efforts to obtain relief given to us one of our best remedies—kousso.

Tænia echinococcus, which, in the perfect form, inhabits the dog, is found in man only in the larva state, producing what was formerly called "hydatid disease," which is always dangerous, and frequently fatal. It is quite rare in this country, but in Iceland, where the dogs live huddled together in huts with their masters, and cleanliness is a forgotten art, it prevails so extensively that one in seven of the population is said to be affected with it.

Among the lower animals a notable example of the ravages caused by tæniæ is found in the disease called "gid" in sheep, produced by a larva which selects the brain as a resting place. Van Beneden, in speaking of this parasite, says: "The introduction of gid into a country is a calamity. Every animal attacked is doomed, and the only remedy is to destroy by fire the head of every one which dies of the disease." This dreaded parasite is *Tænia Cœnurus*, and in its perfect form is harbored by the dog and wolf.

The subject of this paper is also a *Cœnurus*, a name given to those *Tæniæ*, which in tha larva state, develop many heads from a single vesicle by a process of budding. It has never been described from the hare so far as I know, but Mr. C. B. Rose, of Norfolk, England, published as long ago as 1833, an account of a cœnurus found in the rabbit of the warrens, (*Lepus Cuniculus*), which may be the same. Further investigations, and especially comparison of the perfect tape-worms are necessary to settle this question.

The more detailed description which follows, has been carefully made, and as the material is abundant, can be readily verified by anyone accustomed to the use of a microscope.

On removing the skin from a hare affected with cœnurus, one or more swellings looking like bladders buried in the flesh, may be seen, ordinarily upon the loins or thighs, though they may be found in any part of the body. If the capsule of connective and muscular tissue which encloses the cœnurus be now carefully opened, a quantity of clear fluid and a bladdery vesicle escape. This vesicle is also filled with fluid, and has attached to its outer surface many smaller vesicles, and a great number, often many hundred papillæ, which, when fresh, are seen to be actively contracting. These papillæ, milk-white in color and attached by slender pedicels to the vesicle, are about two lines in length and one in breadth at the widest part, which contains the head turned inward like the partly inverted finger of a glove. The body displays a number of transverse lines, indications of the future joints of the worm.

If one of these papillæ be carefully detached and placed under a microscope, moderate pressure upon the covering-glass will cause the enclosed head to protrude and bring to view its four sucking disks and double crown of pointed hooks, 14 or 15 in each row. The hooks of the inner row are double the size of the outer; but being attached half their length nearer the center, the points of all fall in the same circle. Just beneath the dermis are seen an immense number of round or oval bodies of a concentric structure, which effervesce strongly on the addition of sulphuric acid. These are the so-called calcareous corpuscles, and are supposed to act as a kind of external skeleton.

The head and neck of this cœnurus are much smaller in proportion to the body than are those of the cœnurus of the sheep, as it is shown in the drawings to which I have had access.

The natural hosts of the cœnurus of the hare are the dog and the wolf. Our wild dog, the coyote, will serve to illustrate the journey of its life. A hare badly infested with cœnurus, becomes swollen and deformed, and as the loins and thighs are attacked by preference, his powers of locomotion are seriously impaired. In this condition he falls an easy prey to his hereditary foe.

The coyote swallows not only the hare, but its 10,000 contained larvæ, a circumstance which would undoubtedly give his victim a feeling of malicious joy, if he were in a condition to know anything at all about it. The larvæ are set free in the stomach of the coyote by the digestion of the vesicle, and a certain proportion succeed in attaching themselves, by their hooks and suckers, to the walls of the small intestine, fortunately only a very small proportion, for their way is beset with dangers, and their extraordinary fecundity is calculated in proportion to their chances of safety.

The tape-worm is a colony of hermaphrodites, each joint of which is a sexually complete animal, male and female containing thousands of eggs. It reaches maturity in about six weeks, after which period the lower joints, and numerous free eggs are discharged at each evacuation, and deposited upon the ground, weeds or grass.

The eggs are so small as to be quite invisible to the unaided eye, and being furnished with a very thick envelope, have considerable tenacity of life. The hare swallows these eggs, either by feeding upon the grass and weeds, or by drinking from pools of water into which they have been washed. In the stomach the thick envelope is digested, the contained embryo is set free and immediately starts for its predestined resting place. This microscopic embryo is furnished with six hooklets, by means of which it penetrates the walls of the intestine and imbeds itself in the muscular tissue. Here it ceases to move, its booklets fall, and it slowly develops into the polycephalous vesicle first described.

This paper has not been written to discourage the use of the hare as an article of food; on the contrary, the aim has been to point out the remedy for an evil, which is undoubtedly increasing. So far as is known this tænia does not develop in man, and if it were capable of doing so, the thorough cooking to which it is subjected would be a strong safeguard, underdone bare not being so popular a dish as roast beef rare, or ham warmed through.

From what has been said of the life history of the cœnurus, it is evident that if every affected hare were well boiled, or burned, the disease would become much less frequent. At present it is disseminated in such a manner as would almost lead one to suppose that the breeding of this parasite is an object greatly to be desired. These affected hares are sold every day in the market, and in face of the general ignorance of the nature of the tumors, no blame can be attached to the vendors. The health of the animal seems unaffected by the parasite he harbors, and in many cases they are so deeply buried as only to be discovered by incision.

These hares are either thrown away by the purchaser or are used for food after the tumors have been removed. In either case, they are eaten by dogs, which become infested in the same manner as the coyote, and like him convey infection to the hare again.

In the country this method of disposing of their bodies is still more objectionable, for they are found and eaten by various wild animals, and although the dog and wolf are the natural hosts of this cœnurus, it may have others, possibly the lynx and the fox.

In this way the vicious circle of disease is continually widening, and unless a change is made, we may expect, at no distant day, to find the hare, as an article of food, banished from our markets.

The burro, a kind of ass, becomes very much attached to the miners who use them on their prospecting tours, when they are kindly treated. A young man who had been in the habit of crossing the Rocky mountains with his beasts every spring, after wintering near Del Norte, had been very kind to the burros. He died this summer, and, after waiting four weeks for his reappearance, they escaped from their pasture and set out to search for him at winter quarters, 130 miles distant. They apparently traveled only in by-ways and by night, or they would have been captured by teamsters. Four weeks after escaping they waited one morning at the threshold of the ranch of their departed owner, 10 miles from Del Norte, where they alternately peered into the window to see if their master was there. After they had waited a long time at the door a Mexican living in the vicinity, who recognized them, penned them up in his pasture land. They broke away on the first night; their master was not there. Another neighbor put them into his enclosure, but they did not stay there either, and the second morning found them on the other side of the Rio Grande, where they had their old accustomed pasturing.

Joseph Ortiz, in Lower California, reports the discovery of rich placer mining in the region of San Elmo. It is found in the ravines, and can be washed by sluices.

MECHANICAL PROGRESS.

Use and Abuse of Files.

It is a wondsr that ths file, rather than the bummsr, has not besn recognized as tho sign of ths mannfnctnring industry. Its rangs, powsrs and nsefulness ars far beyond thoss of the hnmmer, and it can assume tho functions and psrform the work of n nnmber of auxiliary tools to which the hammer holds no nnalogy.

Whatever cnnnot be done hy tbe sst and power-drivsn machines in ths shops where the mstals are worked, is sent to the fils. The file rednces protnberances, smooths roughnesses, changes inolinations of surfaces, cuts scores, forms lsvels between parallsl drill holes, prspares snrfacss for ths scrapsr, svsns the roughnsss and inequalities of lathe work, cleans out ths suggestion of ths rih-liko projections of ths plansr, shapes the tool wbsre tbs most dclicats grinding apparatns fails, makss n hettsr finisb to the sye than nny scraping or stoning, is a saw at times, may be nsed as a chisel, takes the place of a plane, smooths ths roughnssess of oastings and forgings, reduces thsir proportions to sizs, and finishes thsm to fit. Except for drilling holes through solid mstal ths fils cnn take ths plnce of any tool used for any othsr purpose on the metals.

In England, Scotland nnd Wales, the filer is a mnn hy-himself; he has little to do with the laths man nr ths floor man. He is ths princs among ths machinists. Hers we think all ths work of the machinist may he done hy one man, and the lathe man, planer man, floor man, and viss man may he comprised in ons. But this gensral *cnsemble* is gstting out of dats here.

* * * Thsre is more nsed of attention in our sbops to ths uses and the nsefulness of ths fils. It is ths most nhused tool that evsr was employed, and it sssms to bs ths most nsglected tool. The writer ventnres ths assertion that, in hroken or whole discarded files lies a portion of the buried stock of defnnct companies which could not make hotb ends meet, and ths neglsct of the fils interest is ons of the reasons why manufactnring stock "don't pay." To he sure, a single file, howevsr fine its cut or large its cost, wonld not bankrupt a company nor movs a mark in the dividsnd list hy its loss; hut files nre in continual nse; they are callsd on for svsry emsrgency, and thsy are doing duty in ths hands of almost every employss of a mstal-working estahlishment. The snpply of files is one of ths "large" hills of every machine huilding estahlishment in ths conntry.

How to nss thess tools ought to be a fixed lins of instruction in all shops. It is an ontrsge on common mschanical taste to go through ons of ths heat of onr shops and see how this tool is misnsed, ahnsed and thrown aside half used. It is a mistake in this country to try to make a good plansr, a good laths man and a good filer out of one man. It has never succeaded—unlsss in some remarkabls instances—and it is not generally practicahle.

The nnmher of shapes of the file, demanded in the ordinary hnsinss of machine hnilding and tool making, is enough to appal ths heginner and snfficient to employ the shop life of the jonrneyman in thsir nse. At the great exhibition in Philadslphia in 1876, thsre were showhoards of file maksrs from England, Belginm, Fraocs, Gsrmany, and homs, which showsd a collection that wonld almost make a mussum. And yet nons of thess specimsns were gotten np for show merely, hnt wsre *bona-fide* specimens of tools called for and made in responss to a dsmand. Looking at thess, it would he folly to clnim a mastery of the art of filing. But with the diminished nnmhsr of shapes and sizss we uss in our general machins shops, the workman is a rsmarkahle one who can handle them jndiciously and economically.

The waste in files in our homs shops is enormous. There are some, as the hastard files, which lose their value with the sharpness of their teeth; hut all the fine-cut files have as many lives as the traditional cat. The writer knows of instances where line-finish files have "held their own" for 11 yeare constent (occasional) nse. A better fioish can he put on a surface of cast or wrought iron hy an entirely worn-out file than hy the linest emery—if the workman knowe how to use the file.—*"Cold Chisel," in Boston Journal of Commerce.*

A colorless cement for joining sheets of mica is prepared as follows: Clear gelatine is softened hy soaking it in a little cold water, and the excess of water is pressed out hy gently squeezing it in a cloth. It is then heated over a water hath until it hsgine to melt, and just enough hot-proof epirit (not in excess) stirred in to make it fluid. To each pint of this solution is gradually added, while stirring, ¼ ounce of sal-ammoniac and 1½ ounces of gnm mastic previously dissolvsd in 4 ounces of rectified spirit. It must ho warmed to liqnefy it for use snd kept in stoppered hottlee when not required. This cement, when properly prepared, resists cold water.

Masks of Mica.—A German manufacturer has succeeeded in prodncing serviceable face masks of mica, for the protection of metal and glass meltere, stone-masons and other workmen exposed to heat, dust and noxious vapors. These masks allow the eyes to he turned in any direction, and there is epace enough for epectacles, in case tbe eyesigbt is defective.

Mechanical Education.—Thsre is nothing particularly suggestive nf art in the appearancs of an ordinary crowbar, says the *American Machinist*, hnt as tbsy ars prodnced thsy represent the work of an sducated man. Such n tool—a tapsring bar of stesl—is, hesides the point, mado np of three distinct forms, beginning with a squsre, continuing witb an octagon, and concluding with a round ssction. Looking at a pils of n hundrsd or more as they come from ths hammer, it is a difficult matter to dsteot diffsrence enongh to dstsct one from nnnther. This wonld all be simple snongh if thsy wsrs forged hy tho aid of diss, hnt the fnct is that thsir correctness nf shape dspsnds sntirsly on the skill of ths individnal who presides at the hammsr. Thsre are a thousand wnys to make them unlike, nnd only one to make them alike; yet each of the three forms is msrged into the snccesding one, with a corrsctness thnt would do oredit to a draftsman, and the sizes are kspt so nearly psrfect ss to require close measoring to find whero one diffsrs from anothsr. Of conrse it is easy snongh to sss how such things may he dons if plenty of time is nllowed; hnt psrhsps the most wonderful thing about the forging of this simple tool is tbs fact that it is all done in from two nnd a half to four minntes. Any man with no guide hut his eys, who can do snch work as this, and in snoh time as this, does it hy virtue of a high education of a practical and valnable kind.

A Flexible Shaft Coupling.—Mr. Arthur Verity, of Bramley, Leeds, England, has patented an invention known as "Verity's flsxihls shaft coupling," consisting of nn arrangsment whereby strained or hent shafting, or shafts at an angle to each other, may he oonpled togethsr, and rotary motion transmittsd from ons to the other. The two snds of the shafts to hs connected are recessed or cnpped to recsivs a hall which is insarted hstween them. This hall retains ths axis of the end of each shaft an equal distance from its csnter, without rstarding or intsrfering with its motion. In ordsr to retsin the ends of the shafts in contact with the hall, and at ths ssme time to allow of any eccentric or irregular movemsnt, hossed disks or conpling plates, corresponding with each other, are fitted on thsir respective shaft-snds. These plates have projecting piecss, or lugs, which are gesred togsther in a similar manner to a toothed clntch. The outer snd of the convex conpling plate is providsd with a concave plats, this being made concentric with the hall. Ths plates are held togethsr hy holts in combination with the concave plate, at the sams time admitting of any irregular movement of the shafts cansed hy hsing strained, hent, or placsd at an angle.

Strength of Glass.—Traulionie gives the tsnsils strength of glass at from 2,500 to 9,000 lbs. per sqnare inch, according to kind; crushing strength, 6,000 to 10,000 lbs. psr square inch; transversely, hy his own trials, Millvills (N. J.) flooring glass, one inch sqnare, and ons foot hetween the end supports, hrsaks undsr a csrtain load of ahont 170 lbs., consequently it is considerably stronger than granits, except as regards crnshing, in which the two are about eqnal. It is suggssted that glass will shortly he nssd for many purposes whers other and mncb inferior matsrials are still exclnsivsly employed. Glass may he ussd as watsr conduits to hstter advantags than cast iron or tsrra cotta, as it is impervious to moisture and proof against corrosion or ohemical action. It is already considerably in nse for flooring, aod it has latsly heen successfully expsrimented with for railway sleepsrs undsr sxceptionally ssvere conditions.

Durable Molds for Casting. — Doctor Schlaegel, of Hoyerwerdaa, Germany, mannfactnres molds for casting from clay and hrown coal. Pure clay is ground very fine and kept dry for nss. The coal is also ground to a degree which is variahle according to ths kind of casting warranted. The clay and the coal are well mixed together, and when the clay is of good quality, a mixtnre of the two in eqnal proportions will do for most purposes. Cnamotte meal may he added to make the mold harder, hut is not ahsolutely necessary. The mixture is worked, aftsr the addition of water, into a stiff mass, which is used for the molde, the latter heing made in a manner similar to sand molds, and dried slowly. When dry they are washed with a dilute solution of solnhle glass and dried again, tbie operation heing repeated, three or fonr times. When perfectly dry, the mold is hurned to give it a glossy appearance.

The piston speed of engines has, until recently, heen practically the same ever eince the engine came into general use. The tendency of late years, however, has heen to increase speed. Formerly the average speed of piston was ahout 300 ft.; it is now prohahly not less than 450 ft. Of course the speeds are generally suited to the work. Some run up to 700 ft. and even more per minute.

Carbonic acid, so necessary for the production of vegetation, yet only forme a thousandth part of the atmosphere. It is calcnlated, however, that when taken to the full altitude of the atmosphere the lattsr contains the enormous total of 3,400,000,000,000 tons of carhonic acid. This amounts to ahout 28 tons over every acre of the earth'e snrface.

A Steel Bar held in the direction of a magnetic needle, and strnck several hlowe witb a hammer, will become magnetized.

SCIENTIFIC PROGRESS.

Pre-historic Tides.

Prof. Ball, of England, in n recsnt lscture, spoks as follows:

At pressnt the moon is 240,000 miles away, hnt there was n time when ths moon was only one-sixth pnrt of this, or say 40,000 miles away. That time must have corresponded to some geological epoch. It may hnvs heen earlisr than the tims whsn Eozoon livsd. It is more liksly to hnve hesn later. I wnnt to point ont that when the moon was only 40,000 milss away, we had in it a geological engine of transcsndent powsr. If ths pressnt tidss bo threo ft., and if ths early tidss he 216 times their pressnt amount, thsn it is plain that the nncisnt tides must have besn 648 ft.

There can be no doubt that in ancient times tidss of this amount, and sven tidss vsry mucb largsr, mnst have occnrred. I ask the geologists to taks ncconnt of thsse facts, and to considsr ths sffect—a tidal rise and fall of 648 ft. twice evsry day. Dwsll for ons moment on the suhlims spsctacls of a tide 648 ft. high, and see what an agent it would he for the performance of gsological work! We are now standing, I supposs, soms 500 ft. above the levsl of the sea. The sea is a good msny miles from Birmingham, yst if ths rise and fall at ths coasts were 648 ft., Birmingham might he as grsat a ssaport as Liverpool. Thres-quarters tide would bring the ssa into the streets of Birmingbam. At high tide there wonld he ahont 150 ft. of hlue water ovsr our heads. Evsry honss would hs covered, and ths tops of a fsw chimnsys wonld alone indicats the site of the town.

In a few honrs more the wbols of this vnst flood would have retrsated. Not only wonld it lsave England high and dry, hut prohahly tbe Straits of Dovsr would bs drained, and perhaps sven Ireland would in a litsral sense become a membsr of ths United Kingdom. A few hours pass, and the whole of England is again innndated, hut only again to hs ahandoned.

Thsss mighty tides ars the gift which astronomsrs havs now made to ths working machinery of ths gsologist. They constitnts an sngine of terrific powsr to aid in ths great work of gsology. What would ths puny sfforts of water in othsr ways accomplish when compared with these majsstic tidss and tbe great cnrrents thsy produos?

In the grest primeval tidss will probably bs found the sxplsnation of what has long hssn a rsproach to gsology. The early palæozoic rocks form n stupendous mass of ocssn-mads beds, which, according to Prof. Williamson, ars 20 milss thick np to the top of the silnrian heds. It has long heen a difficulty to conceive how snch a gigantic quantity of material conld have heen ground np and depositsd at the hottom of ths ssa. The geologists ssid: "The rivers and othsr agents of the present day will do it if you givs them time enough." But, nnfortunatsly, the mathematicians and the natural philosophers would not givs them time snough, and thsy ordered ths geologists to "hurry np thsir phsnomsna." The mathsmaticians had othsr rsasons for helieving that the earth could not have heen so old as the geologists demanded. Now, however, the mathematicians havs discovered the new and stupendous tidal grinding engins. With this powsrfnl aid the geologists can get through their work in a rsasonahle psrfod of time, and the geologists and the mathematicians may he reconciled.

How Comets Affect the Earth.

Prof. Lewis Boss, in his recent prizs essay on comets, says: "The influence of comets upon ths earth, is in all prohability quite insignificant. They may, liks the sun, affect the sarth's magnetic condition, and thus to some extent, possihly, its meteorology. No such effect has ever heen perosived. In epite of eome chance coincidences hetwesn the apparitions of great comets and remarkable public events, no well-informed psrson now believes that there is any real connection hetween them. By a liheral and credulous interpretation of any frequently occnrring celestial phenomenon, similar coincidences could he shown. When a comet is converted into meteoric hodies, which impinge npon the earth'e atmosphere, there ie some direct though prohahly minnte effect. Some have thonght that a sensihle portion of the heat which the earth receives is generated in thie way; hut the weight of scientific opinion seeme to he against that hypothesis. The impact of meteors npon our atmosphere mnst add some matter to it, and this is prohahly in the form of dust. This may he the origin of the so-called cosmic dust, which has been collected at sea in recent times. The finer particles of it may have some influence on cloud formations and other msteorological phenomena; but all this is merely conjecture. A more remote effect may he sought in the possihle fall of meteors and comets npon the surface of the sun.

Owing to his vast hulk, the sun would attract an immense nnmher of these bodies; hnt it is qnite certain that their effsct npon the sun'e heat is insignificant. It is now generally admitted that we muet look for the origin of the eun'e heat in a constant, though to ns imperceptihle, ehrinkage of hie vast hulk. Some connection between the freqnency of eun-spots and comets bas been rather vaguely snspected. Were ths search for comsts systematically pnrsued witb eqnal pssistence for a long period, ws might have soms data for ths formation of n sonnd opinion. Yst it would still be an open qnsstion, whether ths comsts canse ths spots, or whsthsr grsater activity of ths snn tends in soms way to render comsts hrighter, so that more will bs visihls—with prohability in favor of the latter supposition. Finslly, it msy hs said, with all due rsspect to scientifio dscorum, that ths appearance of a grsat comst doss exert one most happy influsnce on ths sarth, in that it stimulates ths curiosity of mankind, and directs their thoughts to ths more partionlar contsmplation of ths glorious univsrss which snrrounds them.

Phosphorescent Coral.

C. F. Holder, in ths *Scientific American*, says: "Ths appsarances of phosphorescsnt light among corals is of sxtrsmsly rare occurrence, and during a long residsnce in the coral conntry, and of continusd obssrvation, the phenomenon was only obssrved onco, and that in ths gsnus *Caryophillia*. The spscimsn was first ssen from ths hoat in about 30 ft. of water, and brought np hy diving, immediately placed in a jar of water, and finslly transferrsd to an squarium that had heen huilt so that the tids rose and fell in it. Hers the beantiful specimsn was lodgsd, so that evsry movement of the animal could he obsarved. It had five hranches, each one forming a cell showing heautiful radiating plates, striated extsrnally, and collected into a solid conicsl polyparium fixed at ths hase. In this specimen the green was only faintly obssrvsd; and when the animal was within its cell the color of the mass was more inclined to yellowish hrown.

The situation of the coral was ahout n foot nndsr the surfacs, and a platform had been arrangsd so that ths obssrver conld watoh it from the watsr's edgs, and while so doing ths light was first seen. At first we thought it might have heen the phosphorsscent flash of soms minnts acsleph, myriads of which wsre floating ahont, hut to remove all douht a glass funnsl, slightly tintsd, was gently lowsred down ovsr it, and a second later a slight flssh illuminated it, and thsn another, showing a faint light that made small objects visihle in the immediats vicinity of the polyp; and at one time a pteropod was snddenly thrown into a hrilliant light whsn within a fsw inches of it. Ths flashss sesmed to hs intermittsnt, and to pervade the entirs facs of ths csll in much the same fashion as does ths light of the firefly ths surfsoe of that inseot. By lowering a hlack glass near it an idsa was ohtained of ths sizs of ths reflsction which was on ths glass, an oval illuminatsd spot sesmingly ahout the size of a silver qunrtsr, and the color of the spark ysllow, with perhaps n hlnish tint.

The Asteroids.—The nnmber of asteroids that have heen discovsred is now 220. Recent researches hy Hsrr Hornstein, commnnicated to the Visnna Acadsmy, appear to prove that the nnmhsr of those with a diamster of ovsr 25 geographical miles is extrsmely small, and that prohably all sucb wers discovered hefors 1859. On the other hand, ths numherof asteroids with a diamster less than fivs miles, seems also to hs very small, at least in the parts of ths astsroid zons next to Mars; in the outer regions nsxt Jupitsr thers may hs a more considsrahle number of these very small bodies. Most asteroids sesm to have a diamster of hetwssn five and 15 milss. Ths avsrags nnmber of asteroids with a diamstsr of hvs to tsn miles discovsred annually within the last 20 years is ahout thres; the numhsr of those of ten to 15 miles diamster ahout 1.6. Thus, should no telescopes grsatly more powerful than ths pressnt onss hs ussd in the futnre in ssarch for thsse hodiss, we may sxpect hut a moderats "find" of astsroids with diamstsrs under five or ovsr 15 gsographical milss, while a considerahls increase of those witb diameters of five to 15 milee may hs looked for. It further appears that in the case of smaller asteroide of five to ten milss in diameter the improvement of optical instrnments and star maps has resnlted in no great increase of annual discoveries in the inner zone; such an increase is observed only in the outer zone. Within certain zone limits there is an increase of the average nnmher of yearly discoveries with the time and with the distanoe from the sun; hut heyond the outer limit thie increase ceasss.—*London Times.*

A New Motor Gas.—It is stated that a French chemist has devised a way of producing gas from carhonate of lime to hs used as a motor, which it is said will furnish the cheapest motive power known. Chalk or lime is one of the most ahnndant materials of which the crust of the earth is composed, and a cheap motive power furniehed hy its disintegration would revolutionize transportation. Several tramways are heing run in France hy this motor. The gas can he extracted from the stone and stored, and after heing used condensed again.

Photography of Gas Flames.—Gas-fitters have recently made a most useful application of photography. They photograph gas flames given hy different hurners or jets, so that a customer can see if the shape and form of a light will suit him hsfore he gives his order. As the flames are, moreover, depictsd "life-size," the purohaser can always tell whether his jet is np to tbe standard.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Horn Silver, Feb. 7th, $15,000; Barbee & Walker, 7th, $3,185; Stormont, 7th, $7,795; Germania, $5,100; Hanauer, 7th, $2,150; Horn Silver, 8th, $22,500; Tintic, 8th, $3,321; Horn Silver, 9th, $12,500; Germania, 9th, $2,600; Hanauer, 9th, $2,160; Northern Belle, for Jan., $66,470; Standard, for Jan., $145,954 in gold and $14,197 in silver; Syndicate, Feb. 6th, $6,596; Star, 6th, $1,618; Eureka Con., 4th, $4,893; Standard, Jan. 31st, $14,839; Northern Belle, Feb. 6th, $8,393; Bodie, 12th, $8,860; Northern Belle, 9th, $7,979; Star, 8th, $1,457; Tiptop, 11th, $10,000; Ophir, 4th, $12,484; Eureka Con., 6th, $1,779; Mt. Diablo, 10th, $8,516; Inyo Con., 13th, $20,000; Caledonian, for Jan., $12,000, Father de Smet, Jan. 8th, $22,500; Homestake, Jan., $22,000; Star, Feb. 10th, $1,278; Contention, 15th, $18,858.

THE profits of the Richmond M. Co., Nevada, during the past six months, after paying all expenses, have been over a quarter of a million of dollars.

MINING SHAREHOLDERS' DIRECTORY.

Compiled every Thursday from Advertisements in Mining and Scientific Press and other S. F. Journals

Mining Share Market.

Stocks are very weak and quiet, as will be seen by referring to our table of sales. The flow of water from the Exchequer into the Jacket is still very strong. The water is several ft. above the 2828 level of the Yellow Jacket mine, causing the stoppage of all underground work. It also stops work in the Imperial and adjoining mines. While some say the flow of water is from a natural reservoir, others assert that a drift was accidentally run into some old workings that have been filled with water for several years. The *Enterprise* thinks there is likely to be found a good body of ore in the "hig hend" of the lead. This curve occurs in Mexican ground. The south drift from the bottom of the joint Mexican and Union Consolidated ground is now cutting seams and stringers of ore, and good ore—not merely favorable assays. This would appear to show that a body of ore of value is at hand.

Crosscut No. 1, on the 2700 level of the Union Consolidated, is looking very well. The diamond drill has been put into the face. While the drill shows a considerable amount of water, it does not show a quantity sufficient to interfere with the operations of the workmen. The ground through which the drill has been passing is very soft, on which account, and on account of the water, it is impossible to obtain reliable assays. All that can be said of this section of the mine therefore, is that the assays are very favorable without being perfectly trustworthy.

Work has again been resumed in the drift south from the bottom of the joint Ophir and California winze on the 2700 level.

The Horn Silver (Utah) dividend of $300,000 was paid at New York last Tuesday. This is the largest dividend that any silver mine in the United States is now paying.

The Ontario Mining Co., (Utah) have declared a dividend of 50 cents per share, or $75,000, payable immediately. This is the 71st consecutive dividend, and aggregates $4,100,000.

THERE are in Nevada county 350 square miles, more or less, of auriferous gravel channels that can be mined by the hydraulic process only.

THE PURCHASE OF MUTILATED COINS.—The following circular has been issued by Director Burchard, of the Mint Bureau, regarding the purchase of mutilated silver coins at the Mints of the United States: The Superintendents of the United States Mints at Philadelphia, San Francisco, Carson and New Orleans, have been authorized to purchase mutilated and uncurrent United States silver coin of standard fineness, at the rate of $1 per ounce, troy weight, when presented in sums of $3 and upwards. Coins can be forwarded to those Mints by registered mail, or by express (charges prepaid), and the value will be returned, at the seller's risk and expense, by express, registered mail, check or draft. Persons sending full-weight United States subsidiary silver coins would receive, at the rate authorized, eighty cents per $1 of their face value, but for mutilated coins, a less amount, proportioned to their deficiency in legal weight. At the rates paid, mutilated silver coins will be worth at the Mints: Per ounce, troy, $1; per ounce, avoirdupois (about), 91; per $1, face value (approximately), 70 to 76.

WORKING TAILINGS.—The Pioche *Record* thus describes the method of working over the tailings of the rich ores that went through the mills in the palmy days of Pioche: "The thirteen tables now in operation at Bullionville run through about 50 tons of tailings every 24 hours. It takes about four tons of tailings to make one of concentrations. The concentrations average about 50% lead and 60 ounces of silver. After coming from the tables they are hoisted by a powerful China pump into two large tanks, from which place they are put into a mill—invented by St. Pierre, of Bullionville, for that purpose—and thoroughly mixed with a certain proportion of lime, after which they are spread on the yard, and when dry are ready to be put through the furnace."

FIVE copper mines in Arizona produced 8,100,000 lbs. copper last year, including nearly 5,000,000 lbs. by the Copper queen Co. This company expects soon to produce 1,250,000 lbs. per month.

MINING SUMMARY.

This following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

GRAVEL.—Amador *Dispatch*, Feb. 14: Jas. Coyner is making preparations to open a gravel claim north of town. He intends to work it with a hydraulic. It is a very favorable location. Knight & Co.'s machine shop has been running night and day this week in order to have a 10-stamp mill completed on contract time. It is for El Dorado county.

BUTTE.

MORE GOLD.—Butte *Record*, Feb. 12: A prominent miner of Butte creek brought $1,500 in gold dust to town yesterday and deposited it in the Bank of Butte County, and it was sent to San Francisco this morning. The gold is of a very pure quality, and is the result of only a few days' clean-up. Fifteen hundred dollars is about the average amount taken from the Butte creek mines every 2 weeks. The gold brought dowo is always well guarded, 3 men generally coming along with Winchester rifles, and highwaymen attempting to stop these men would find tough customers to deal with, as they are plucky men and would fight as long as they could handle a shooting-iron. It is expected that much larger amounts will be taken from these claims as soon as the light spring rains set in.

CALAVERAS.

LAMPHEAR MINE.—Calaveras *Chronicle*, Feb. 11: Work on the Lamphear mine is progressing favorably. The mine is entirely free from water, and the hoisting works are up and work splendidly. Ore is now being taken out and there is a considerable quantity already on the dumps. The ore prospects well. The mill—a 12-stamp battery—is fast approaching completion, and is expected to be in operation in a few days. In fact all the fixtures of the mine are first class, and there is not the least doubt but that the Lamphear mine will prove itself a valuable piece of property.

EL DORADO.

DITCHES OPEN.—Georgetown *Gazette*, Feb. 10: The ditches of the Cal. W. & M. are now open, and everybody is happy, and none more so than Mr. Findley. The golden dust will soon begin coming in again and our merchants will look better natured. Some of them were beginning to look terribly down in the mouth. Their books were filling up faster than their pockets Managing Director Findley of the Cal. W. & M. Co., has returned from a week's visit to the Bay, radiant with health and buoyant over the outlook of prosperous times for the year just opening. He finds the ditches, which have been clogged with ice and snow, running more freely; that the Eureka clean-up was very favorable; that a number of prospect quartz mines are showing up well; that several new orders for water have been spoken for, and gratifying to note, he finds the citizens of Georgetown possessed with a spirit of increased assurance over the prospects of increased trade.

MT. GREGORY.—We notice that A. J. Wilton is down from Kentucky flat. He is quite enthusiastic over the mining outlook in the vicinity of Mt. Gregory, and well he may be, for we hear of nothing but flattering reports of the mines there.

INYO.

CERRO GORDO.—Inyo *Independent*, Feb. 11: Supt. M. A. Wheeler, of ths Swansea M. Co., paid Independence a business visit during the week. He is working the Nemesis and Original mines, properties formerly owned by Joe Diaz, situated in lower Cerro Gordo. As soon as they, in connection with the Palma, are sufficiently well opened to insure 20 tons of ore per day—the early accomplishment of which work there can be no doubt—it is probable that ths Hawley mill on the lake will be leased and run by the Swansea Co. As we predicted when the company bought the Palma, or Gold Hill mine, Mr. Wheeler will not allow the mines to lie idle.

MARIPOSA.

BEAR VALLEY.—Cor. Mariposa *Herald*, Feb 14: D. Walton Birmingham, the efficient and gentlemanly superintendent of the Mariposa Land and Mining Co., has been called to New York on important business connected with the estate. He left here last Sunday, Feb. 5th, with the expectation of returning to Bear valley in one month or six weeks; and upon his return we all may rely upon a vigorous prosecution of the works upon the estate at the following points: River Tunnel, Josephine, Princeton and Mariposa mines. The first operations will be, in all probability, at the north end of ths estate, in the River Tunnel—where the last work developed a large vein of quartz—known as the Succudo mine. The vein is some 30 ft in thickness and sunk upon 500 ft from the level of the main tunnel, and drifts run southeasterly 700 ft, all showing the same width of vein. This immense size of vein at this depth and the length that has already been run upon it, must eventually lead to a big bonanza.

COMPROMISE MINE.—The new mill on this mine was started up during the first week in January last, but owing to the severe frosts the necessary supply of water was cut off, and as a consequence the mill was stopped until the 3d inst., when it again started up. What made the stoppage more annoying to the owners of the mine was the fact of having plenty of rich ore on the dump, to which they were constantly adding from the mine. Precautionary measures will be taken to guard against a recurrence of the cause of delay next winter. The mill run 4 days and a half and cleaned up 850 lbs. of amalgam, being at the rate of nearly a lb. per hour for the time of crushing ore. The quantity crushed was all taken from the shaft in sinking. The rock is getting richer as the sinking progresses. The new shaft is now down 100 ft below the old level. The old level is in 300 ft on one side and 150 on the other, and at a depth of 70 ft from the mouth of the shaft. The miners are now making stations in the new shaft 100 ft below the old level, for the purpose of running another level. This will give 100 ft of stope on both sides for 450 ft. The wealth of the mine is, from present appearances, wonderful. The deeper the miners delve, the richer is the rock. The rock, according to careful estimates by credible and uninterested miners, will yield between $50 and $60 per ton. Such a scarcity of water caused the mill men to start up 8 times in order to run 4½ days.

MONO.

BODIE.—*Free Press*, Feb. 14: During February, March and April some interesting ground in Bodie will be prospected by crosscuts. The Standard Con will take a look at the 1200-ft level during that time and during the coming summer. At present ths crosscut on the 1000-ft level is in a good looking formation and a body of ore is liable to be encountered on that level almost any day. Crosscuts from the Lent shaft will also cut through an interesting country. Faith continues in the permanency of the Standard and Bodie mines, and it is to be hoped that those who are spending the money for prospecting will realize handsomely before another year rolls around. The Oro shaft is now down 750 ft and a sump is being cut out. Crosscutting will soon commence to prospect the veins encountered in the upper levels. The stock is now quoted at low figures and we look for an advance in the distant day. The Tioga is looking better than it has for some time, while the Noondays are extracting the usual amount of ore. To-day the Bodie Tunnel mill will start up on ore, the break in the machinery having been repaired. It is reported that several of the hoisting works now idle will soon resume operations; that the Belvidere, Dudley, and one or two other mines controlled by H. M. Yerrington, will be worked. Such a change for the better would be of the utmost value to this camp and the district generally. It is well known that the Dudley has a body of ore, but owing to the water and the present light machinery nothing can be done on the lower levels.

PLACER.

CEMENT MILL.—Placer *Times*, Feb. 11: The new 10-stamp cement mill in the Hayward claim, at You Bet, John Spaulding superintendent, is being run to its fullest capacity crushing about 70 tons of cement each day. This mill has just been put up in the mine this winter and has only been running a short time. The first clean-up has not yet been made and the result of extracting the gold from the hard cement by means of crushing is not definitely known. The prospects favor a good clean-up.

PLUMAS.

SAVERCOOL MINE.—Butte *Record*, Feb. 10: Mr. Wm. Savercool, one of the late owners of the famous Savercool quartz mine, of Plumas county, returned from New York this week and is registered at the Chico hotel. He will leave for Greenville to-morrow, going by wagon until he reaches the snow, when he will take snow-shoes and make the remainder of the trip. He has considerable baggage which he says will be taken over the mountains by Indians on sleds. The Savercool mine is one of the largest and richest in the State. Its former owners put in the best quartz crushing machinery last spring that could be purchased, and the result is that the Savercools, who began poor, have, within a few months, become immensely wealthy. The mill has been idle for some three months, but a large number of men have been kept at work in the claim. Mr. Savercool informed a *Record* reporter this afternoon that his trip East was for the purpose of selling the mine. He succeeded in disposing of the mine to the New York M. Co. He said that mining operations would begin in the spring with a "boom." The New York Co. will put in over $50,000 worth of machinery.

SHASTA.

FUO ITEMS.—Shasta *Courier*, Feb. 11: Our burgh continues to flourish notwithstanding the recent shutting down of the Centennial Con. It is understood that this suspension is to be but temporary, a preparation for a new deal. The Chicago mine continues to yield the superior quality of ore mentioned a few weeks ago. The carload which the owners propose to ship below is almost completed and a portion thereof is already at the depot. The Hardscrabble continues in operation with two giants, although the scarcity of water is beginning to be felt. A large scope of the surface, as deep as the flume will carry it, has been cleared, leaving a sufficient space for one or two season's work with an elevator. The Deer mine, below Horsetown only awaits water to begin operations, for which the past several months have been spent in preparation. Mr. Deer has put in a 50-ft elevator which has the power to "lift things." Smaller enterprises are yielding highly satisfactory returns, and altogether our people are prosperous and happy.

SIERRA.

SIERRA COUNTY AT THE FRONT.—*Tribune*, Feb. 8: A quartz specimen taken from the Rainbow mine last summer and shipped to London, where it has been on exhibition, was worked at that place recently, the net value being $23,000. It was probably one of the finest single quartz specimens ever found in the State.

HARLEM MINE.—The superintendent's report from the Harlem mine at Alleghany to the company in New York, is that "No. 3 tunnel is being pushed rapidly ahead and prospecting well."

SCALES' DIGGINGS.—Charles Hendel & Co. have suspended operations in their bedrock tunnel, until a new survey be made. The Union Hill Co. have been running full blast at their claim. Since last writing we have had about 3 ft of snow, and some quite severe winds. Last night the thermometer stood 10° above zero.

ALASKA MINE.—The Alaska Co.'s 20-stamp mill is running regularly. Some very fine looking ore is being taken from the mine, showing free gold in abundance. Thirty miners are employed at present. We understand the company will commence sinking their main shaft at an early date.

THE GOLDEN STAR.—Will. Hanley is working quite a force of men at the Golden Star drift mine, Alleghany. The company has expended $100,000 since commencing operations on this claim. But, from the fact that the section in which the Golden Star is located seldom fails to yield satisfactory returns to those who develop its resources with honesty, economy and judgment, there is no doubt but that the company referred to will soon have been recompensed for the vast amount expended by it.

DIVIDEND DECLARED.—The Bald Mt. Drift Mining Co. of Forest City declared a dividend of $5 per share this week.

MORE LIENS.—*Mountain Messenger*, Feb. 11: A gentleman by the name of Booth, of San Francisco, has filed a lien against the Marguerita quartz mine and mill for $2,000, machinery furnished. Some of the workmen at this mine were paid only 25 cents on the dollar.

SUFFOLK.—The Suffolk Co. at Wahon is still busy blasting for a dump, but will soon have it completed.

NEVADA.

WASHOE DISTRICT.

SIERRA NEVADA.—*Enterprise*, Feb 12: On the 2700 level the main north lateral drift has been extended 15 ft and the joint Union Consolidated east winze has been sunk 9 ft.

ALTA.—We have been engaged the greater part of the week in clearing out and enlarging the sub-drain in the east drift, which is now in good shape. Rock hoisted, 411 cars; wood consumed, 76 cords; strokes made by pump, 71,200.

YELLOW JACKET.—On the 2328 level work in the east crosscut was suspended and the men put to work cleaning out the south lateral drift on the same level. This drift connects with the Crown Point and Belcher workings and has been badly caved and filled with debris since the mine was flooded. Work on the 3000 level has been delayed during the past week by the flooding of the same, caused by a large flow from the Crown Point 2700 level.

UTAH.—On the 2500 level the east drift has been advanced 36 ft. The pumps are running all right

OPHIR.—During the week 24 tons of ore were extracted from the croppings.

CON. VIRGINIA.—Are still cleaning out and repairing drifts and winzes on the 1650 and 1750 levels connecting with the old Con. Virginia shaft.

MEXICAN.—On the 2700 level the main north lateral drift has been extended 21 ft and the main south lateral drift 11 ft. This drift is showing ore giving fair assays.

CALIFORNIA.—On the 1050 and 1750 levels are still cleaning out and repairing the drifts and winzes connecting with the old Con. Virginia shaft.

UNION CON.—The east drill hole has been extended 210 ft. The joint Sierra Nevada east winze has been sunk and timbered 9 ft.

BATTLE MOUNTAIN DISTRICT.

ANTIMONY.—Lewis *Herald*, Feb. 8: Lumber has been sent to the McCullough antimony mine and a force of men will be set to work as soon as the weather permits. This mine is situated in Cottonwood canyon, in old Battle Mountain mining district, and was formerly owned by A. M. Starr, of San Francisco. We understand that a New York company have taken the mine in hand and will develop it. J. L. McCulloch will have charge of the work, and under his able management we are satisfied the mine will be thoroughly prospected and its merits exposed.

CAMPBELL DISTRICT.

ORE.—Lewis *Herald*, Feb. 8: The Hoskins Bros., from Campbell district, arrived Saturday night. They are taking out some very rich ore, the streak being about five inches wide. Several tons of ore are on the dump ready for shipment. The ore carries a large per cent. of lead and has to be smelted.

CANDELARIA DISTRICT.

NORTHERN BELLE.—*True Fissure*, Feb. 11: Thirteen ft have been added to the depth of the main shaft during the week. The total distance made since sinking commenced has been 50 ft. The fourth shaft level continues to look well, and the ore upon which sinking is being done in the drift run from the 25-ft winze shows an average grade of $70 per ton. A very important development has been made during the week in the west part of the mine. It is on the 10th level, where some very fine ore has been opened into which so far as proved shows an average width of 4 ft and looks very promising. At this point facilities for extraction are quite limited, but a crosscut is being run which will reach the ore in about a week and enable its extraction quite easily. The daily yield of ore has been about 01 tons. Mill No. 1 started up on the 1st inst. and is running half time on Mount Diablo ore Mill No. 2 is doing its usual work on Northern Belle ore. Shipments on February account to February 9th, $16,353.43.

MOUNT DIABLO.—The general appearance of the mine is much the same as at the time of the last report. The west drift on the second level is giving some $150 ore from a small streak that appears well. The stope on the first level continues to look well and is yielding very good ore.

PRINCESS.—The retimbering of the shaft still continues and is progressing favorably. One or two days were lost during the week owing to a scarcity of timber, the antichated supply not arriving on time.

ESMERALDA DISTRICT.

CORTEZ MINE.—Esmeralda *Herald*, Feb. 11: The more work done the better and more encouraging the prospect. The drift toward the Utah on the lower tunnel level shows a solid ledge of high grade ore the full width of the drift. In the incline the ledge maintains its usual width. Rumor has it that more miners were to be put on next week, but Supt. Wells informs us that there is no foundation for such rumor.

GALENA DISTRICT.

PLUMAS MINE.—Lewis *Herald*, Feb. 8: Capt. Dahlgren intends thoroughly exploring the Plumas mine in Galena. The purchase money is on deposit, but before accepting it, Capt. Dahlgren insisted that he should expend a certain amount of capital on the mine, and prove to the satisfaction of the purchasers that the property was as represented. A force of men are now at work on the mine, and at least $5,000 will be expended in opening up the property. We are pleased to see that some parties have faith in the mines of Galena, and hope to see our sister camp once more resume its place among the bullion producing camps of Nevada.

GRANTSVILLE DISTRICT.

THE CENTENNIAL MINE.—*Bonanza*, Feb. 11: Work on the Centennial mine is progressing splendidly. The ore continues to improve in all the levels in both north and south shafts. Men have been put to work in what is known as the west shaft, finding same grade of ore, which as developments progress, is proving one of the largest ore bodies in existence. Mr. Murphy commenced work on the croppings to east of all the other workings and found black metal distributed throughout them. Mining men of large experience were here during the week and visited this property, pronouncing it among the best in the State. The future, from present appearances, is certainly very bright—in a pecuniary point—for the owners. The Centennial is now all the talk here in Grantsville.

LEWIS DISTRICT.

STARR-GROVE.—Lewis *Herald*, Feb. 8: In the Starr-Grove mine, the Clark incline has been sunk 59 ft. The Bothwell winze in the south level sunk 21 ft and the south lower level advanced 28 ft during the month of January. There is an 8-ft ledge of ore that averages $74 in the Bothwell winze, with well-defined walls. The chimney of ore has also been struck in the lower level south, and is opening up big.

CHLORIDE.—The tunnel on the Chloride mine has been advanced 52 ft during January. The ledge looks better, but not solid yet, though the walls are well defined.

BETTY O'NEAL.—The new find in the Betty O'Neal still improves as opened up. Stopes are being opened and a winze sunk which will expose a large body of ore.

SUN BEAM.—The winze from the lower level of the Sun Beam mine is down 63 ft. The width of the ledge is not known—no crosscut yet having been made. The ore is of good quality, resembling the Morning Star ore.

MORNING STAR.—The Morning Star mine still holds its reputation as a bonanza. Capt. Dahlgren was greatly surprised at the improvements made during his absence by his able foreman, Mr. J. Kennedy. We are informed that the management will have from 50 to 100 tons of ore worked as soon as the ore can be packed from the mine to the forks of the canyon.

OPHIR DISTRICT.

ATTRACTING ATTENTION.—Reese River *Reveille*, Feb. 4: Old Ophir mining district, situated in the Toiyabe range of mountains, some 50 miles south of Austin, in what is known as Ophir canyon, is attracting considerable attention in mining circles. Within a few weeks past two parties, representing capital, have made a thorough examination of the mines there, and especially the Forlorn mine, which has a U. S. patent, and is owned by A. Lognoz. The latter named mine was originally located in 1863 by Murphy and others, and known as the Murphy mine, which produced its millions in silver. On the strength of the richness of this mine a 20-stamp mill was built and run for some time. Quite a flourishing town was kept up during the time. Like many other mining towns in Nevada, Ophir, after a run of three or four years, was almost entirely deserted, caused by a break in the ledge and more water in the mine than the machinery was able to handle. The mill, hoisting works, etc., were finally taken down and moved to other districts. Some years subsequent to which, A. Lognoz relocated the old Murphy mine, and secured a U. S. patent to that and another location, and for several years has been to work on these properties extracting ore, which he has had worked at the Manhattan mill. The first-class ore yielded over $300 a ton. Altogether he has done well, and is still taking out high grade ore. He is now in a fair way to sell his interests in Ophir canyon to capitalists for a good round sum. Should the sale be consummated, and necessary machinery erected to work the mine, that district will be heard from in a few months.

PUEBLA DISTRICT.

THE PUEBLA COPPER MINE.—*Silver State*, Feb. 11: J. C. Wear, of San Francisco, is the owner of several copper mines out in the Puebla district, northwest from here. There is said to be large quantities of sulphuret ores in sight in some of the mines, but they are not worked, as such ores cannot be reduced at the mines, and the distance from the railroad makes it expensive to ship them. In one of the mines a brownish ore is found which, it is said, can be readily smelted in a water-jacket furnace. Mr. Wear, who has been in San Francisco for some time, has shipped here a rock breaker, a turbine wheel to run a blower, and other machinery for a furnace which he is going to erect at the mine for the purpose of smelting the ores.

ARIZONA.

ALTA.—*Pinal Drill*, Feb. 11: Far up above this cluster of mines, 4,200 ft above sea level, is the Alta, which was located in 1881, by White, Goodfellow and Vernon. There has not been much work done in it, but the vein is clearly exposed in an open cut, or short tunnel, a short distance from the prominent outcropping. There is a considerable quantity of this ore in sight, and the Alta bears all the indications of being a mine. We draw attention to these locations, prompted thereto by the constant inquiries that come to us from the various cities on the east of the mountains wishing information concerning mines and prospects surrounding the Silver King, of Pinal. There are many others that deserve mention, and which, from time to time, we will describe, as fast as we can visit them.

OXFORD AND DOVER.—The tunnel in the Oxford is now 50 ft long, and shaft on the Dover 42 ft deep. At 50 ft they will run a level, on the vein, towards the Oxford, and also sink to another 50 ft, when another drift will be started in the same direction. The Queen is extracting good ore and constantly improving. Mr. Scott is now superintendent of the Wideawake Co. Work is shortly to be resumed on the Lewis mine, the property of the Lewis Con. Mining Co. Work has commenced on the Pilot on the Josephine ledge. It is owned by Messrs. J. O. B. Gunn and John Champion. Great activity exists in the Mineral Hill camp. We are constantly receiving rich specimens from new strikes and splendid ore from lower levels.

PECK.—Prescott *Courier*, Feb. 4: We learn from what we believe to be a reliable source, that all the claims which have heretofore interfered with the working of the Peck mine, have been amicably adjusted, and that there is not now a single case against the Peck Mining Co calling for the action of the courts. The adverse claim against the Peck mine, which involved the title to some hundred ft of ground, has, we understand, been withdrawn with the others. Now that litigation over the mine has ceased, there is no longer any good reason why it should not be worked as in former years, and contribute its quota to the prosperity of Yavapai county.

ELLSWORTH DISTRICT.—Cor. Yuma *Free Press*, Feb. 10: Some new and valuable mines have been found and the old mines are developing beyond expectations. The Socorro, belonging to the Oro M. & M. Co., is turning out high grade ore, and the whole lodge will mill at a good profit. The main shaft is down about 50 ft and the ore is steadily improving with depth. The Oro, which is the property of the same company, looks extremely well. At a depth of 65 ft water has been struck in the shaft, which was something surprising to every one, but gives new life to the camp, as we can now calculate on an abundance of water for hoisting and reduction purposes, without expense of transportation. So far the ore below the water line is free milling, containing an exceeding small percentage of sulphurets. Developments in the Yellow Jacket mine are creating a great deal of excitement, uncovering a body of ore as fine as once would care to see. The shaft is down 25 ft showing a 3-ft ledge gradually widening with depth. The Good Luck is another mine which is coming in the front and will, in time, show we have silver as well as gold ledges. The ledge is large and assays well in gold and silver. We have so many mines here that it is impossible to mention them all in the brief space of this or any reasonable letter. In fact there is no place in Arizona where there are so many, and when capital once takes hold of this district it will prove to be one of the leading ones of Yuma county, and even the territory. The whole camp is busy and all are doing their best without waiting for capital or any man to do their work.

GOLDSMITH.—Dos Cabazas *Gold Note*, Feb. 4: The Goldsmith mine, belonging to C. W. Barrows & Co., situated at the west end of town, bids fair to make a good mine. The shaft is down 50 ft with well-defined walls of slate and ledge, average 2 ft wide, the assays running as high as $120 in gold and $20 in silver. Work has been suspended on account of water and will be resumed again as soon as the necessary pumping and hoisting machinery can be had from San Francisco. The Pepper Sisters mine, belonging to the same parties, situated also at the west end of town, shows flattering prospects. They have a well-defined vein of 3 ft in width that assays well in gold.

TOMBSTONE DISTRICT.—Tombstone *Epitaph*, Feb. 13: In the Old Guard they are prospecting and clearing up the mine. An upraise on the pay streak along the footwall 30 ft northeast of the shaft on the 90 ft level is in splendid ore.

VIZINA CON.—The drift on the 420 level is now in 109 ft. The drift running west from the Sumner drift is now in 50 ft in ore of good quality. Sinking winzes on this level, which is now down 12 ft in porphyry and low grade ore. The other drifts and stopes are looking as well as usual Raising and shipping about 20 tons a day. The Yreka shaft is down 54 ft, still in hard cement.

BOB INGERSOLL.—Drifting in ore on the 300 level and sinking on the winze from the 73 level, connection from which will be made with the old main shaft of the Blue Monday recently conceded to the Bob Ingersoll.

GIRARD.—Before our report the shaft of this company will be at work. Should the quicksilver arrive today, as expected by Supt. Woods, the stamps will probably drop on ore on Monday.

WORONOCO (San Diego) M. Co.—Main shaft down 347 ft, having made 7 ft last week. South drift on the 266 level carbonate still holds, and are sacking the ore. The ledge has widened to about 4 ft; made 10 ft in this drift during the past week. Taken as a whole, the mine looks quite as well as at the last report.

RICHMOND BASIN.—*Silver Belt*, Feb. 14: All miners at Richmond Basin are steadily at work. Joe Brewster, in that immediate neighborhood, is sinking a 100 ft shaft on his Dundee mine, and when completed will drift on the ledge. O. W. Sharp is taking good ore from the Victoria mine. Risbridger, Campbell and O'Neill are working assessments for 1882. Mack Morris, besides stoping on the 400 and 500 levels, is deepening shaft to 600 ft.

COLORADO.

MINING IN PITKIN.—*Mining News*, Feb. 11: The most important occurrence to our camp took place last Monday, and was the signing of a contract by Dr. Vance with a friend residing in Missouri, who is a well-informed gentleman, with sufficient capital to carry out the enterprise. The contract is for a 10-stamp mill, to be erected as soon as it can be freighted to this point. The contract signed is a perfect and very important paper, and settles the matter of a mill for the Gold Belt. The agreement is briefly noted as follows: "Dr. Vance has deeded to the party mentioned a half interest in all of his mines in the district, in lieu of which the doctor becomes a half owner in the mill and will assist in its operation." Among the properties mentioned in the transfer were a third interest in the celebrated Wonderful and a half interest in the noted Dodson extension, 2 of the richest and best mines in the entire district. The gentleman from Missouri has made a splendid and safe investment which we are sure he will not regret. The mill will be erected on Spring gulch, three-quarters of a mile above the Sultana crusher, and will be accessible to all the principal mines of the Gold Belt.

IDAHO.

COMING IN ALREADY.—Wood River *Times*, Feb. 8: Four prospectors came in on the Blackfoot stage last Monday, from Colorado. They will make their headquarters in Hailey, so as to be in sight of the mountains where they intend to prospect next summer. They say that there will be a large immigration here from Leadville and other Colorado camps this spring. Quite a number of men who prospected on Wood River last summer have already arrived, or are on the way in.

WORK RESUMED ON LITTLE WOOD RIVER.—Wm. Thompson, an experienced mill superintendent, miner, and prospector, has gone out to Little Wood River, to take charge of the Solid Muldoon and other property of the Little Wood River Mining and Smelting Co. Mr. Thompson left Hailey yesterday, with 4 miners, he having come to this place for a bill of goods. He will add to the force at work as soon as he can find room for men.

THREE HOISTING WORKS IN THE COUNTRY.—The Mayflower hoisting works were started up a few days ago, and are running smoothly. This makes the third hoisting works in this section, the other two being at the Bullion and Ornament mines. By spring, the Eureka, Jay Gould, and other mines will doubtless also have hoisting works.

NORTH STAR.—Idaho *World*, Feb. 10: The boys have struck it big in the North Star, on Shaw's mountain. The tunnel that tapped the ledge a few weeks ago disclosed two seams—the one on the foot wall 3 inches wide, and the hanging wall seam a foot in width. A drift is being run east from the tunnel. In the face of it, 20 ft from the tunnel, the seams have widened to 5 inches and 3½ ft in width, respectively. Mr. Plowman is of the opinion that the ore of both seams will mill between $10 and $20. Chunks of sulphurets weighing 400 or 500 lbs. have been taken out. The vein is about 5 ft between walls. No one in Boise county has exhibited more pluck and perseverance in delving for quartz than has Plowman. It now looks like he will be liberally rewarded.

MAMMOTH.—Four men are at work in the Mammoth mine, on Summit Flat, owned by Hon. Ben. Wilson and Henry Whitney. They are raising chutes. One reached the surface a few days ago. It was run up 250 ft. Two others have been started up. After completing the chutes the mine will be opened in new places. A tunnel has been run a thousand ft—300 to tap the ledge, and 700 on the vein. The vein varies in width. In places it is 12 ft. wide. Every foot that has been worked has paid. The mine has not been stoped for more than 150 ft in length, so there is an immense body of ore above the tunnel yet to be mined. Mr. Whitney tells us there are 2 or 3 other good mines on the flat, 1 the Goodwin mine. It was worked several years ago and paid well.

MONTANA.

SUMMIT VALLEY NOTES.—*Inter-Mountain*, Feb. 14: The Box fire box, which has been in use in the Silver Bow mill for some time, is giving satisfaction. The Silver Bow mill is again running to its full capacity. The four Butte smelters are shipping daily large amounts of matte and black copper. The ore body in the Bell of Butte continues to gratify the owners, and is producing a steady supply of good ore. Some magnificent specimens of wire silver were taken out yesterday. In the La Plata the work of development continues, and the expectation is that in a short time a fine ore body will be tapped. At the Modoc the shaft is now down some 130 or 140 ft, and within the past day or two a well defined and fine vein of copper silver ore has been struck, more promising than anything yet reported in the mine. The ore recently struck is said to go 50 per cent. copper and is shipped immediately for reduction. In the Morning Star work is being prosecuted actively in the west drifts of the 100 and 200 ft levels. On the lower level the face of the west drift is in 225 ft. On the upper level a very rich ore body showing native and wire silver in considerable quantities, has been developed in the past 48 hours. The Magna Charta now shows an activity that is really remarkable. Just 1 week ago Thursday, work was begun sinking the new or east shaft. The material encountered was granite, some of it quite hard, yet in spite of this in 7 days the new shaft had reached a depth of 50 ft, progress unprecedented in the annals of Butte mining.

THE ST. LAWRENCE.—The copper-silver ores of this district furnish a strong title to the claim that its prosperity will continue to increase steadily. The St. Lawrence is a mine recently opened up, and shows a fine body of copper-silver ore. On the 100 level a body of ore 8 ft wide assays 29 per cent. copper. On the 225 level the ore body is 25 ft wide, and of this 16 ft give an average assay of 46 per cent. copper. On the 525 level the vein is 50 ft wide.

THE MOULTON.—Mr. S. H. Macumber has a large force of men now at work day and night completing the setting of the new Cornish pumps. The work will probably be done by the middle of the current month, and in the magnitude of the machinery used and the complicated system of operation surpasses anything heretofore known on the Pacific coast, outside of the Comstock. When this is done the 400 and 500 levels will be thoroughly developed. At present and for the past week work in the mine has been confined to the 200 and 300 levels on the center vein. The east drift on the 300 level is to the Alice ling; here raising and stoping are going on. The connection between the 200 and 300 levels is nearer the crosscut. The west drift on the 300 is in 250 ft, and from this point a crosscut is being run south for the main vein or grade ledge, struck in grading for the mill. A raise is also being worked here to the 200 level.

THE MOUNTAIN CONSOLIDATED.—The Miners' prospecting engine which is still used in the Mountain Consolidated hoisting works continues to do good service. The shaft is being sunk steadily day and night, and has now reached the depth of 140 ft. When an additional depth of 85 ft is reached, a crosscut will be run to the main ledge.

THE CLEAR GRIT.—The Clear Grit shaft is now down about 135 feet, and work is being pushed vigorously sinking it further.

NEW MEXICO.

ABBEY DISTRICT.—Socorro *Sun*, Feb. 12: There is no mistake but the boys have a good thing in the Abbey district, in the Caldonas Yesterday we saw on exhibition at Young's store a specimen from the shaft now being sunk at the intersection of the Aurora and Little Abbey mines, weighing 80 lbs. The prospects of the mine are seemingly as good as any in those mountains. The boys have commenced tunneling in on the vein. Neither wall has been found and they are unable to tell the width of the vein, but it is very large. There are about 35 prospectors in the district.

BLACK RANGE.—Judge Adams is working 3 8-hour shifts on the Alaska mine, and it is understood that he will run the shaft which is now down about 200 ft, to a depth of 500 ft before he stops. This company has now about 900 ft of work on their different properties. The Buckeye and Braxton mines are working double shifts. On the new belt, on the head of the South Fork, there are several men working with good results, and the indications are that some of the best property in the range will be developed on this belt. Considerable excitement prevails in the Cuchillo Negro mountains over recent rich copper discoveries in that range.

MIMBRES M. CO.—*Silver Brick*, Feb. 6: During the year just closed the enterprise of the Mimbres M. Co. has been manifested in a manner highly creditable to the management, as will appear from the subjoined statement: The average number of men employed during the year was 250. The pay rolls exhibit a monthly expenditure for wages of $15,000. The sum of $80,000 has been expended in permanent improvements. The amount of bullion shipped amounts to 170,000 ozs. One and one-half miles of openings have been made in their mines. Additional ground has been added to the original purchase. Two large buildings have been erected at the mine. The shipments of bullion have been constant, and aggregate to the amount above noted. The company's works have also produced a good showing of bullion from ores mined at the McGregor, Commercial and Satisfaction mines, which has been shipped by the parties owning the ore.

BULLION.—*New Southwest*, Feb. 14: The Adams Express Co. shipped for the Mimbres M. Co., this week, 6 silver bricks, having a total weight of 334 lbs., valued at $8,250.

OREGON.

WOLF CREEK.—Jacksonville *Miner*, Feb. 10: A company of gentlemen from abroad styling themselves the Pacific M. Co., has become possessed of some excellent ground on Wolf creek, and have let a contract for digging quite a long ditch to the Chinamen recently taken down by Wm. Eaton and P. Boschey. H. B. Morse is the superintendent.

LIGHT YIELD.—Few miners have done comparatively anything, and unless they have a favorable spring, the yield of gold dust will be much lighter than usual. Some have been able to do a little work late in the day, with the aid of reservoir heads, but the prolonged cold snap has generally prevented any extensive operations.

BREAK.—Ben. Haymond, of Rock Point, who was in town yesterday, informs us that the damage resulting from the break in Hays & Magruder's reservoir, last week, including loss of time, amounted to about $1,000. Wm. Ludington, who has charge of the mine this season, lost no time in making repairs, however, and operations have already been resumed.

WATER.—Snow, intermingled with rain, commenced falling Wednesday morning, and continued until yesterday noon, when it started in raining earnestly. This has furnished the miners a fine supply of water and they are making the most of it. A little snow still remained on the ground as we went to press, but was melting rapidly. The prospects for a fair season are good, unless cold weather should again intervene. Jacob Klippel & Co., of Poorman's creek have been sluicing a few hours each day with the aid of reservoir heads. A. W. Sturgis & Co., of Jackass creek, have resumed drifting, as there was hardly enough water for ground-sluicing at the time. The miner is happy in anticipation of a change for the better, since the weather broke, and still hopes to make a good run this season. The Applegate Gravel Co.'s elevator, received last week, will be put into position as soon as the weather is favorable. Pfeil Bros., of Quail's creek, have struck some very good prospects and they believe that the rich channel of olden days has been found again. We hope so. W. S. Brodbeck and Lannee Klippel, who have a claim on Dividend Bar, came to town Wednesday. From them we learn that the cold snap caused a total suspension of mining operations.

Locating Mineral Veins.

A Clear Statement by an Arizona Judge.

In his charge to the jury in tbe Contention Head Center suit, recently decided at Tombstone, Arizona, Judge W. H. Stilwell said:

Mining law was made for miners. It ie plain and simple. It provides that a mau or a number of men may make a location of certain mineral lands, after they have found a mineral vein, lode or ledge. You have listened to the testimony of miners of great experience, and of men learned in geology. Yon may find some difficulty in coming to your verdict to reconcile all the testimony that you have listened to, and I will state hers that the mining law is simple and general. It would he difficult to give definitione, euch as yon have listened to, that can be fully applied in this or other cases. Therefor the definitions of words found in ouretatutee are very limited, in fact no definitions regarding a vein, ledge or lode. Courts must be careful of giving definitione of veins, lodes or ledges, and trust very much to the wisdom and good judgment of the jury, after listening to the testimouy, to find what is a vein, ledge or lode in the case they consider. Miners usually follow ore that will pay, or what they thiuk will lead them to ore that will pay to mine. There are many little seams, as you have heard testified to, running out from large bodies of ore. Some may pay to follow and eome may not. What there is of them may he pure, rich and valuahle, and yet not pay to follow, aud I will add that some of the testimony that you may have listened to, as a matter of science, may he clear in logic, rich in learuing, hut as miners it may not pay you to undertake to reconcile all the facts or opinions that you may have listened to hefore fiuding your verdict. You are at liberty to consider such part of the testimony as will enahle you to arrive at the facts in the case. It will he quite impossihle for you in this case to reconcile all the testimouy I have illustrated, though as a matter of science the fine distinctions and definitions you have listsned to may he true and interesting. A lode, vein or ledge, so far as eatisfying the law is concerned, may he defined as a mase or hody of mineralized or metalliferous rock in place, surrounded hy other different rock. That is ahout all the definition that I feel can he given from the hench that will apply to many different cases.

I am of the opinion that the coloring on the map, takiug these three long epots, are in the meaning of the law, in place. Yet you had testimony hefore you that they are not where they originally were—that they had heen faulted and moved. The mineral, we were told, is not where it wae wheu the vein, lode or ledge was formsd, yet they are in place. By rock in place, we mean rock that hae not heen changed hy the elements or gravitation. In coming to your decision as to what is a vein, if you find that there is one here, and whether it embracee the entire porphyry dike, or, simply, as is claimed by the defendants, the mineral embraced within clay selvages, which they call walls, you are at liherty to consider the formation of those other veins, lodes or ledges in the Contention mine. If you are convinced that those veius were formerly one vein, but have heen faulted and eeparated hy forces in the earth, you may consider and compare them as to their general formation. In passing npon this vein, ledge or lode, it is for you to say what is the houndary of it and of what it consists. If yon come to the opinion that the vein, ledge or lode is simply that described hy the defendant, then in making the lines, as I shall hereafter instruct you, you must be guided as to where that vein courses or takes its strike. If you come to the opinion that the porphyry dike is the vein, you shall he guided by the size of thet and the strike it takes, in plecing those lines ahout which I will instruct you.

Flesh Worms on the Face.—The hlack points, flesh worms, technically termed comedones, which are found in the face, and especially near the noetrils, are not at all produced hy the accumulation of the particles of dirt or dnst, ae has generally heen hslieved, hut hy pigmentary matter which ie eoluhle in acid. It is known, in fact, that hlack comedonee which accompany and often appear not only on pereone exposed to duet, or rather careleee of their pereon, hut also on chlorotic youug girls who live in good circumstances. Besidee, obeervation ehowe that the diecoloration not only exiete on the surface of old comedones, hut descende alwaye to the lower parts. Accepting thie fact, Unna has ueed euccesefully acide in the treatment of comedonee. He generally prescrihee: Kaolin, 4 parts; glycerine, 3 parts; acetic acid, 2 parts, with or without the addition of a emall quantity of eome ethereal oil. With thie pomade he covere the parts affected in the eveuing, and if need he during the day. After eeveral daye all the comedonee can he eaeily expreesed, moet of them even come out hy washing the parte with pumicestone eoap. The eame reeults can he ohtained hy handaging the parte affected for a long time with vinegar, lemon juice, or diluted hodrochloric acid. The anthor concludee hy eaying that the acids act like coemetice, ae they transform the hlack color into a hrown and yellow ehade and destroy it gradnally altogether; they produce a quicker deequamation of the horny hed which intérrnpts the exit of the cnmedonee and hringe to the eurface the glandular openinge.—*Archives de Virchow.*

Electric Light on Railway Trains.

A correspondent of a Sheffield (Eng.) papsr, writing from London of the recent trial of eleotric lights on the Pullman train of the London, Brighton & Sonth coast railway, eeys:

There ie no douht whatever on the point that thie, apart from the question of cost, ie a decided euccess. It is easily manageable, and diffnses through the train a pleasant, equable light, scarcely less agreeahle than daylight. It is turned on and off with instantaneoue effect ae the train enters and leaves a tnnnel, aud of course is kept hurning the whole of the time duriug the night journeys. The electricity is etored in a numher of lead plates, which are kept in water in iron hoxee in the gnard'e van. There are two lots, one at either end of the train, and two mechanics in charge of them. This discovery of ahility to etore electrioity for application to lighting purposes seems to carry the discovery further than anything since it was introduced. It gets over many difficulties which seemed insuperahle—especially the important one of the great waste of power which is illustrated every night at the Savoy theater—and would he applicahle to the intrndnction of electricity for household use. At the Savoy, when the exigencies of the play require that the lights should he turned down in the auditorium, there is no cessation of the enormoue power required to produce the full effect. What happens is that, hy a mschanical contrivance, the electricity is carried off from the light and goes to waste. With this system of etoring, electricity can he used just like gas, as much or as little as people chance to want. Another great advantage is the freedom from jumping inseparahle from tbe action of the driving power of the steam engine, or of tbe motion power of water. The lights on the Brighton train hurn just as eteadily es gas, an effect not in any way ohtained where the light is maintained directly hy the driving power of steam. But, after all, the question of gas vs. electricity will resolve itself into one of cost, and it is here where gas will inevitahly hold its own. The fundamental principle of the electric light is, that for a given exertion of power you obtain a given proportion of light; neither more nor less. For every hour it is hurning, there will reqnire a certain exactly-ascertained proportion of revolntions of the steam engine, and therefore, if the whole town is lighted, it can be done only at a strictly proportionate expenee to the lighting of a eingle house. Asto what that expense will he as compared with gas, the Brighton train would, if we had an idea of the actnal figures, afford a precise means of information. I met on the train a well-known gas engineer, attracted, like myself, hy the novelty of the experimeut. What the electric lighting cost, he was not able to say; but when we take into account the capital eunk in plant, involving a steam engine with the necessary huildings, consumption of coal and necessary employment of skilled labor, it must he eomething considerahle. Against tbis is the hare fact tbat the Brighton train could be lighted with gas for the douhle journey at tbe cost of 10d. It is a physical impossibility that electricity should ever come anywhere near this, and that prohahly explains the eingular phenomenon, that at the time when electricity ie making many conspicuous advances in puhlic favor, the value of gas shares is not only steadily maintained, hut is actually rising in the market.

Native Silver in Iron Ore.

At a recent meeting of the Anstrian Society of Engineers, specimeus of native silver were shown which occnr under peculiar circumstances on the east coast of Spain, in the province of Almeria, Las Herrerias, near the Mediterreneau. The Phœuiciane and Romans mined in that locality, hnt prohahly stopped work during the fifth century. Mining now is almost entirely confined to a hill ahont 100 ft. high, consisting almost entirely of iron ore, a hematite more or lese mangauiferons. Through it run several veins of heavy spar. Along the northern, eastern and sonthern parts of this hill, which stretches toward the north for a distance of ahout 5,000 ft., the iron ore is covered hy a hed of marl, the so-called *laguena*, which has a thickness ranging between 160 ft. and 500 ft. Below the marl, and ahove the iron ore, is a bed of "flint" ahont 1.5 ft. thick. In placee tbie flint ie fissured and then forme rounded fragments, which have the appearance of having heen acted npon hy long rolling in water. In the northeastern part of the marl are eeveral hede of galeua, low in eilver, which are called *mantos*. The latter have heen worked for 40 years, no one having a suspicion of the rich eilver oree lying helow them nntil that metal was diecovered in the layer of flint. The eilver, which ie generally native, occure more frequently in the heavy epar, and ie occasionally found, too, in the iron ore proper, eepecially wben it ie lower in manganeee. The texture of tbe eilver is peculiar, it having a eandy appearance, and this, comhined with the rounded shape of some of the fiint, led to the idea that the whole might poeeihly be the result of the destructiou of dietant veine carried to the preeent eite hy water. Againet thie theory of an alluvial depoeit, it ehonld he noted that the vicinity ie croseed hy many dykee of trachyte and hasalt. The marl contains ehelle and the teeth of fieh helonging to the miocene, the former often showing a crust of galena.

A Strong company hae been incorporated to develop and work the Red Rover mine, Calico district, San Bernardino county.

Mills and Smelters to be Started up During 1882.

There are now in operation in this district (Butler, Montana), the following mills: Alice, 80 etamps; Silver Bow, 30 stamps; Lexington, 10 stamps; Dexter, 15 etamps; Moulton, 40 etamps; Clipper, 5 stampe. Of emelters, there are in operation the Montana and Colorado, daily capacity, 18 tons; Montana Copper, daily capacity, 50 tons; Parrot, daily capacity 50 tons.

Dnring the year just hegun, the following enterprisee will he etarted: Two 40-etamp mills hy the Lexington Co., one of which is now rapidly nearing completion; a 20-stamp mill hy the Clear Grit Co.; a 25-ton emelter hy the Sheridan Gold aud Silver Mining Co.; a 20-stamp mill by the Stevene Co., and, in all likelihood, mills for the treatment of ore from the Anselmo, Salisbnry and Anaconda. It is also in contemplation to huild a 40-stamp mill to treat the product of the Monntain Con., which property hes just heen incorporated. The ownere of the Gagnon will certainly he disregardful of their hest interests if they longer delay the erection of a emelter. They have already paid out an enormous fortnne to have Gaguon ore treated, and now that a decision of the U. S. Supreme Court has given tbem a clear title to the property, and that the ore is richer and more ahundant than ever bsfore, tbere is every reason to helieve that Col. Thoruton and his wide-awake partnsre will proceed at once to make arrangements for the building of a 50-ton smelter.

On the day of this issue of the *Holiday Inter-Mountain*, or a few days thereafter, the 50-ton smelter of the Bell Mining Co. will be fired up on the product of one of the hest minee in the western Territories. A description of mine and emelter will he fonnd in another column.

In addition to all the uew enterprises contsmplated, the capaoity of the works already established will he very largely increased. At the smelter of the Colorado company two etacke and a 50-ton concentrator will he fired up. They will double the capacity of the works, and will ewell tbe outpnt next year to fully $2,000,000. Four new furnacee are being erected under the roof of the Parrot company's smelter, and extensive improvements are contemplated at the Montana copper company'e worke. W. A. Clark etates that in the early spring it is his intention to add a roaster to the Dexter mill, by which means tbe treatment of hase ore will he possihle. It ie also authoritatively stated that the bnilding in which the Howland pulverizer now lies emhalmed will he fitted up as a 10-stamp mill.

From the foregoing incomplete account of the enterprisee to be started in thie camp next year, all people who have not enjoyed a trip to the Silver City and who are desiroue of securing a new home where they can permanently and profitably reeide, can gain an understanding of the extent of the hoom wbich will strike this camp next summer—the greatest, richest, and most productive mining district of the world.—*Inter-Mountain.*

Boundaries of Mining Claims.

In his charge to tbe jury in the Contention Head Center suit, at Tombstone, Arizona, Judge Stilwill said:

"Regarding the locetion of miniug claims, to make a location, a miner is not compelled or permitted, until he finde a mineral-bearing vein, ledge or lode, and until he is fully setisfied as to its course and strike, tbat he may locate the claim conformatory thereto. If tbe location is made hefore the etrike of a vein is or can be ascertained, the principle that the law does not require an impossihility, cannot he nsed as an excuse for following a vein after it materially departs from the exterior houndaries of a mining claim and does not return to it. A man may locate a mining claim, if he chooses, hefore he learns the true strike of his vein or ledge; and the law providee what minerale he may extract therefrom. If he makes a mistake in bis location, he cannot he excused on the principle that the law does not require an impossihility, and he permitted to follow hie vein or ledge hefore it strikes out heyond the side boundariee of his claim. He mnst abide hy what the law saye ie embraced in the honndariee of his claim, and ahout which I will more particularly instruct you. In thie caee, I inetruct you that it is your duty to give to the plaintiff all that you would coueider him entitled to if the property claimed hy the defendant helonged to the United Statee. That ie to say, if I locate a farm, the houndary of my farm ie not different by reaeon of the fact that the property adjacent may helong to the United Statee, or any individual; and I am of the opinion that if the property helonging to, or claimed hy the defendant, helonged to the United Statee, the plaintiff would have no right in law to go any farther heyond their eide linee than they have in thie case. If the defendants are *bona fide* enhsequent locatore. The law provides that the location shall he made euhetantially parallel with the etrike of the lode or vein, and that the end linee shall he parallel. It ie eo difficult to do thie in all casee, that if the line or rim entere the claim at one corner under the end line and croesee diagonally through the claim and ont under tho other end line, it ie held that the location ie good, and the owner of the claim cannot he dieturhed, and may follow that vein downward in ite dip, to any extent, even though it ehould so far depart from a perpendicular in ite conrse downward ae to extend onteide the vertical eide linee of euch surface locations.

The Demand for Zinc Ores.

There is a large demand at present for zinc ores from smelting works in New York, Philadelphia, Bergen Point, N. J., and other portions of tbe Middle States. For many years zinc mining has heen prosecnted extensively in New Jersey, Penusylvania and various portions of the South and West. With the increasing metal demand which ie the outgrowth of the wonderful busineee prosperity throughout the country, zinc has received ite proportionate ehare; and as new uses have been discovered for this valuable and indispensahle metal, the demand has become enormous, leading to a remarkable appreciation in prices. At the same time the supply has been much decreased by the reduction in output of ore from many of the minee which formerly oontrihuted very largely. It is understood the zinc mines of New Jersey and Pennsylvania are becoming exhausted, and that it will he necessary in the future to look elsewhere for these ores. The smelters have accordingly turned their attention tbis way, and numerous representatives have visited the mineral fields of Maine and made thorough and exhaustive examinations. These parties will buy zinc oree directly on the dumps, and will pay haudsome prices for large quantities of these ores. One of the large smelting works, we are informed, has already changed over their emelters especially to treat Maine zinc ores, and it is reported if encouragement is offered a large firm will remove the scsue of their operations and erect costly and elahorate zinc works at some desirable location in our own State. The Lsbigh Zinc and Iron Co., of South Bethlehem, Pa., John Price Wetherell, manager, are operating a mine on Cutler Head, Washington county, for zinc. Day and night crews are heing employed; the shaft has reached a depth of ahout 40 ft., and the prospects are excellent. It is prohahle that a large number of outside companiee will visit our State and mine the zinc deposits which exist in many of the towns along the cosst of eastern Maine. The appreciation in value and large demaud for zinc ores will eurely very materially advance our miuing interete and he of great aesistance to many of the mines now being actively worked. In openiug our mines much ore has been encountered carrying large proportions of zinc, and thie has in the past heen considered practically worthless; hut now this ore at once comes into prominence, and it ie found that it bas considerable value. There is no reason why many of our mining propertiee cannot he opened and thoroughly developed, enough heing received from tbe sele of zinc ore to pay all expensee from the grass roots. This ie a most encouraging feature for the Maine mining interests.—*Maine Mining Journal.*

Bronzing Zinc.—Good results are said to he obtained from thie metbod of ooppering and hronzing zinc: Prepare a solution of 15 parts of hlue vitriol, and one of 19 parts of cyanide potassium, and mix them hoth together. Incorporate this liquid well with 160 parts of pipe-clay, and ruh the resulting semi-fluid, hy meane of a linen rag, on the previously cleaned ohject. For hronzing, take 15 parts of verdigris, 19 parte of cream of tartar and 30 ot crystellized soda; reduced them to powder, and dissolve them in the necessary amount of watsr. Mix this liquid with 160 parts of pipe-clay, and then proceed as ahove directed. This is another process: Take 15 grammes of hlue vitriol, 20 of celcined soda and 32 cuhic csntimeters of glycerine, and when these eubstances are thoroughly incorporated mix the paste thns ohtained with 80 grammes of pipe-clay. The mixture is to he applied as ahove described.

Effect of Antimony on Copper.—It bas heen found that the one-thousandth part of antimouy converts first-rate hest selected copper into the worst conceivahle, so had as to he fit for hrass only, and that one four-thousandth part rednces it from "hest eelected" to "tough ingot" quality, and one sixteen-thousandth sensihly deteriorates the copper. It has, moreover, heen found that one-thousandth pert of nickel, cohalt, hismuth, arsenic or phosphorus, reducee "hest eelected" to "tough ingot," while nickel and arsenic in comhination and mixed in the proportion of one five-hundredth, make copper unfit for brass, thus ehowing that two eubstances in comhination may produce a far more hurtful effect than either of them separately.—*Iron Age.*

To Gild Steel.—This metal may he gilded hy means of a eolution of gold in ether. To do this a quantity of gold ie diesolved in nitro-muriatic acid, and then boiled until the liquid evaporatee, when the residue is diseolved afreeh in water, to which is added three timee ae much eulphnric ether. The liquid is then left for 24 houre in a bottle, tightly corked, after which time it will he eeen to float on the eurface of the water. If the eteel ie then dipped into it, it will hecome gilded immediately, and if deeigne have heen painted on the surface of the metal with any varnish, a heantiful epecimen of a eteel and gilded eurface is ohtained. For other metale the galvanic procese is employed.

The Gold Hill *News* of Feh. let eaye: There ie a new engineer at the Alta. The one on ehift yeeterday afternoon ran the cage into the eheavee. Denis Callahan, the pumpman, wae on the cage, but he jnmped off, catching on the croee hars of the gallowe frame. He eaved hie life by hie presence of mind.

The Engineer.

Wonderful Ocean Steamships.

We have already made a brief allusion to a new mode of constructing steamships which has recently been proposed. We now give the following more particular description from a late number of the Boston *Transcript:* A wonderful story, beside which the narrative of the adventures of Sinbad, the Sailor, is dwarfed into nothingness, is that told to a New York reporter of the wonderful steamships to be built on the Hudson for ocean traffic. In the first place, the ships will have no maste, and therefore, all "top hamper," such as spars and sails, will be dispensed with. The first boat, which it is expected will be launched before the first day of next May, will be 147 ft. long, 21 ft. beam, 16 ft. deep, with 5 ft. 3 inches draft forward, and 11 ft. aft. The peculiar feature of her construction will be, that her deck will be completely domed, nothing being in sight but the upper portions of the pilot-house, smoke-stacks and ventilators. The pilot-house will be entered from below, and, being made of convex glass an inch thick, set in steel framework, will give an unobstructed view in all directions. The advantage claimed for this invention is, that the amount of obstruction to the wind and waves is reduced to a minimum. The machinery will occupy less than half the room now required on most steam vessels, and its weight will be one-third less, but its power will be more than five times as great as that now in use. The saving in stowage and weight will be made by using steel for the construction of every portion. It is calculated that the boilers will withstand a pressure of 1,000 lbs. per square inch, with a working pressure of 650 lbs. to the same surface. But why go farther into the dry details of revolutions, and size of propellor blades and all the rest of it? The possible result is all that interests the general public. The claim is made that, aided by the dome and the thousand lbs. pressure, and the steel boilers and so forth, the run from Boston to Liverpool will be made inside of five days. Subsequent ships will be 400 ft. or more long, with other dimensions in proportion, and furnished with boilers which will store the power of 16,000 horsee, and never think of blowing up short of 1,000 lbs. pressure per square inch. The *Servia*, by the way, being allowed to carry from 90 to 120 lbs. pressure to the square inch, the unscientific reader will see that these new wonders of marine architecture will be something tremendous.

Extraordinary Disappearance.

The German Admiralty decided last year to erect a new lighthouse near the mouth of the Weser, in the open see. From the exposed position, the depth of water (26 ft. at low water), and the nature of the soil, it appeared expedient to sink the foundations by means of compressed air and concrete caissons. The lighthouse was to be erected on a single caisson, 44 ft. by 33 ft. in area, with a working chamber of the usual hight, covered with brick arches, and made tight by a layer of concrete 4 ft. 6 inches thick. The bottom part and casing, to the hight of 40 ft., were erected on land, and floated to their position, fitted with the boiler, engine, air compressor, and other working appliances. The sinking then began, and was continued till the 11th of October, when the bottom of the caisson was 70 ft. below low water level, or 44 ft. in the soil, the casing being then altogether about 82 ft. high, and the concrete inside having reached a thickness of 32 ft.

The work had to be interrupted at that date, the stormy weather making the conveyance of materials to the works impossible. The unfilled part of the casing was thoroughly stayed, and it was expected to withstand the winter's storms. The works had scarcely been left when a terrific storm broke loose. On the 13th the whole block disappeared at noon, in the space of about two minutes, a column of water shooting up after its disappearance. Approach was impossible till the 19th, when the report was found to be correct. The tower had completely vanished, without leaving a vestige of its existence in the shape of wreck behind it. By soundings' the bottom of the sea at the spot where the tower had been was found to be the same as before it was put down.

The cause of this remarkable occurence has not yet been satisfactorily ascertained. The soil last worked upon was firm sand, so hard that it had to be worked with picks. It is supposed that the sand did not extend much farther down, and had a substratum of hog, and that the tower, loosened by the shocks of the storm waves, had broken through the layer of sand and gravel, and been engulfed in the hog underneath. The weather has not yet permitted borings to be undertaken to ascertain the truth of this hypothesis. The loss caused is about $50,000, but fortunately no lives have been sacrificed.

The new ship canal which is to connect the Baltic and North seas, will save nearly 600 miles of the water journey now made around the Danish peninsula. The cut will be from Gluckstadt to Kiel, and the length will be about half that of the Suez canal, or about 50 miles. There are several small lakes lying in the way which will be utilized by the engineers, as was done in the case of the Suez cut. The work is to be undertaken at once.

Useful Information.

An Electrical Experiment.

A Cheap Toy, and Plenty of Fun for the Little Folks.

We sometime since published the following paragraph as something both curious and interesting.

"A curious electrical experiment is described in one of the French journals, as follows: A small pasteboard box is provided with a glass lid, which is coated on the upper surface with one or more thin layers of collodion, but not enough to render it opaque. A number of figures representing insects and the like, and made of cotton or sponge, are placed within the box. When now the collodion surface is rubbed with dry fingers in dry weather, the insects are made to move about in an interesting manner as they become electrified."

The Territorial *Enterprise* of February 7th, gives the following in the same direction, which will be found especially interesting to our young readers:

Over a year ago we published an account of this experiment. John S. Orndorf, of the firm of Orndorf & Adkison, book sellers and stationers, in wiping off boxes that had glass lids, discovered that particles of lint, bits of thread, paper and the like, flew up from the bottom of the box and attached themselves to the glass, moving about as though they were alive. Further experiment showed him that the same thing took place in the show-cases, when the glass of the tops was rubbed with a handkerchief, but on a larger scale. He made butterflies and other insects, some three inches long and two inches wide, of colored paper, also little balloons and a great many other things which, being placed in a show-case, performed in a really comical manner when the glass was briskly rubbed. The air here being dry and light, no collodion coating is required. The show-cases used in the experiment are eight or ten inches in depth, yet the artificial insects would readily hop from the bottom up against the glass and dart about from place to place. Often an insect would be seen to leave its place, swoop down almost to the bottom of the case, then rise and attach itself to the glass at another point, from one to two ft. away from where it had its first hold. Sometimes two or more of the insects would be seen to suddenly dart at one another, cling together and fall to the bottom of the case, as though fighting, and on touching the bottom of the case they would separate, and darting back take new places on the glass. When a lot of small insects made of the bright, artificially-colored mosses imported from Europe are used, the effect is very fine, and those who see the experiment for the first time can hardly be made to believe that the bugs, worms, butterflies and moths are not alive. The effect may be produced (in this climate) by laying a light of glass upon the lid of any ordinary paper box. The changes are almost as many and curious as those seen in a kaleidoscope.

How Artificial Teeth are Made.—The manufacture of teeth is a large industry. There are now 12 manufactories of artificial teeth, that produce every year 10,000,000 teeth, or one to every five persons in the United States. Half this number are made by one firm, founded in 1844. The total sales of teeth amount to $1,000,000 annually. The materials used are feldsper, kaolin, and rock crystal. The coloring is platinum, titanium and gold. The feldspar and cryetal are submitted to red heat and thrown into cold water. They are then ground in water until fine enough to float. Combined with the coloring, they are subjected to intense furnace heat in molds of brass, which are in two pieces, each molding one-half of the tooth. The process is delicate, and has many interesting details. In the earlier history of the art dentists carved the teeth which their customers demanded, and apprentices were often made useful in that way. The amount of gold used annually in filling teeth is $500,000. Lead was used from 1778 to 1833. There are dentists in New York who give, or say they give, diamond fillings, and in Paris they advertise to use diamond pivots and emerald plugs. The filling of teeth is aided greatly by labor-saving machinery and cunningly wrought tools. This country makes dental instruments for the world where dentistry is known. An ordinary outfit of instruments costs $500.

Preservative Paper.—Two new kinds of preservative paper have lately come into commerce in Europe. One is produced by dipping soft paper in a bath of salicylic acid and then drying. The bath is prepared by mixing a strong solution of the acid in alcohol, with much water. The paper is useful for covering apples, etc. The other paper, meant to preserve from moths and mildew, consists of so-called Manila packing paper, dipped in a bath and dried over heated rollers. The bath is formed of 70 parts spirit of tar, 5 parts raw carbolic acid (containing about a half of phenol), 20 parts coal tar at 163° F., and 5 parts refined petroleum.

Lighting Fires.—To avoid the disagreeable smoke and gas when a fire is lighted on a damp day, light a handful of paper or dry shavings on top of the coal before the fire is kindled. This produces a rapid draught, carrying off everything offensive.

Artificial Onyx.—Mr. A. Dreher has patented the following process for converting ordinary agate into onyx: The dressed stones are first placed into nitric acid, to extract the compounds of iron and other metals, then dried and calcined to remove the remnants of nitric acid. They are then soaked in a solution of 220 grains of caustic potash or soda in one litre of water until saturated, and washed in water. By placing them again in nitric acid and washing, the alkali is removed from the outer surface of the stones, after which they are dried and thoroughly calcined. The stones thus treated are completely bleached and white, while their outsides are rendered porous, so that they can absorb coloring solutions, which gradually shade off into white, as in natural onyx. They are finally engraved, giving colored reliefs on white grounds.

To Make Glycerine Leather Polish, mix intimately together three or four lbs. lampblack and one-half lb. of burned bones with five lbs. glycerine and five lbs. syrup. Then gently warm two and three-fourth ounces of guttapercha in an iron or copper kettle until it flows easily, then add ten ounces of olive oil, and, when completely dissolved, one ounce steerine. This solution while still warm is poured into the former and well mixed. Then add five ounces gum senegal dissolved in one and one-half lbs. water, and one-half ounce of lavender or other oil to flavor it. For use it is diluted with three or four parts of water. It is said to give a fine polish, is free from acid, and the glycerine keeps the leather soft and pliable.

Fat in Milk.—To determine the proportion of fat in milk, Prof. Soxhlet shakes up the milk with ether or potassa lye, so that the fat contained in the sample is completely dissolved. When the mixture is allowed to stand a layer is formed on the surface of the liquid, and from a comparison of the supernatant dissolved fat with the other portion of the contents of the vessel the problem may be solved. The specific gravity of the ethertal liquid is increased in proportion to the fat dissolved.

Good Health.

Dr. Alcott on Fruit as Food.—The purest food is fruit, next the cereals, then the vegetables, which are properly the food of animals. If it is necessary that animal food should be eaten, or because you cannot leave off that diet at once, then take it in its milder form—in the egg or oyster. The change which would be wrought by such a regimen would be slow, as nature's changes are, but the results are not the less certain. Beautiful diet, beautiful form. All pure poets have abstained almost entirely from animal food. Especially does a minister take less meat when he has to write a sermon. The less meat the better sermon. Every animal feeder is sometimes a tyrant. If one would abate that fate, he must omit it entirely, but by a gradual process. Compare a table of the present day with that spread by the hands of Eve, in Paradise, to feed her ethereal guests. Then was gathered together a feast of the purest—a banquet of right. Scholars, if they would get their lessons, can do so in a great deal shorter time and know more by adopting a pure diet. The cause of ill-temper and want of harmony in women, and peevishness of infants, and difficulties in family and other relations might be easily intimated. We are composed of atoms, and every atom must be musical and tremulous with harmony to give the body that harmony that is musical. The consent of our atome, the absolute consent of every atom to every other atom—that is harmony. Every passion leaves its impress, we know not how long. Every atom sympathizes with every other atom.—*From one of Bronson Alcott's Conversations.*

How to Kill the Blues.—Generally speaking, if you are troubled with "the blues," and cannot tell why, you may be certain that it springs from physical weakness. Instead of lying on a sofa and courting painful ideas if you are a despondent lover, a hypochondriac or a valetudinarian, you should be up and stirring yourself. The blood of a melancholy man is thick and slow, creeping sluggishly through his veins, like muddy water in a canal; the blood of your merry, chirping philosopher is clear and quick, brisk as a newly-broached champagne. Try, therefore, to set your blood in motion. To affect this don't go to guzzling down brandy-smashes, gin-cocktails, or any of the other guzzling compounds in which alcohol is disguised, for every artificial stimulant will drag you down two degrees for every one it lifts you up. The devil always heats you at a harter. Try, rather, what a smart walk will do for you; set your legs in motion on rough, rocky ground, or hurry them up a steep, cragged hill; build stone walls, swing an ax over a pile of hickory, or spade up a square rod of your garden.

A Horse with the Small-Pox.—A horse in St. Louis is recovering from small-pox. The horse was taken sick a month ago, and in a short time large boils made their appearance all over his body, and the hair fell out, until the animal looked as bare of hirsute adornment as Barnum's famous hairless horse. The formation of the scars and their development were identical with the development of small-pox cases. The animal suffered a great deal, and is now only convalescent, the postules passing out of the flesh and the hair beginning to sprout.

What to Eat.

Some Useful Hints from an Experienced Physician.

Two good hearty meals in the day are sufficient for health—one before going to work and the other after work is over; that is, breakfast and supper, or what is the same, late dinner. Some lunch is needed between these meals, but this should be light. A heavy meal in the middle of the day may suit children, but if hard work has to be resumed, it interferes with the work, and the work with digestion. Hot, heavy suppers taken shortly before going to bed prevent refreshing sleep, and are among the most frequent causes of attacks of indigestion; at the same time an empty stomach is to be avoided; a few biscuits, or something equally light, is all that is required.

Variety of diet is of importance to health; the stomach gets weary of a repetition of the same every day. Hurry at meals is to be avoided—eat slowly and chew well. Bodily toil and manual labor can be best supported by a vegetable diet, as bread, porridge, etc., with the addition of milk, eggs, butter and cheese; meat is much inferior to these as a supplier of strength. But it is very different with mental labor; here mixed diet, with animal food in moderation, is best. Fermenting drinks will always have a place among articles of diet, though health can be maintained best without them. The most wholesome are those which contain the least amount of alcohol, such as good, sound beer or claret. These, when taken moderately with meals, aid a weak digestion.

The practice of drinking stimulants as aids to work is a serious mistake; it checks the desire for wholesome food, leads to excess, and, sooner or later, injures the health. Tobacco should not be smoked just immediately before or after meals, as it weakens digestion. Too much smoking is a harmful habit, causing nervousness, shaky hands, palpitation of the heart, want of appetite and sleeplessness; when any of these occur, tobacco should be left off, or used very seldom. The practice of boys learning to smoke cannot be too strongly condemned. They think it manly, while they are really injuring their health and growth, so preventing themselves from becoming manly. Excessive tea-drinking is an evil not unusual among working women, producing ill-nourished mothers and weakly babes. Tea should not be taken more than once or twice a day, and should never take the place of a substantial meal. Health depends greatly on good cooking; the object of cooking is to render food digestible and attractive, and to give, at the same time, the greatest amount of nourishment with the least amount of waste. Every opportunity of learning and improving in this art should be eagerly seized.

Diet for Night Workers.—For night workers the best dietic plan includes a hearty breakfast when they rise, which is generally from 12 to 3 o'clock; some out-door exercise and relaxation should precede a good dinner, partaken between 6 and 9 o'clock at night, before beginning work. If the work is to continue until 4 or 5 o'clock in the morning, a light but nutritious repast should be eaten shortly after midnight, in order to fortify the system for labor during the hours immediately following, when the vital powers are most enfeebled. When the work is done, and before retiring, a very simple lunch should be taken in the form of good hot broth or beef tea, or a glass of light wine and a couple of crackers. This will generally insure sleep by withdrawing the blood from the brain, where it has been concentrated by mental effort. In ordinary cases of sleeplessness, not confirmed by long-continued habit, a light meal of this kind will generally prove a remedy. The substitution of phosphatic or so-called brain and nerve foods for a well-chosen regular diet is much to be reprobated; however excellent these preparations may be as adjuncts, a man might as well expect to work indefinitely upon the stimulation of alcohol as to live upon them without the necessary supplement of ordinary nutritious diet. By attention to these details, and by securing sufficient sleep, night workers can preserve their health under ordinary circumstances.—*Juliet Corson, in New York Times.*

A Preventive of Neuralgia.—A new invention as a preventive of neuralgia or rheumatism is a pine-wool vest which fits the body closely. In addition to their being made of this fabric, whose healing properties are well known, they are lined with chamois leather, which is perforated, so as not to check or retard the natural action of the skin.

London Railroads.—London contains 14 strictly terminal railway stations, from which no fewer than 2,202 trains depart daily, and nearly 1,600 of these leave between the hours of 10 A. M. and 10 P. M. The largest number of departures from a single terminus is 320, after which come two stations with 312 and 295 respectively. These figures are exclusive of the immense system supplying the city with local transit.

Stains of Oil Paint may be removed with bi-sulphide of carbon; many by means of spirits of turpentine; if dry and old, with chloroform. For these last, as well as for tar spots, the best way is to cover them with olive oil or butter. When the paint is softened the whole may be removed by treatment, first, with spirits of turpentine and then with benzine.

Passing Events.

The vigorous rain storms of the past week give indications of a prosperous year, a subject on which there were beginning to be some doubts. An abundant snow-fall in the mountains insures a good season's run in the spring, and the reservoirs and ditches will be full.

The cold weather, with its attendant snow and ice, has of late retarded mining operations in the mountainous districts. This is, however, only temporary.

It is worthy of note that already prospectors from Colorado are beginning to make their appearance in the Wood River region. This is the advance guard of a great army of prospectors which is expected to overrun that part of the country in the spring. This is very early for men to begin going to such a place, but it shows how eagerly new and favorable prospecting grounds are sought for.

The launch of the largest steamer ever built on this coast is an event to be noted, and the Dickie Brothers and the Risdon Iron Works are to be congratulated on the success of their work.

This number of the PRESS contains a great deal of interesting matter for the miner and metallurgist.

People who do not take the PRESS cannot keep abreast of the times with regard to mining machinery.

THE Modoc *Independent* mentions the fact of the existence of good stone coal in that county. Specimens taken from the surface burn readily in a blacksmith forge and can be used in all ordinary blacksmith work.

Magnetism of Minerals.

This physical property is not much used in determining unknown minerals, but it is of great importance in practical mineralogy and geology, since the instruments used in surveying are often affected by magnetic substances. The mineral which has most magnetic power is that called magnetite, or native loadstone. It sometimes occurs in large masses and very frequently in minute grains, disseminated through rocks so as to render them magnetic throughout. In this country and in Sweden a magnetic needle mounted so as to move in a vertical plane and called a "dipping needle," has been used in the discovery and mapping of masses of magnetic iron ore which are covered with other rocks.

This is the only important or widely-distributed mineral which will attract unmagnetized metallic iron, but many minerals are attracted more or less by a magnet, or will attract a magnetized needle such as is used for surveying instruments. The ores of manganese, nickel and cobalt often have this property in a small degree, as well as many ores of iron. Some mineral substances not naturally magnetic, become so after being heated, especially the carbonate of iron, which may thus be distinguished from several minerals which it much resembles with great ease and certainty.

A convenient instrument for a mineralogist is a pocket knife, one blade of which is magnetized. Such a knife may be used in testing fine particles of powdered minerals for magnetism.

Ordinary magnetic substances, as iron, nickel, cobalt, manganese and their ores, are generally attracted by either pole of a magnet; but magnetite has sometimes distinct magnetic polarity—that is, a particular point will *attract* one end of a freely-suspended needle while it *repels* the other end; native bismuth and some few other substances repel both ends of such a needle. These are said to be diamagnetic.

Production of Quicksilver in California.

We append a table, furnished us by Mr. J. B. Randol, showing the production of the mines of California for the year. This not only gives the sources of production, but the price, total production, etc. The famous New Almaden mine, of course, leads as usual.

PRODUCTION AND PRICE OF QUICKSILVER, FOR THE YEAR 1881.

Compiled by J. B. RANDOL, Manager New Almaden mines.

Production in California during 1881, 60,851 Flasks, each of 76.50 lbs, avoirdupois.
Production in Spain during 1881, 747,571,600 Kilos—50,353 Flasks, each of 76.07 lbs, avoirdupois.

THE mineral belt north of Lake Superior, Michigan, produced last year a value of $10,000,000 in copper and $18,000,000 in iron, and since the opening of these deposits they have yielded a value of over $300,000,000 in ingot copper, pig iron, and iron ores. The Calumet and Hecla mining company has disbursed in dividends since its organization $22,000,000.

Quartz Mining in the Vicinity of Auburn.

During the year 1881 the quartz mining interest around Auburn and Ophir in Placer county has been about stationary. Some mines which, during the preceding year, produced considerable gold, were not worked, and in several others but little milling rock was taken out. In place of these a number of old and abandoned mines were prospected and reopened. The bullion yield from the best sources of information was about $75,000, rather less than the yield of 1880.

The causes of the stationary condition referred to are two-fold: First, lack of outside assistance in the shape of capital. Second, lack of enterprise, capital or knowledge of the best means of development on the part of the present owners. Capital for several years past has been shy of investing in the Auburn quartz ledges. It is quite generally asserted and believed among mining men and investors that these ledges are very pockety in the distribution of the metal they carry, and lack permanence with depth. Of many of the mines the first statement is undoubtedly true, but the second yet remains to be proven with regard to many of them.

The quartz veins of this district differ materially among themselves, within certain class limits, in nearly all important characteristics. Their general course is approximately east and west, the greater number trending north of, rather than south of east. Cross veins occur at all angles and are not uncommon in certain parts of the district. The general dip is to the south and southeast. In thickness they vary between extremes of 8 and 10 ft. on one side down to one and two inches on the other, the average being about 2½ ft. Two country rocks occur, metamorphic slate in the northern half of the district, and granite in the southern, the line of junction of the two formations running nearly east and west.

Three general classes may be made of the quartz veins, two of which are found in the slate formations and the other in the granite.

Of the two classes in walls of slate, the lesser in importance, but the most peculiar in characteristics, are what are known among miners as reef-iron ledges. They have no general direction or course, but run irregularly, crossing each other at all angles. As a rule, they are quite narrow, ranging from a few inches to two ft. Running at right angles to the strike of the country rock (slate), are belts or bands of slate highly impregnated with iron pyrites, which, wherever reached by the atmospheric water, is oxidized, and presents all the appearance of an iron ore. From these iron deposits the quartz ledges which are crossed by them are known as *reef-iron* ledges. The pay chimneys or chutes of ore, though perhaps better termed a series of pockets, are found in the ledge pitching to the west, either adjacent to or in that part where intersected by the iron reef, the rest of the ledge being worthless. Those ledges which have paid the best are found to have very irregular walls, the vein pinching and splitting into stringers wherever the iron is encountered. The yield of gold from some of these pockets is very large—they run in value from a few hundred to several thousand dollars. The valuable rock is hand-sorted, the richest crushed in mortars, and the rest worked in some custom mill. This kind of quartz mining is of necessity very uncertain in its returns, and as the amount of pay ore is comparatively small, and the ledges liable to pinch out and disappear as depth is attained, but little fixed capital is employed. It is, however, followed by small companies of working miners, to whom it recommends itself by possibilities of large returns on a comparatively small outlay, with a fair measure of success. In the aggregate a large amount of this kind of mining has been done, and has yielded a large amount of gold. The Friday, Eckley, Almatah and Iron Point are at present the most important of the mines. Very little work has been done on any of them during the past year.

The other and more important quartz ledges found in the slate have been mined much more systematically, and in some instances have proven very rich. The greater number are of the eastern end of the district, the distinctively *reef-iron* ledges being west of and between them and the granite formation. These ledges all have about the same general direction—a little north of east. On Duncan hill and in its vicinity, they are best developed, seven distinct parallel ledges averaging 30 inches in thickness being traced by croppings from 500 or 600 to several thousand ft. The presence of iron pyrite or iron oxide in the ledge walls seems to have much the same effect as in the *reef-iron* ledges, as regards the position of the ore chimneys, the difference most marked being that those ore chutes pitch to the east instead of the west. Also, instead of the quartz being barren and worthless, with the exception of a few extremely rich specimen pockets, comparatively large chutes of milling rock occur, and in these chutes, occasional rich pockets yielding from a few hundred to several thousand dollars. The ore is free milling and the gold usually quite coarse, many of the pockets being quartz rich enough for jewelers' use.

Among the most important of the mines located on these ledges are the Shurtleff, Conrad, Thorp, Hunter, Booth, Crandall and Mina Rika. Of these, the Booth and Crandall had only a little prospecting and assessment work done for several years. The Shurtleff and Conrad mines have had tunnels run to reach greater depths, and other improvements made; but little ore being taken out and milled during the year. The Hunter and Thorp mines have yielded some ore, but the main producing mine has been the Mina Rika. This latter, when the others during 1880 were yielding large amounts of ore milling from $30 to $200 per ton, was an abandoned mine. Relocated and prospected anew, a considerable body of high-grade ore was discovered. The mine, then sold to an Eastern company, has been yielding excellently for several months past, having, it is claimed, nearly paid for itself in that time.

Bellevue mine, on the west end of the mines in the slate belt, and about one-half mile north of Crater hill, is close on the line of junction between the two country rock formations. Several years since, it ranked as one of the best mines in the district. The vein was not very wide, but the ore was of high grade, free-milling $50 and upward per ton. Considerable of this rock was taken out and milled, but at a depth of about 200 ft. the ledge was lost. The mine was finally sold under execution, and after lying idle for some years, a portion was purchased by a couple of Cornish miners who had worked in the mine. They recovered the ledge at a depth of 80 or 90 ft., where it had worked off into the wall as a small stringer, and have since been taking out from a ledge 4 to 10 inches wide, rock milling $90 and $100 per ton. The sulphurets of which the rock contains a large percentage, are also extremely rich.

The quartz ledges that are found in the granite formation, are more numerous, larger, richer, more permanent, and have been worked more extensively than the ledges just described. Though some of the quartz deposits occurring in the slate are undoubtedly true fissure veins, the evidences that they are such are not near as conclusive as in the case of many of the ledges in the granite. The walls of many of the latter are smooth and striated; a gouge is usually present, and the ledges much stronger and better developed at the greater depths to which exploration has been carried. Their general course is east and west, or northeast and southwest. The greater number are concentrated around and on what is known as Crater hill. The entire surface ground in this vicinity has been washed and rewashed, yielding large amounts of placer gold, all of which, beyond doubt, came from these ledges.

(TO BE CONTINUED.)

A New Steamship.

The launch of the steamship *Mexico* from the Dickie Brothers' ship yard, this week, is a very noteworthy event, as she is the largest vessel ever built in this city. She is 285 ft. long, 36 ft. beam, 29 ft. 6 in. deep in the hold, and being 1800 tonnage. She is constructed throughout of Oregon pine, with ceilings edge-bolted with 1¼ inch square iron bolts. She is supplied with berths for 75 cabin passengers, and accommodations for 60 passengers in the steerage, all the arrangements being designed specially to afford ventilation and convenience. The cabins and saloons are yet to be furnished.

The vessel is supplied with compound engines, specially designed and built in this city, at the Risdon Iron Works. The cylinders are respectively 30 and 60 inches in diameter, and stroke 54 inches. The propeller shaft is 12 inches in diameter, bedded in heavy plates, on which the whole engine stands, coupling with connecting rods. With 80 lbs. of steam the engine will make from 60 to 65 revolutions per minute, and drive the vessel at the rate of 12 knots an hour. The shafting is 100 ft, long. The propeller is made of composite metal, is 13 ft. in diameter, and weighs six tons.

The engines are supplied with steam from two double-ended boilers, provided with two furnaces at each end. These boilers are 11 ft. in diameter and 17 ft long. There are also two super-heaters 6 ft. 8 inches in diameter and 6 ft. in length. A casing of iron has been built around the boiler room 36 ft. in length, 12 ft. across, and 18 inches above the awning deck, which gives perfect security against fire. The weight of the machinery is 250 tons. There is also a donkey engine for running anchor windlass and hoist, which is supplied with steam from main or donkey boilers. There are also four donkey pumps on board for fire and water purposes, and a centrifugal pump for the condenser. The entire machinery is fitted with the latest and newest improvements.

The *Mexico* will have cost the company, when ready for sea, something over a quarter of a million dollars.

GATHERING COURAGE.—The Wood River *News* says it is pleasing to see how prospectors and miners in the ore belt from Bellevue to Bullion are striking with tunnels and shafts to attain depth. It was not so until late last fall. They were afraid to dig deep, but Col. Wall, H. E. Miller and a few others have struck deep and won, and the spirit to be brave is now evinced in hundreds of instances. They are right. Depth attained brings up richer ores and there is no diminution in width of vein to our knowledge.

MECHANICS' INSTITUTE ELECTION.—At the annual election of Trustees of the Mechanics' Institute this week, the following were chosen: P. B. Cornwall, J. A. Bauer, D. A. Macdonald, David Kerr, J. R. Wilcox, G. H. Hoppa and Edwin Tretwell.

Notes on Mica.

[Written for the PRESS by HENRY G. HANKS, State Mineralogist.]

Inquiries have been so frequently made at the State Mining Bureau concerning the uses and value of mica, and so many worthless samples sent for examination, that it has been thought best to publish such facts as will afford the information so often asked.

The uses of mica are few; but as there is nothing to supply its place, and as it is seldom found in large sheets or in large quantities, it will always command a good price, which will depend upon the supply; and as the demand is steadily increasing, there is no likelihood of the market being overstocked. The chances for discovering good merchantable mica in California are better than in most countries, for the reason that the field is new, and that multitudes of educated prospectors are looking for any mineral that can be turned to account. It is to give them all information on the subject that this paper is written, in the hope that a valuable deposit may be found in the State, and to prevent them from wasting their time and incurring unnecessary expense in attempting to develop worthless material.

The writer of the following letter applied to the Mining Bureau for information as to any workable deposits of mica in the State, and gave in return information as to its value in Europe, which he was asked to put in writing for the benefit of those interested.

Copy.

H. G. Hanks, Esq., State Mineralogist—DEAR SIR: During a recent journey through Germany I called on Mr. Max Raphael at Breslau (Prussia), a manufacturer of mica articles, who commissioned me to obtain for him good merchantable mica, of which he is willing to purchase any quantity, and which, he thought, may be found in California and other States of the Pacific coast.

To enable me to judge of the quality needed by him, he gave me some types of such mica as he is using in his factory. It comes mostly from East India, shipped via. Calcutta to England. When finally split, the red-brownish tint is scarcely visible. Mica from the Pacific coast has a greenish tint, and is inferior to the East India, yet Mr. R. says it is suitable for his purposes. Herewith I beg leave to hand you some of these types, viz.: Nos. 1, 2, 3 and 4. These are considered to represent merchantable mica. No. 3 is of extra fair quality, though it would scarcely yield plates larger than 3x5 inches, the balance being streaked and worthless. Nos. 5, 6, 7, 8, 9 and 9a are samples of worthless mica.

Nos. 11, 12 and 13 are plates such as are obtained from good mica, as shown by Nos. 1 to 4.

The value depends entirely upon the square or oblong size which it will yield when split. Sizes less than 2½x5 inches are valueless, for these are abundantly obtained in working up large pieces.

A fair quality of mica, yielding 3x5 inches, is worth about 50 cents per pound; 3½x5, 50 cents; 3x6, 62 cents; 4x6, $1; 5x9, $1.25; 7x7, $1 62; 8x8, $1.75; 9x9, $2.25; 10x10, $2.50; 12x12, $3.

These prices demonstrate that the mining of mica can be made very remunerative. Surface mica is always of inferior quality; in going downward the strata become well-defined, less disturbed, denser and purer. Good mica must be free from flaws and foreign substances, must split readily and be clear and transparent.

Were such mica obtainable in California or the Pacific States, it would be to the interest of the parties mining it to send fair samples to your Bureau. Such samples should not consist of a thin layer split off, or insignificant pieces of the mineral, but be fair specimens of the mine or ledge, taken some 5 or 10 ft. below the surface or croppings. These specimens, from one-quarter to one and one-quarter inches in thickness, need not be trimmed square, but may be pieces in their irregular shape, though freed from adhering rock or ledge matter.

Only when large quantities are to be shipped it is best to trim the pieces oblong in order to save expense.

The party previously named authorized me to contract for the permanent delivery of large quantities. For the convenience of mine owners the mica might be delivered at the mine, or the nearest railway station.

Very respectfully and truly yours,
(Signed) HENRY JACOBY,
439 California Street.
San Francisco, Jan. 30, 1882.

The word mica is used at the present time to designate a group of minerals of different chemical composition rather than a single species. They were all included under the designation until 1792, when lepidolite was found to be a separate species, and given a specific name, which it still bears. The minerals of the mica group, however, have certain physical properties in common, among which is the characteristic one of cleavage parallel to the basal plane of the crystal. What is generally known as mica, and seen only in very thin laminæ, is in reality only a small portion of the crystal. A perfect crystal of mica is seldom found in nature. This fact results from the facility with which the thin laminæ separate in the plane of natural cleavage. To realize what a mica crystal is like, imagine a multitude of thin cards cut into hexagonal or rhombic forms and piled upon each other, commencing at the base with the smallest, increasing gradually to the center, and diminishing again to the top of the mimic crystal.

Large sheets of mica have been found in Norway and Sweden. In the United States, mica in sheets sufficiently large to have a commercial value has been found at Alstead, Grafton and Acksworth, New Hampshire, at Mt. Mica, Maine, and in Canada. In 1867, mica mines that had been anciently worked, were rediscovered in Mitchell county, North Carolina.

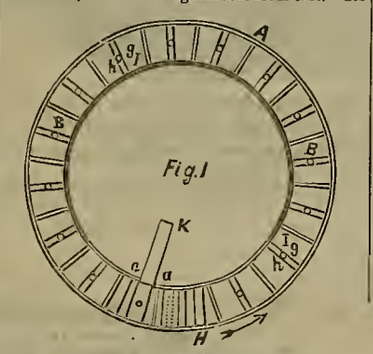
The large sheets of mica brought to the European market are principally from Siberia. The mineral is known in commerce as isinglass—*glaces mariæ*—and sometimes Muscovy glass, because it was first found in quantities in that part of Russia formerly called Muscovy.

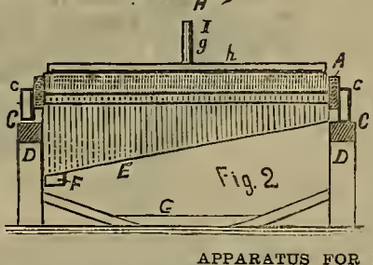
Pliny confuses several minerals under the name of "speculer stone." Probably mica and selenite are alluded to, in writing of the *lapis specularis*; and it is doubtful which was used "in shavings or scales to sprinkle in the Circus Maximus at the celebration of the games, for the purpose of producing an agreeable whiteness;" but Dana thinks it may have been a silvery mica schist.

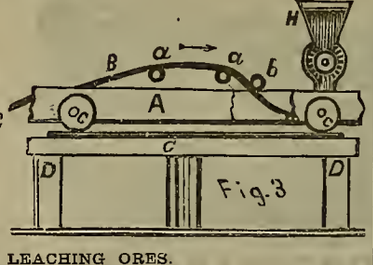
Silvery and golden-colored mica were called "cat silver" and "cat gold" in the middle ages.

Richard Kirwan, in his Elements of Mineralogy, published in 1774, thus describes "pure mica:"

"This stone in its purest state is colorless, but, either from a less intimate combination, or from a mixture of some superfluous ingredient, principally iron, it is found of different colors, white, red, yellow, green, brown, or black. The white and yellow sort have a splendid metallic appearance—smooth but not greasy to the touch, which distinguishes it from talc. Its







APPARATUS FOR LEACHING ORES.

texture is always lamellar or scaly, and the lamellæ or scales are slightly flexible and often elastic. These scales are sometimes parallel to each other, sometimes interwoven, sometimes wavy or undulated, and sometimes they represent filaments. Its specific gravity is from 2.535 to 3.000 when loaded with iron. It does not effervesce with acids and is insoluble in them, without particular management, but, after it has been calcined with four times its weight of fixed alkali, it effervesces strongly, and is in a great measure soluble. The pure, colorless mica is infusible *per se*, and scarcely melts even with mineral alkali, but yields more readily to borax or microcosmic salt, with scarce any effervescence, but the colored sorts were found by Mr. Saussure to be soluble *per se*, though with difficulty, for they require a stronger heat than ehoerl does.

One hundred parts of the colorless kind contain 38 of silex, 28 of argill, 20 of magnesia and 14 of the most dephlogisticated calx of iron. Martial mica contains besides 10% or 12% of a more phlogisticated calx of iron, from which its various colors are derived, and a proportionately smaller quantity of the other ingredients."

Mica can be distinguished from other minerals by the following tests: It must have the property of splitting into thin laminæ which, by careful manipulation, may be again and again divided into thinner sheets. The scales, no matter how thin they may be, must be tough and elastic, in the which they differ from selenite and jeffersite, which are often mistaken for mica. The thin films must be transparent even if the larger masses were dark-colored and apparently opaque. The surface of the films must be smooth and highly polished, and must remain unchanged when heated to redness in the flame of a spirit lamp or similar source of heat. Mica is easily scratched by a knife, and sometimes with the finger-nail. According to Hauy, laminæ of mica may be obtained by division so thin that it would require 250,000 to make an inch in thickness. Mica is never found in very large masses, nor in beds or deposits, yet it is one of the most abundant of all the minerals which form the earth's crust. Slabs of mica have been found in Russia two and a half yards square. In Siberia large masses occur in granite and are specially mined. Mica is one of the constituents of many of the rocks, as granite, gneiss mica, schist mica, slate, etc. The largest plates occur in veins of granite. It occurs accidentally in seyenite, euphotide, hypersthenite, diorite, trachyte and basalt.

Mica sometimes forms artificially in furnaces in which copper and other metals are melted, and the walls of such furnaces in which sandstones are used for lining sometimes become coated with a fine pearly mica, which probably derives its potash from the ashes of the wood used for fuel. An analysis of such a formation gave to Mitscherlich the following result:

Silica	47.31
Alumina	5.74
Peroxide of Iron	28.91
Peroxide of Manganese	10.48
Magnesia	10.17
Potash	1.05
Lime	6 23
	99.89

In crossing certain streams or rivers flowing in shallow sandy beds, quartz sand may be seen to roll forward beneath the water, remaining near the bottom, but particles of mica, frequently of a golden color, rise with the force of the stream to the surface and glitter and gleam in the sunlight like particles of gold, for which they have often been mistaken. This peculiarity of mica was frequently noticed in the Platt river by the early emigrants to California, and by those who had discovered the mistake it was called "*Fools' Gold.*"

There is a specimen of yellow mica schist (No. 1626) in the museum of the State Mining Bureau from a large deposit, which caused the Gold Lake excitement, and it is so like the precious metal in appearance that it is not surprising the mistake should have been made. With the advancement of invention there has been created an increased demand for mica, which has raised the price to that extent that a deposit of the best quality would be very valuable to the finder.

(TO BE CONTINUED.)

Chloro-Bromide of Lead.

In the treatment of Leadville carbonate ores by the blast furnace, Mr. Malvern W. Iles noticed a number of very curious and interesting compounds. A compound having the formula Pb (Br Cl) was discovered, occurring as a furnace product, in small (2½ inch) circular openings in the cast-iron supporting plate, 11½ inches above the water-jacket. The iron ring rests upon four cast-iron columns, and supports the sheet-iron fire-brick lined structure above. This ring plate is perforated by holes, which serve to prevent a total rupture of the plate by the expension caused by the internal heat. The course of fire-brick at the bosh es close these holes from below, while the interior fire-brick lining covers these circular openings, thus forming a small condensation chamber, in which the chloro-bromide of lead was found. In order to see whether this compound was contaminated with any silver salt, it was assayed, one-tenth assay ton yielding by cupellation only a most minute trace. Hence it is to be concluded that this was simply an accidental occurrence of a small amount of ore, or a trace of a volatile silver salt. It was noticed that the white fumes which condensed upon surrounding cool objects yielded 3½ ounces of silver per ton; hence it is not improbable that there is some volatile compound of silver not clearly identified, and which mingles slightly with the chloro-bromide of lead. The furnace crystals occurred in several forms—as, for example, in pure white, delicate plates, not unlike crystals of lead chloride; in long needles; in semi-fused, distorted needles, having a slightly yellowish tint; and also in entirely fused masses. The crystals dissolve in warm water, forming a milky-white turbidity, which readily clears up on the addition of a few drops of nitric acid. The aqueous solution deposits plate-like crystals, and from the moderately dilute solution, by slow crystallization, one may obtain doubly terminated acicular needles, considerably thickened in the central portion. The body sublimes on charcoal, giving a white coating. In a closed tube it melts readily to a bright red color; upon cooling it lightens up, changing from a lemon yellow to a pure white; on increasing the heat it sublimes in heavy oily drops. Density, 5.741. This product is found to be very stable, and is decomposed by boiling concentrated sulphuric acid only by repeated applications, and the complete transformation into a sulphate is difficult.

Ore Leacher.

Messrs. Shalder & Russel, of West Jordan, Utah, have invented an apparatus for leaching ores on a large scale. The invention consists of a circular frame supporting the filter and moving on a circular track above an inclined circular table. There are three stationary rollers, designed to elevate and depress the filter at certain points as it revolves. There is also a device for feeding the substance to be leached upon the filter; one for applying the leaching solvent, and a precipitating tank to contain the solution passing through the filter.

Fig. 1 of the engravings is a plan of the circular revolving frame or filter. Fig. 2 is a transverse sectional elevation of the revolving frame, filter, circular table, and device for applying the leaching solvent. Fig. 3 is an elevation, partly in section, showing the revolving frame, circular track and table, filter, adjusting rollers and feed apparatus.

In the drawings *A* represents the circular frame, carrying between its sides a filter, *B*, of canvas, matting or other suitable material. Extending transversely under the filter, *B*, from the point at which the ore or other substance is discharged, are the two stationary rollers, *a a*, which serve to raise the filter at that point. Just beyond these rollers, *a a*, as the frame, *A*, and filter, *B*, move in the direction of the arrow is a third stationary roller, *b*, set lower than the rollers, *a a*, so that the filter, *B*, shall pass under it. This frame, *A*, is set in wheels or rollers, *c*, that rest on a track, *C*, which track is supported on a framework, *D*, of the device. Beneath the filter is a circular inclined table, *E*, around the inner and lower edge of which is a trough, *F*, below which is the precipitating tank, *G*.

H is the feeding device to feed the ore. *I* is the device for supplying the leaching solvent, which device consists of a rubber tube, *g*, connected at right angles with a tube, *h*, that is filled with perforations on its under side, so that the leaching solvent, in passing through said tubes, shall be sprinkled, in a finely comminuted condition, upon the ore or other substance on the filter, *B*.

K represents a conductor for directing water upon the filter at a point immediately over the rollers, *a a*, in order to wash off leached ore or other substance.

In operating this device the comminuted ore or other substance is delivered by the feed apparatus, *H*, upon the filter, *B*, directly in front of the roller, *b*, so that as the filter, *B*, revolves, the said ore or other substance shall, from this point until it reaches the rollers, *a a*, be exposed to the action of the leaching solvent, which is discharged upon it from the pipes or tubes, *g h*, the leaching solvent at the same time dissolving the precious metal or other substance contained in the ore, and, filtering through the filter, *B*, falls upon the inclined table, *E*, thence, into the trough, *F*, which conducts it to the precipitating tank, *G*, for treatment.

As the said frame, *A*, and filter, *B*, continue to revolve, the filter, *B*, passes over the rollers, *a a*, at which point the ore or other substance upon the filter is found to be deprived of its soluble metal or other substance, and at this point, above the rollers, *a a*, water is discharged through the pipe, *K*, upon the filter, *B*, to wash off the exhausted ore or other substance. The filter, *B*, then passes down beneath the roller, *B*, and receives a fresh supply of material from the feed apparatus, *H*, to be operated on.

The inventors say it has been found in practice that a filter four feet wide, the circle of which has a diameter of 40 ft., will leech 50 tons of ore in 24 hours, and that the apparatus can be applied wherever leaching tanks are now used.

Coal on the Pacific Coast.

The following table copied from the census gives the production of bituminous coal, etc., west of the 100th meridian:

NAME OF STATE.	No. of mines.	Horse-power of engines.	Value of all machinery.	Total capital employed & invested.	Acres of coal land.
California	478	295	377 500	$1,239 431	2 900
Colorado	1,133	749	100,650	5,939 250	23,529
Montana Ter.	3	.....	.....	12 550	.....
Oregon	52	60	13,000	226.523	2 640
Washington Ter.	103	115	15,500	345.421	2,600
Wyoming Ter.	830	2 8	59,000	726.398	1,200
Total	2,599	1,447	$265,650	$8,479,573	32,938

THE LICK TELESCOPE.—The work of Messrs. Alvan Clark & Son on the lenses for the Lick telescope has not yet commenced. The glasses have not yet even been cast. That work is to be done by a famous firm of Paris. The Messrs. Clark are just now busily engaged, night and day, upon the lenses for a great Russian telescope. They have just finished a superior telescope for the New Bedford high school. It required six months of various castings to obtain proper glasses for the Russian telescope. One of the glasses had an imperfection in it, and in order to utilize it, the glass will be a trifle thinner than originally contemplated, thus requiring a larger focus. The rough glasses for the Lick instrument are expected six months hence.

CHICAGO **FRASER & CHALMERS,** ILLINOIS.

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LAROEST and BEST APPOINTED SHOPS in the West. We are prepared to huild from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores hy wet or dry crushiog. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kilo Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, ohlong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engioes, from 6x10 to 18x60. This latter size furnished J. B. Haggin for Giant and Old Abe Co, Black Hills also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushiog Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columhus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylioders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pinc Iron Works C. H. No. 1 Flaoge Iron, or Otis Steel. Workmansbip the most careful. All Rivets Hand Driven.

McCaskell's Patent Car Wheels and Axles—Best in Use.

New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will hreak more rock, is stronger, safer and better than any other Explosive in nse, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding homhastic and pretentious claims hy others.

It derives its name from HERCULES, the most famous hero of Oreek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to hase.

No. 1 XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street - - San Francisco, Cal.

The best of

Through Dewey & Co.'s Scientific Press Patent Agency.

No. 252 Market Street. Elevator, 12 Front St., S. F. Telephone No 658.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, hy reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in onr own commnnity, and our most extensive law and reference library containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented throngh our Agency will have the henefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent bnsiness, and ohtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issned to inventors on the Pacific Coast have heen ohtained throngh our Agency. We can give the hest and most *reliable* advice as to the patentahility of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacifio Coast inventors are far superior. Advice and Circnlars free. DEWEY & CO., PATENT AGENTS.

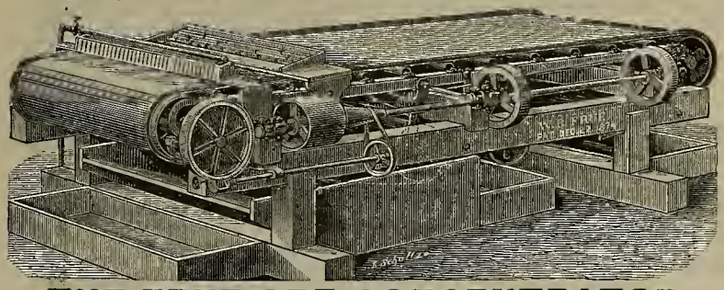
$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR.

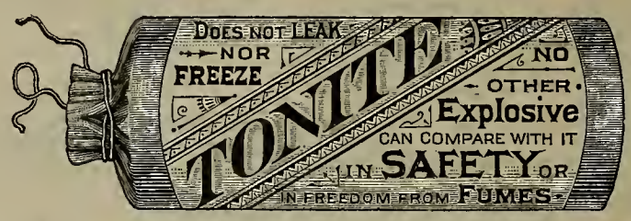
Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.

Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the lahor required is light, one man on a watch can attend to sixteen machines.

We challenge any other Concentrator in use for a fair and impartial competitive trial, side hy side, for stakes of $1,000 each, and we mean business.

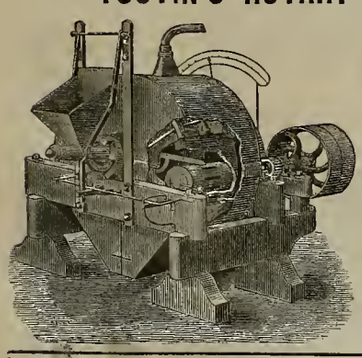
☞A machine with all improvements can be seen in working order and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont street.

ADAMS & CARTER, Agents, Room 7 No. 109 California Street, S. F.



TONITE POWDER COMPANY, - - 403 California St., S. F.

TUSTIN'S ROTARY PULVERIZING MILL.



WORKS ORE WET OR DRY,

And Feeds Itself Automatically.

Patented October 11, 1881.

One of these machines can he seen at the Ore Sampling and Pulverizing works of Hofmann Bros, No 415 Mission St., where it is working every day. Weight 5,000 lbs., heaviest piece 480 lbs.

Manufactured at the

TUSTIN WINDMILL, HORSE POWER AND PUMPING MACHINE WORKS.

308 Mission Street, S. F., Cal.,

By W. I. TUSTIN, Inventor and Pateotee.

ENGINE LATHES IN SECTIONS.

Limit of weight for 25-inch Lathes, 300 pounds, For 17-inch Lathes, 150 pounds.

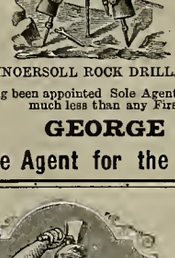
Standard and Special Machine Tools.

SAN FRANCISCO TOOL CO., No. 21 Stevenson St., San Francisco.

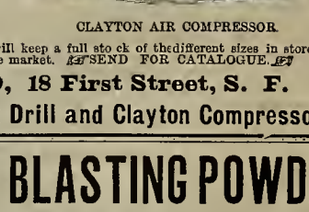
CLAYTON AIR COMPRESSORS,

—AND—

INGERSOLL ROCK DRILLS.



INGERSOLL ROCK DRILL.



CLAYTON AIR COMPRESSOR.

Having been appointed Sole Agent for this Compressor, I will keep a full stock of the different sizes in store. Prices much less than any First-class Compressor in the market. ☞SEND FOR CATALOGUE.☜

GEORGE R. FOARD, 18 First Street, S. F.

Sole Agent for the Ingersoll Rock Drill and Clayton Compressor Co.

VULCAN BLASTING POWDER.

—THE MOST ECONOMICAL AND BEST—

Nitro-Glycerine Explosive in the Market.

In the suit of the Giaot Powder Co. against the Vulcan Powder Co. for *alleged* infringement of Patent, it was held that the Giant Powder Patent was INVALID.

Nos. 1, 2 and 3 Vulcan,

Each grade superior to like numhers of any other Nitro-Glycerine Powder in the market.

VULCAN B. B.,

Superior to Black, Judson or any low grade Powder for Bank Blasts, Railroad work, or any work where Black Powder has been heretofore employed.

TRIPLE FORCE CAPS AND ALL GRADES OF FUSE.

The CONSUMER'S COMPANY sell the hest Powder at the lowest rates.

Office—218 California St., San Francisco.

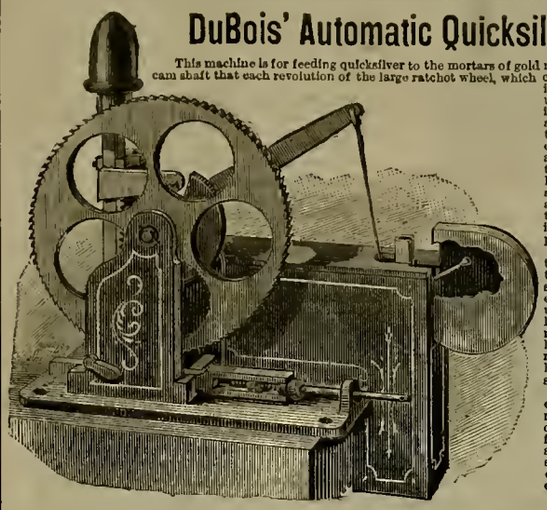
THE PATENT CHANNEL IRON WHEELBARROWS.
THE STRONGEST BARROW MADE. These Barrows are made by Superior Workmen, and of the best material. All sizes kept constantly on hand

SHEET IRON PIPE.
Lap-Welded Pipe, all Sizes, from Three to Six Inches. Artesian Well Pipe. Also, Galvanized Iron Boilers, from 25 to 100 Gallons.
Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools supplied for making Pipes. Estimates given when required. Are prepared for coating all size of Pipes with a composition of Coal Tar and Asphaltum.
Office and Manufactory, 130 Beale Street, San Francisco.

SHEET IRON PIPE.

DuBois' Automatic Quicksilver Feeder.



This machine is for feeding quicksilver to the mortars of gold mills. It is so connected to the cam shaft that each revolution of the large ratchet wheel, which can be regulated to revolve once in one, two, three or four minutes, as desired, dips a small cup into a reservoir of quicksilver, and by a trip of the cam, empties the contents into a pipe leading down to the mortar, supplying an exact quantity at regular intervals, superseding the ordinary hand feeding, which is of necessity subject to great irregularity, and liable to neglect. It renders the amalgamation of all the gold in the pulp equally certain and perfect.
The mechanism to produce this depression and elevation of the cup, is driven by the cam shaft, similarly to the self-feeders, over which so much ingenuity has been expended to regulate the delivery of ore to the mortar. As it is to be desired to have the ore go in constantly and regularly, so it is equally desirable to have the mercury fed constantly and regularly.
A chief point of excellence of this machine is, that it allows the quantity of mercury which would be otherwise fed in mass, in one hour, to be subdivided into a number of small portions, and fed almost continuously; *i. e.*, from every one to four minutes.
Price, complete, $100.

For Sale by **WHITNEY & MARSHALL,** Sole Agents
22 & 24 Fremont St., San Francisco.
Dealers in Iron, Steel, Hardware and Mining Supplies, Wrought Iron Pipe and Fittings, Pump Columns, Wire Rope, etc. A large stock of Boiler, Plate and Sheet Iron of every description.

MOREY & SPERRY,
MANUFACTURERS OF
Gold and Silver Grinding and Amalgamating Machinery

HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.
It weighs complete, 7,000 pounds. It costs $1,500 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.
Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores Chloridizing Furnaces, Retorts, Rock Drills Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies Iron Work complete for Wood Frames, also
SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.
☞Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.
MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

BODY BRACES.—Jas. W. Anderson, Bodie. No. 253,251. Dated Feb. 7, 1882. This invention relates to a brace for the body and shoulders, the principle of which is in providing a suitable means for pressing forward the small of the back, whereby the body is kept straight and the shoulders prevented from being thrown forward. The invention consists of supports properly connected and shaped to fit the abdomen, and a band or strap which passes from the front support around the waist, said strap having upon it a pad which fits the small of the back. The object of the invention is to straighten and support the body, and by this means to cause the shoulders to be kept back, because, having the lower part straight, it is inconvenient to throw the shoulders forward. The invention is therefore a body straightener and a shoulder brace.

ORNAMENTATION OF GROUNDS.—Henry D. Cogewell, S. F. This invention relates to the ornamentation of grounds, such as cemetery lots, gardens, lawns, public parks or open spaces of any description; and it consists in the formation of gutters or ornamental spaces of artificial stone, asphalt, terra-cotta ware, metal or other suitable material in sections which have uniting flanges and particular kinds of supports, by which they are kept level and in place. These gutters and grounds may have spaces or openings formed in them in the shape of birds, animals, astronomical or geometrical, or other ornamental figures, proportional to the space, through which grass or other vegetation is allowed to grow so as to form the device which is cut off.

SEEDERS AND CULTIVATORS.—John E. Henris, Dixon, Solano Co., Cal., No. 253,285. Dated Feb. 7, 1882. This invention relates to that class of agricultural implements known as seeders and cultivators, the object of which is to sow the seed and cover it up. It consists in an appropriate wagon carrying a hopper containing regulating and feeding plates, and opening out into spouts leading to receivers surmounting a rotary distributing disk. Upon the rear of the frame are independent arms carrying adjustable cultivators. Appropriate mechanism, receiving motion from the wheel, operates the various parts.

WATER-WHEEL.—Royal N. Davidson, Weaverville, Cal. Dated Feb. 7, 1882. No. 253,267. This invention relates to that class of water-wheels which are operated by the forcible discharge of a stream of water upon the buckets or flanges on the rim of the wheel, and are commonly known as turbines. The improvements consist in certain details of construction. This is a central discharge wheel. The force of the stream is directed against the buckets and against the conical side of the wheel. After expending its force it is conducted toward the center, and because of a peculiar conical side, is discharged out of line of the power stream, and thus does not interfere with it, nor do the contents of one bucket interfere with another.

LATHE ATTACHMENT.—Henry Richmann, S. F. Dated Feb. 7, 1882. No. 253,314. This invention relates to a novel attachment for lathes, which is adapted to cut the teeth of gear wheels, ratchet teeth, spiral grooves for twist drills, key seats or ways in shafts, bolt heads, nuts, and various kinds of irregular work which ordinarily requires special and complicated apparatus. It consists of a support which has a foot that may be clamped to the tool rest of the lathe. This support is slotted to receive a bolt which holds an adjustable standard, through which the spindle passes, which drives the various cutting tools that are secured to it. This spindle is driven by gearing, or pulley, or both. The belt from the pulley passes up over two pulleys which are vertically adjustable, to allow the tool to move longitudinally upon the lathe bed and thence down to the main pulley in the head block of the lathe, a counterbalance keeping up the tension.

PALMER SAFETY CLUTCH.—We have been shown a handsome working model of this device, which we recently illustrated. The model is complete in every particular, is made of metal, and silver plated. It shows a passenger elevator with the Palmer safety clutch, safety governor, etc. Also the device for stopping the elevator at any point, so arranged that the elevator boy can operate it. It looks impossible for an elevator to come to any accident with these appliances connected with it. The elevator in the Grand Hotel, that of the army headquarters, and several others are now supplied with this safety attachment.

ALL the stamps of the Homestake mining company are again in operation. A new and rich discovery of ore is reported on the 100 level directly under Lead City, but no ore is being removed.

Recent Contributions to the California State Mining Bureau.

[Furnished by HENRY G. HANKS, State Mineralogist.]

[CATALOGUE.]

Arenaceous Sandstone—Found in the bed of the river, near Yreka, Siskiyou county, Cal. Dr. F. G. Hearn.

Borings from James Phelan's Well—O'Farrell St., S. F. A, 185 ft. deep; B, 192; C, 200; D, 225; E, 240; F, 245; G, 251; H, 260; I, 265 ft. J. Z. Davis.

Silver Ore—Dundee mine, Globe district, Pinal county, Arizona. C. Fraser.

Actinolite—Twelve miles east of Gilroy, Santa Clara county, Cal. Wm. Brannan.

Silicified Wood—Chalk Bluffs, Nevada county. A large quantity and great variety of specimens. John Spaulding, superintendent of South Yuba M. & M. Co.

Gold in Porphyry—Banghart mine, 10 miles north of Shasta, Shasta county, Cal. W. Banghart.

Silver Ore—Large specimen; Phil Sheridan mine, Granite Creek mining district, Grant county, eastern Oregon. C. S. Miller. This specimen contains chalcosite or tetrahedrite; rich in silver and free gold. Assay value, $160 per ton. (See No. 3431.)

One Hundred Foreign Birds—J. Z. Davis.

Silver Ore—Unknown mine, Yankee Fork mining district, Salmon River mountains, Custer county, Idaho. Wm. B. Hyde.

Silver Ore—Custer mine, Yankee Fork mining district, Idaho. Wm. B. Hyde.

Crude Soda—Big Soda lake, Churchill county, Nev. John Flemming.

Sal Soda Made from Crude Soda—Big Soda lake, Churchill county, Nev. John Flemming.

Marble—From the cave at Cave City, Calaveras county, Cal.

Copper Ore—Eagle mine, Quail hill, Calaveras county, Cal. A. S. Church.

Bedrock—Malakoff mine, North Bloomfield, Nevada county, Cal.

Bedrock—Malakoff mine, North Bloomfield, Nevada county, Cal.

Bowlder—Polar Star mine, Dutch Flat, Placer county, Cal.

Cement with Gold—Chimney Rock, Green Valley claim, near Dutch Flat, Placer county, Cal. H. Boek.

Pipe Clay—Malakoff mine, North Bloomfield, Nevada county, Cal.

Calcite with Pyrite—Malakoff mine, North Bloomfield, Nevada county, Cal.

Bedrock—Malakoff mine, North Bloomfield, Nevada county, Cal.

Rock Used in Paving the Flumes—Milton hydraulic mine, Nevada county, Cal.

Bedrock—Gold Run, Placer county, Cal.

Quartzite—Malakoff mine, North Bloomfield, Nevada county, Cal.

Bedrock—Cherokee, Nevada county, Cal.

Bedrock at Flume—Milton mine, Nevada county, Cal.

Bedrock—American mine, near North San Juan, Nevada county, Cal.

Porphyry Bedrock—Malakoff mine, North Bloomfield, Nevada county, Cal.

Hard Cement with Gold—Malakoff mine, North Bloomfield, Nevada county, Cal.

Chalcedonic Bowlder—Polar Star mine, Dutch Flat, Placer county, Cal.

Rock Specimen—Bridge at Yuba river, below Blue Tent, Nevada county, Cal.

Geode of Calcite—Sweetwater, Nevada county, Cal.

Bedrock at Flume—Milton mine, Nevada county, Cal.

Bedrock of Manzanita Mine—Nevada City, Nevada county, Cal.

Bowlder—Malakoff mine, North Bloomfield, Nevada county, Cal.

Bedrock at End of Flume (Gneiss)—Milton mine, Nevada county, Cal.

Pyrite Found in Lignite (Large Tree)—Malakoff mine, North Bloomfield, Nevada county, Cal.

Copper Shale—Sweetland Creek mine, Nevada county, Cal.

Pyrolusite Found in Copper Shale—Sweetland Creek mine, Nevada county, Cal. (See No. 3412).

Bedrock—Malakoff mine, North Bloomfield, Nevada county, Cal.

Serpentine (?)—Bald Pararie, Placer county, Cal.

Jasper—Bald Pararie, Placer county, Cal. Chas. Purdy.

Gold Quartz—Phil Sheridan mine, Cranite mining district, Grant county, Oregon. C. S. Miller.

Porphyry Bowlder—Polar Star mine, Dutch Flat, Placer county, Cal.

Bowlder—Polar Star mine, Dutch Flat, Placer county, Cal.

Calcite—Polar Star mine, Dutch Flat, Placer county, Cal.

Gold Quartz—Murchie mine, Nevada county, Cal.

Jaspery Iron Ore—Northwest corner of Sonoma county, near Point Arena. L. L. Bullock.

Silicified Wood—Omega, Nevada county, Cal. Duncan McLaughlin.

Gold Quartz—Champion mine, Yuba river, near Omega, Nevada county, Cal. D. McLaughlin.

Silver Ore (?)—Waterman mine, Grapevine district, San Bernardino county, Cal. A. M. Lawver.

Silver Ore—El Robles mine, Sinaloa, Mexico, 70 miles from Mazatlan. John Wasson.

Silver Ore—Jackson mine, Esmeralda county, Nev. Wm. H. Sears.

Lignite—Oregon. Oregon Steam Navigation Co.

Gold Quartz—Golden Hero mine, near Copperopolis, Calaveras county, Cal. J. K. Hicks.

Granite of which the Mormon Temple is Built—Salt Lake City, Utah. J. W. Wilkinson.

Silver Ore—Monumental mine, Granite mining district, Grant county, Oregon. C. S. Miller.

Wall Rocks of Monumental Mine—Crant county, Oregon. (See No. 3431.)

Foliated Talc—Altaville, Calaveras county, Cal.

Silicified Wood—Nevada county, Cal. J. Z. Davis.

Pig Iron—Oregon Iron Co., Oswego, Clackamas county, Oregon. Allen & Lewis, agents.

Iron Ore, Prosser Iron Ore—Oregon Iron Co. Allen & Lewis, agents.

Diatomaceous Earth—Cayetano ranch, Santa Clara county, Cal. J. E. Bowman.

Jeff risite—Alaska. Thos. McCully.

Psilomelane—Alaska. J. H. McMillan.

THE Shasta *Courier* says: Quite a number of practical and wide-awake quartz prospectors from other counties have lately come to Shasta to hunt for quartz, and several of them have told us that the mining interest of this county is attracting considerable attention,

News in Brief.

JOSEPH DE CAISNE, the distinguished botenist, is dead.

THE Yuma *Free Press* states that the steamer *Mohave*, on her last trip up the Colorado river, took 44,000 lbs. of grain and merchandise, and 10,000 lbs. of machinery.

CHAS. W. STEVENS died Monday in New York. He built the first locomotive run in California, and superintended the building of the first railroad in Oregon.

THERE are several prisoners in the County Jail, says the Gold Hill *News*, who are imprisoned for trifling offenses, committed in order to procure free board and lodging.

NOTHING more will be heerd about admitting M. D. Ball as delegate from Alaska till the Committee on Territories report on whether or not Alaska will be organized as a Territory.

THE San Jose *Headlight* states that in the middle of the Pajaro river a subterranean spring has appeared, discharging water, quicksand and mud, which is forced to a distance of several ft. above the river's surface.

THE House Commerce Committee have reported favorably Berry's bill to erect a light-house and fog signal at Point St. George, Cal. It is to be located northwest of Seal Rock. Fifty thousand dollars is the amount appropriated.

LEADING members of the House Banking Committee say that after consideration of the subject they are confident that the House will pass the bill making the trade dollar a legal tender, and that the interest which opposed it before will now allow it to pass.

LARGE fires were raging in several of the Sacramento river islands last week. West's island was almost entirely denuded of vegetation. The air was filled with flying cinders and smoke. Some of the fires are reported to be the work of careless hunters.

ALLISON, Chairman of the Senate Committee on Appropriations, has a letter from the President of the Pennsylvania Railroad Co., in which he says: "Our company had at no time, nor have they now, any intention to make any claim for compensation for the courtesies extended to the late President and his family or to the officers of the Government."

THE following circular has been issued by the Treasury Department: On the exportation of flour wholly manufactured from imported wheat the drawback will be allowed at the rate of 89 cents per barrel, less the legal retention of 10%. Collectors will see that proper arrangements are adopted by mills within their districts, where flour may be prepared for exportation with the benefit of the drawback to imported wheat at any stage of the process of its conversion into flour.

ANNUAL STATISTICIAN.—We have received a copy of McCarty's "Annual Statistician" for 1882. It is scarcely possible to think of any general statistical information which is not given in brief form in this little book. The chronological tables are very complete and condensed. Its geographical information is also very full. The biographical index gives the name, vocation, date and place of birth, etc., of 4,250 of the most prominent men and women of the last 3,000 years. There is a large mass of information about the United States; and about the revenue, expenditures and public debt of all the principal nations of the globe. Mathematically it is replete with tables of all weights, measures, units, and all sorts of things. Of the Pacific States, it contains the governors and rulers' from their commencement to date; population by counties; population of every city, town or locality; cereal productions; minerals produced, imported or exported. Miners' inches, and force of water illustrated; hydraulic pipe and hurdy-gurdy wheels as used on the Pacific coast; and every presidential, congressional and gubernatorial election ever held in California (by counties), from 1851 to 1880. Every presidential election ever held in San Francisco; and every earthquake felt in San Francisco, for the past 30 years. Even a summary of the contents would take a great deal of space. The book is a very handy one for reference containing, as it does, such large and varied contents and such a very wide range of subjects within one pair of covers.

THEORY OF GRAVEL CHANNELS.—In the correspondence column of the PRESS of Oct. 8, 1880, appeared an article advancing a theory of the formation of gravel channels, addressed to the editor of this journal and signed "L." This article was copied in the report of the Director of the Mint and credited to this paper. Shortly afterward an abstract of the theory was telegraphed to this coast, and published in the Associated Press as the theory advanced by the Mint Director. Knowing it had originally appeared in these columns and that the Mint Director had given proper credit in the publication under his control, one of the editors of this journal wrote an item to that effect. In that item, however, it was stated that the theory was written by "the editor of this journal," the writer supposing it to have been written by one of his associates. This was an error, however, the credit being due to Mr. A. Larson, of Dutch Flat, Placer county, who wrote the original article. As his name was not signed to it the Mint Director did not credit him with it, though the PRESS was credited. It was simply an oversight in our not connecting his name with it in the instance above mentioned.

PERSONS receiving a sample copy of the MINING AND SCIENTIFIC PRESS *with this notice marked*, are requested to examine the merits of the same, and consider fairly its claims for support, and if consistent, subscribe for the paper through the P. M. or agent delivering it, or otherwise. We shall send it, on trial, at the rate of $4 per annum for any period the reader may wish. Please notice our terms elsewhere, and if desired, send for further samples and information. Those who can circulate this No. further to our advantage are invited to do so.

A TURNED LEAF will point out the article supposed to be of special interest to persons receiving sample copies of this paper.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $3 per (half-yearly) volume. In cloth and leather binding, $5. These volumes, complete, are scarce and valuable for future reference and library use.

CORRESPONDENCE on mining and other subjects represented by this journal is solicited from all reliable sources. Send us information, early and often, if ever so brief.

BY TELEPHONE.—Subscribers, advertisers and other patrons of this office can address orders, or make appointments with the proprietors or agents by telephone, as we are connected with the central system in San Francisco.

THE State Mining Bureau, No. 212 Sutter street, is open to the public from 10 o'clock A. M., to 5 o'clock P. M. daily, (Sundays excepted). Henry G. Hanks, State Mineralogist.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

G. W. MCCREW—Santa Clara county.
M. P. OWEN—Santa Cruz county.
B. W. CROWELL.
J. W. A. WRIGHT—Merced, Tulare and Kern counties.
JARED C. HOAG—California.

ANNUAL STATISTICIAN of 1882.—"It is the most complete and accurate work of its kind in the world."—*S. F. Call.* Address L. P. McCarty, 816 California st. Price, $4.

Dewey & Co.'s Patent Agency and Newspaper Offices.

Dewey & Co.'s Patent Agency and the business offices of the Mining and Scientific Press, Pacific Rural Press, Pacific States Watchman and the Fraternal Record are now avorably situated at No. 252 Market Street. Elevator entrance, *No. 12 Front St., S. F.*

Business Offices and Sunny Rooms to Let.

We have some desirable rooms to let adjoining the offices of this paper which will be rented on favorable erms. Stair entrance, No. 252 Market St. Elevator, No. 12 Front St. Parties wishing offices, etc., will do well to call and see them. DEWEY & CO.

Cylinder Printing Press for Sale.

DEPUTY U. S. MINERAL SURVEYOR.

Surveys for Location or Patent. Maps and Plans Drawn. Mining Properties of all kinds examined and careful reports made of the same. Consultations on Mining Investments. Address, THOS. W. REECE, CIVIL ENGINEER, Oroville, Butte Co., Cal. References given and required.

PACIFIC POWER CO.

Room with steam power to let in the Pacific Power Co.'s new brick building, Stevenson street, near Market. Elevator in building. Apply at the Company's office, 314 California street.

Inventors L. PETERSON MODEL MAKER.

Models for the patent office in wood or metal, a specialty. No. 328 Bush St., between Montgomery and Kearny, up stairs, S. F. Experimental machinery and all kinds of tin, copper and brass work.

"THE $1,000 CHALLENGE"

Ore Feeder for Quartz Mills.

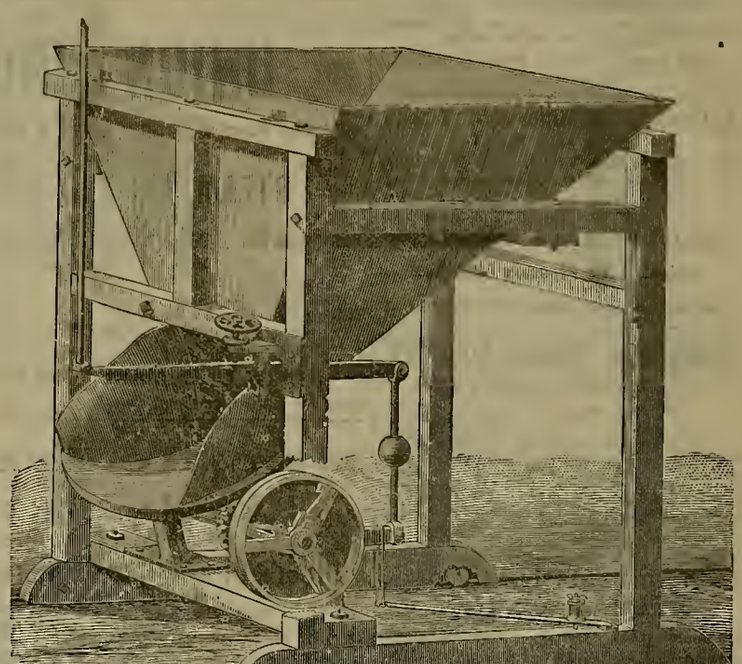
OVER 800 ARE NOW IN USE, GIVING ENTIRE SATISFACTION.

Awarded First Premium at the Tenth and Twelfth Industrial Fairs of the Mechanics' Institute.

Twenty Per Cent. More Ore Crushed with Fifteen Per Cent. Less Wear of Iron than by Hand Feeding.

The accompanying cut illustrates the recently introduced Grip, and also the Spring Attachment, which replaces the Weight heretofore used, and which are obvious improvements.

It is now fully demonstrated, after careful and long continued experimentation and practical use, that the plan upon which a perfect Ore Feeder must be constructed is that of a carrier, and not that of a shaking-table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane or table, to the line of discharge, and there simply dropped. Jerky or spasmodic contrivances will not answer the purpose for wet or sticky ores



The Challenge Ore Feeders are now in Use in the following Mills, besides many others

Soulsby	20 Stamp	Tuolumne county,	Cal.

Hidden Treasure	40 "	" "	"

Superiority of the "Challenge" Ore Feeder Demonstrated!

At the "Christy" Mill, Uintah County, Utah, the "Eclipse" Feeders, (conceived by E. Coleman) were introduced, but not carrying a regular supply of ore for the crushing capacity of the stamps, were replaced by the "Challenge," which are now running and the stamps crushing forty (40) per cent. more ore than was done by the "Eclipse."

The "Harshaw" or "Hermosa" Mill, of Patagonia District, Arizona, was also originally fitted with "Eclipse" Feeders, but after a few weeks trial they were pronounced inadequate to the work, discarded, and the "Challenge" adopted.

The "Silver King," Mill of Arizona, also removed the "Eclipse" Feeders to give place to the "Challenge."

The "Sola" Mill, of Brown's Valley, Yuba County, Cal., was fitted with "Victor" Feeders, manufactured by E. T. Steen, but proving insufficient, the "Challenge" Feeders were substituted.

Four of the "Victor" Feeders, manufactured by E. T. Steen, were also placed in the "Alexander" Mill, at Grantsville, Nevada, but after a fair trial were discarded, and Hendy's Feeders fitted, and four others of the same pattern added when the second twenty stamps were erected.

These cases are simply cited from among many similar instances, in proof of the vast superiority of the "Challenge" Feeders over all others.

JOSHUA HENDY, Agent,

Machine Works, 49 and 51 Fremont Street, San Francisco.

Manufacturer of Quartz Saw Mill and General Machinery. Also Agent for BAKER ROTARY PRESSURE BLOWERS, and WILBRAHAM ROTARY PISTON PUMPS. P. BLAISDELL & CO.'S Machinists' Tools. HOT POLISHED SHAFTING from the Akron Iron Company, of Akron, Ohio.

Dealer in New and Second Hand Engines, Boilers, and all Descriptions of Machinery.

COKE. PATENT. COKE.
This COKE is exclusively used by Prof. Thomas Price, in his assay office, by the Selby Smelting and Lead Co., Prescott, Scott & Co, Risdon Iron and Locomotive Works and others in this city. Large supplies are regularly forwarded to consumers in Salt Lake and Nevada, to the Copper Queen Mining Co., Longfellow Copper Mining Co. and other consumers in Arizona.
The undersigned are in receipt of regular supplies from Cardiff, Wales, and offer the COKE for sale in quantities to suit purchasers.

VOLUME XLIV Number 8.

New Ore Smelting Furnace.

The object of the ore smelting furnace shown in the accompanying engraving is to provide means whereby impurities, such as sulphur, arsenic, antimony, etc., may be eliminated from the ores, and the noxious fumes arising therefrom be destroyed within the furnace and its adjuncts. Fine ore or tailings may be worked by it; and the furnace is also adapted for the use of carbureted hydrogen gas, in the place of ordinary fuel.

The invention, which is that of Robt. Hinvest, of New York, consists in the combination with a smelting furnace having a closed top, or dome, and provided with appliances for the consumption therein of carbureted gas as fuel; of a condenser, or series of condensers, placed intermediately between the main furnace and an auxiliary furnace and fire-place, so that the noxious fumes that pass out of the main furnace may be either condensed in the condenser, or consumed in the auxiliary furnace, by which means the escape into the outer air of any noxious gases or fumes arising from the process of smelting is prevented.

The invention consists, also, in the combination—in a smelting furnace of a closed top or dome, a series of slanting or overhanging shelves for retarding the descent of the ore, a series of radial openings into the fireplace for the introduction of carbureted gas as fuel, and a condenser, or series of condensers, and an auxilliary fireplace, by means of which combination the three processes of desulphurizing, smelting and destroying the noxious fumes are all effected simultaneously in what is practically one structure. The two figures of the engravings are vertical sections taken at right angles to each other, and similar letters of reference indicate the same parts on each figure.

The main body of the furnace, *A*, has a closely-covered top or dome, *a*. *D* is the hopper through which ore is fed, and which is covered by a self-acting gate or door, *C*, on the inside. *B* is the fireplace at the lower part of the furnace; *d* is the opening or tube through which the slag is discharged, and which serves the purpose of an air inlet for the supply of atmosphere oxygen to support combustion.

E is a condenser, one or more of which may be used, into which any sulphurous or noxious fumes which pass from the furnace are received, and in which they are condensed and held in the form of sulphurous acid. Attached to the condenser, which is furthest from the furnace, is a small auxiliary furnace or fireplace, *F*, (having an open top) in which a fire is kept up, so that any portion of the fumes which escape from the condenser or condensers are burned up therein and prevented from passing into the open air. This furnace, *F*, forms the draft exit.

H H, represents inclined or overhanging shelves, to be used when disintegrated ores or tailings are being smelted. These shelves are supported near their edges by transverse arches, and they slightly overhang each other, as shown in the drawings.

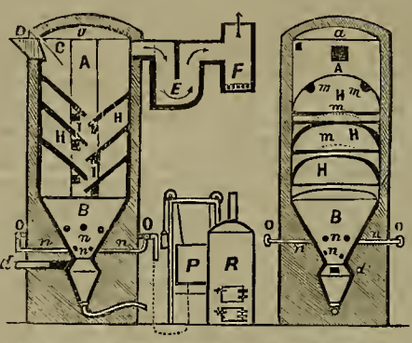
The tailings being received upon the shelves are thereby retarded in their progress while being acted upon by the gaseous heat, so that they are desulphurized and pass into the lower part of the furnace in a partially melted condition, thereby ensuring, the inventor says, the extraction of the sulfion from the ore, and freeing the same from impurities and also preventing packing in the lower part of the furnace. Openings *M*, are provided in the said shelves to assist the upward draft.

For the purpose of adapting the furnace for the use of carbureted hydrogen gas therein as a fuel, a series of radiating tubes, *N*, is provided, which enter the fireplace or lower part of the furnace from the outside, where they are connected with an annular pipe, *O*, which takes the gas from a gas holder or receiver, *P*, and through these tubes, *N*, the said gas is injected under a suitable degree of pressure into the fireplace or lower part of the furnace, and there ignited, producing a heat of great intensity.

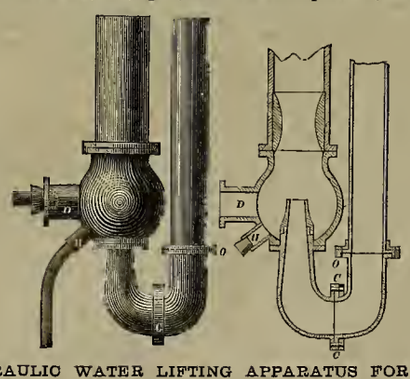
Into the gas-holder or receiver *P*, the gas is supplied from an apparatus for generating carbureted hydrogen gas which is designated by the letter *R* in the drawings, and which is constructed and arranged for producing carbureted hydrogen gas from petroleum or the hydrocarbons by means of superheated steam, which is mingled with the vapors of the hydrocarbons. The shelves may be dispensed with when the furnace is being used for smelting ore of ordinary size.

Hydraulic Mine Draining Apparatus.

The main object of the machine illustrated on this page is to go in combination with a hydraulic gravel elevator for the purpose of setting or sinking in watery locations where there is no drainage. In certain places it has been found difficult to get the elevator down to the proper level to work the mines; and, again, the elevator has become covered with water so deep that it was difficult to get at for the purpose of repairs. In such cases the "hydraulic water-lifting machine" here illustrated has served to drain the claim.



SMELTING FURNACE FOR FINE ORES.



HYDRAULIC WATER LIFTING APPARATUS FOR MINES.

This machine can also be used to advantage in certain drift mining, and in places where it will not pay to use the large machines, and work all the material from the top. The machine works on precisely the same principle as the hydraulic elevator, but it is not constructed or intended for hydraulic mining. It is intended to work in a perpendicular shaft or sump, but can be made to lift at almost any angle, and can be connected at almost any angle with the hydraulic pipe.

It has two flexible or swivel joints, *O*, *C*, which allow it to be set in almost any position, and connected with the hydraulic pipe. The hydraulic pipe is connected with the main stand pipe, and as the water passes down and up through the nozzle shown, the water from the mine is drawn up through the small pipe, *H*, and passes upward with the main body, the large inlet, *D*, being closed. In case, however, there is a good deal of water, the pipe *D* is left open also, or gravel thrown in there, too.

This machine will be found of great advantage in combination with the elevator, or in drifting where water can be obtained to drive. It can be utilized to raise the drift dirt, and also will act as a ventilator, by withdrawing the foul air from the bottom of the mine, as the machine has a strong air suction, or draft, when it is not drawing water or dirt.

When used in combination with the gravel elevator as a sump or drain, it is generally placed at the bottom of the shaft, somewhat lower than where the elevator is situated, so as to drain everything into it; and can be driven by a branch pipe taken from the main pipe that drives the elevator. It must have a cut-off, or gate, to shut off the water when not in use.

This machine is not required to run while the elevator is in operation, for that is a sufficient drain; but, as above stated, is only required when the elevator is not running. This device is small and light, is easily set and moved, and does not require very much water to run it. It will lift, (Mr. Joshua Hendy, 51 Fremont St., the manufacturer, tells us,) about as much water as is required to drive them, and will lift higher than the gravel elevator with the same pressure.

A NEW GOLD DISTRICT.—A dispatch from Victoria, B. C., says: Last summer a man named Barney Johnston went to Chilcat, crossed the Coast Range and reached a point 50 miles from Fort Selkirk, on the Yukon river at the mouth of Lewis river. There he found a gold belt running across the country, from east to west, the same as in Cassiar, Ominca and Carihoo. He prospected and obtained fine gold everywhere along the line of this belt, which, of course, he did not explore fully, as it had taken him a long time to get in, and very little of the season was left to work. He saw that all presented a first class appearance. Indians and fur-bearing animals are numerous in the country, the altitude of which is not so great as that of Cassiar and the climate better. The diggings lie about the 60th parallel of latitude. North of this degree the boundary of British Columbia does not extend, and, although the new gold field lies in British territory, it undoubtedly owes allegiance to the Northwest Territory.

Academy of Sciences.

The regular meeting of the Academy of Sciences was held on Monday evening last, Prof. George Davidson in the chair. The following were elected life members: Walter E. Dean, A. K. P. Harmon, Isaac L. Requa, John G. Kellogg, A. W. Mauning; and resident members elected were F. A. Hyde, Henry Ferrer, M. D., Charles G. Hooker, Charles E. Apponyi, William F. Nolte. The following were proposed for life members: Henry T. Soott, Wm. T. Coleman; for resident member, Arthur A. Smith.

Donations to the museum were as follows: From the Alaska Commercial Company, a handed seal from Behring sea; from W. G. W. Harford, a Mexican ant-eater; from Dr. A. F. Sawyer, a fine classified collection in glass cases, containing 224 samples of useful vegetable products, including woods, seeds, fibres, etc.; from E. F. Lorquin, two meadow larks; from Frank Mank, agent of S. P. R. R. at Monterey, Cal., a long section of kelp, washed ashore, and found filled with small fish resembling sea perch. These fish were packed in the kelp as close as they can be stowed. He asks the academy: "Do these fish hibernate in the kelp, or did they crowd in there to escape enemies?" From Capt. Ferdinand Ciprico, a dried and mounted flying fish, caught in latitude 11° south.

Prof. Davidson announced the death of ex-Lieutenant-Governor Purdy, whom he said had, in early days, presented many valuable gifts to the Academy. He then spoke of the scientific labors of Prof. Henry A. Ward, of Rochester, N. Y., whom he heartily endorsed as one who had done more than any other man within his knowledge, to facilitate and encourage the study of fossil remains, and their proper distribution among the various scientific museums of America and the world. Prof. E. T. Cox endorsed Prof. Davidson's remarks and said, in the East Prof. Ward was regarded as a savant of great merit. Prof. Ward then spoke for an hour, giving an interesting account of his life-work in collecting specimens. Prof. Ward has a collection here in this city amounting to upwards of 150 tons, which he will shortly exhibit. It is to be hoped some of our rich men will see thet they will be kept here. We shall speak further on this subject hereafter.

At the next meeting, the first Monday in March, Prof. Joseph LeConte will read an interesting paper; also, Prof. Davidson will treat of temperature of sea water on this coast during the past nine years, and Prof. Ward will speak on the mammoth and other monsters of past ages.

LUNING.—Thie new and springing town is growing rapidly. Already town lots are staked off and streets laid out with all the style of a large city. Several new buildings are now in process of erection, and before 60 days Luning will be a place not only in name, but in reality. It is the center of a rich mining district and the depot for all supplies for Grantsville, Ione, Ellsworth, Downeyville, Cloverdale and the different camps to the eastward. Gillis Mountain, Garfield and the mines adjacent all look to Luning for supplies. The mines are proving rich wherever any work has been done and the chloriders are all heppy.—*Candelaria True Fissure.*

CHISPA.—It pays to perambulate the streets of this modern Jerusalem after a rain-storm, not on the sidewalks, however, not staring into shop windows nor gazing at the stars, but by keeping your optics directed earthward. Last week, Andrew Blize, Esq., while passing along Main street near Danz's wagon shop, picked up a handsome little nugget of gold worth $16. After a rain-storm it is no uncommon thing to pick up nice little specimens on our streets. Don't talk to us of planked streets or cobblestone pavements.—*Calaveras Chronicle.*

COLORADO miners are looking toward Utah for investment, and they think Salt Lake is the next city to receive a big boom.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

Inyo County Mines.

Smelting Lead Ores.

EDITORS PRESS:—To use an oft-repeated phrase, Inyo county has a black eye as far as its mining interests are concerned. Many efforts have been made during the past three years to dispose of really valuable mining property, some as prospects only, and some as partly developed mines; but with one or two exceptions all efforts have failed to induce capital to take hold. The word has gone forth that there are no mines in Inyo county. Now we are prepared to dispute that assertion, and not only dispute it, but claim that Inyo has more and better prospects than any other county in California. Why is it said that we have no mines? But very few mining men will come here to see if we have or not, and most of those few come prejudiced. They make up their minds before they come that there is nothing here worth looking at, and when they get here they will not take any pains to go around and see what we have to show them for fear that they might see a good mine, and have to change their minds. "There are none so blind as those that will not see."

It is true there were a number of failures here in mining ventures some twelve or fifteen years ago. Two or three mills were built at great expense before any mines were found to furnish the mills with ore. Smelting furnaces were erected by parties who were totally ignorant of the smelting process. They made disastrous failures, not through a want of ore to smelt, but through a lack of skill in handling it. Bad management and extravagance finished the business, and the spectral wrecks of old mills and furnaces stand here to-day as monuments of former failures. These failures occurred at a time when but comparatively little was known of milling ores, and much less of smelting. It is no wonder that men who never before saw a smelting furnace, and knew absolutely nothing of metallurgical operations and the chemistry of ores, should make complete and utter failures of their attempts to smelt ores. Of course the fault was charged to the ores, or want of ores. They could not be smelted, or there was none to be had after the furnaces were built. And so Inyo got a black eye from which she has never recovered.

Smelting lead ores is now reduced to a simple process. Any ores can be smelted if they contain from 35% to 50% of lead. The skillful smelter knows the compositions of his ores, and he makes the combinations necessary to produce the desired result. As an instance of how smelting works were conducted here a few years ago, the works at Swansea on Owen's lake are a good example. In the first place, the furnace was built in a hole, or on the lowest spot of ground to be found in the locality. There were no slag dumps; it had to be wheeled out on level ground, and piled up. A large quantity of ore was put through this furnace, and considerable bullion shipped, notwithstanding the rude way in which the whole business was managed. The interesting remains of the Swansea smelting works now consist of the slag pile. Probably 3,000 tons of this material is now lying near the old works, which the writer has examined a number of times, taking samples and making assays of several different kinds of this slag. The result of these investigations shows percentages of lead from 15 to 50, average about 30%; and in silver, from 15 to 70 ozs., average about 30 ozs. per ton. There are besides in this slag pile tons of bullion in the shape of nuggets of lead weighing from 200 grains up to 1 lb. each. Comment is unnecessary.

In almost every case where mines in the Inyo range have been developed to any considerable extent they have proved to be permanent and valuable. The Union Con. Mining Co., of Cerro Gordo, have run out of their furnaces over $13,000,000 worth of bullion, and there is good authority for stating that when the company stopped work large bodies of ore were left standing in the mine, which had reached a depth of 900 ft. The famous Ygnacio mine now shows thousands of tons of high-grade ore. The San Lucas is another of the same class, and still there is not a half dozen picks being struck in the whole district. The place is nearly deserted and dead. A very few of the old timers who hold interests still "stay by the pot," and hope for better times.

In the Beveridge district, which adjoins Cerro Gordo on the north, the rich Keynot gold mine was discovered about a year ago. It has turned out over $125,000 worth of gold, with a little 5-stamp mill, and the mine still improves as it is opened. Several mining men have been here to look at this property, but as it was in Inyo county they concluded that it was not a safe thing to invest in. The Brown Monster mine, in the Russ district, which has reached a depth of 500 ft. and has a vein of gold quartz 6 to 8 ft. in width which averages $25 per ton is also in Inyo county, and for that reason it cannot be of any value. The Hirsch mine, in the same locality, is another valuable gold ledge. These two mines are most conveniently situated for working and have a splendid water power, furnished by the Owen's river, within three miles of the property. These ores can be mined and milled at a cost of $4 per ton.

The Union district, adjoining the Russ on the north, shows a great number of splendid prospects for smelting ores as well as milling, gold and silver ledges. But little work of development has been done in this district, except short shafts and tunnels of from 20 to 100 ft. in extent. The Union is the most accessible and open of any of the mining districts in the Inyos, and with every facility in the shape of wood, water and good roads that could be desired. The great drawback to this district is that it is in Inyo county. Bishop Creek comes last on the north, with its Poleta and other rich gold mines. The Poleta was sold a few months ago to San Francisco parties for $30,000, and the work of development has been going steadily on since the sale. A depth of 340 ft. has been reached, and the shaft shows rich ore from top to bottom. The districts of Darwin, Lookout and Panimint, in the southern part of the county, have not been mentioned, as the object of this letter is more to show the mineral wealth of the Inyo range from Cerro Gordo north. X.

The Piru Mining District.

M. G. Fitzgerald has been prospecting for a long time in the Piru mining district, where he has valuable interests. He states that he is an old prospector, and has seen every mining camp of any reputation on this coast, from Rogue river to the Sonora line, and has more faith in this, as a rich mineral belt, than any of all the great number it has fallen in his way to examine. It takes its name from Piru creek, which runs through it in a southerly direction, carrying, according to the season, from 100 to 1,000 inches of water, miners' measurement, and has placer diggings along the banks that have been profitably worked. It is about 25 miles in width by 50 in length, and is a strongly-marked mineral belt, containing mineral veins of almost every kind—such as gold, silver, copper, lead, tin, iron, bismuth, antimony and coal, with strong indications of coal-oil. It is abundantly supplied with timber of all kinds, water and grass. It has never attracted the attention of that class of men who get up booms in mining camps. Those who frequent it are poor men who go there to make a raise, working the rich gold quartz they find in arastras. It is frequented by a considerable number of such persons who go there with no speculative ideas whatever. They are supplied from Los Angeles, and their trade is worth to the merchants of that city from $3,000 to $5,000 per month. The district is principally in Ventura county, and the part around which the principal interest centers and the work is mainly done, is distant 55 miles from Bakersfield and 112 from Los Angeles. The principal lode is called the Frazier mine. During the time it was worked, a period of eight years, until operations ceased on the 31st of October, 1879, because of litigation arising from disputed ownership, it is believed to have yielded about $1,000,000 in gold. The difficulty is now said to be on the eve of settlement, and it will be worked by more improved methods and on a larger scale than ever. Hitherto it has been worked by men not well qualified to conduct any business successfully. The vein varies from two to 16 ft. in width and will average eight ft. The ore contains a small percentage of silver which seems to increase with depth. At the depth of 250 ft. this amounts to $6 per ton, while there is only a trace on the surface. It is filled with iron and other sulphurets that assay from $300 to $3,500 per ton. They are all saved. There is no means of treating them at the mine. But the yield in free gold is from $15 to $25 per ton. A ten-stamp mill—not a very good one—run by steam power, is connected with the mine. There are many other claims in the vicinity that are successfully worked, yielding from $500 to $3,500 yearly, by the arastra process. One of these, the Castac, a small rich lead, has yielded about $15,000. This, with several others of a similar character, were shut down for several years because of the death of the owner, but recently resumed successful operation. A two-stamp mill and an arastra are attached to the property. Some of the most valuable leads cannot be worked by the free milling process, because they contain lead and therefore lie idle for the present. One of these, the Mountain Chief, a large, well-defined vein, gives an average working test of $31 in gold and $40 in silver per ton. The ore is also charged with rich sulphurets. Probably one of the most valuable leads in the district, if it were in some other place, is a vein of magnetic iron, 50 ft. in width, containing 52% of this useful metal. From the account of Mr. Fitzgerald, it evidently is a good place for those to examine who feel disposed to devote their time and money to acquiring and developing valuable mines.—*Kern County Californian.*

AN OIL WELL IN THE GULF OF MEXICO.—A curiosity in the Gulf of Mexico has been discovered. It is a harbor in the open gulf, fifteen miles from land. A kind of oil is thrown up by the processes of Nature, and rests upon the surface of the water in a thick scum. The effect of the oil is so great that even in the severest storms the sea in this peculiar harbor is comparatively smooth. This is so well known that when a storm approaches small vessels run for this "oil pond," as it is called, and ride out the gale in safety.

Our Quartz Mining Industry.

We are highly pleased to notice that some of the Georgetown smarties—those who apparently think that what they don't know about the hidden treasures isn't worth knowing—are beginning to fall into line with the little army of progressive spirits who have been laboring unceasingly to open up and bring to the notice of capital our mineral and other resources. Probably there is not another town on the mineral domain of this grand Pacific coast which contains so many pull-back people as there were, until recently, in Georgetown. But they cannot win, no matter what their motives may be, whether envy or disappointment, or a lack of practical experience in the economical methods of prospecting and working low-grade ores and gravel. In nearly every instance, the class of whom we speak are old-timers, men accustomed to rich placer and seam diggings (yet, to the credit of many of our early miners, we are proud to find them among the most enterprising and successful of our progressive miners), but it is a well-known fact that nearly all of the quartz discoveries made within the past few years were by men who came to this country since the palmy days of placer and seam mining. Many of the good old pioneers were aware of the existence of gold-bearing ledges, which prospected only a few small colors—probably $12 or $15 rock—which they little thought would, in the near future, prove a better property than their ounce diggings. Men accustomed to making money easy and spending it freely, are usually not the men to see a fortune in quartz which prospects as low as $5 or $8 per ton, and even should they see it, few have the patience to stay with the lode and develop it into a good property. To-day there are golden opportunities in undeveloped quartz mines all along this divide.

A few years hence many will regret they did not prospect more carefully and extensively their claims. Of course we know that it's not all gold that glitters, and that every ledge which shows a prospect will not prove a paying property; but we do claim that a little more energy on the part of claim holders will surely add several more good mines to this district. Then in the face of this reasonable view, and the fact that several new mines and mills have already started up in this county, is it not high time these "anti-miners" and "anti-progress" men, or growlers, or whatever appropriate name you may call them, were seeing the folly of their course, and taking an active part in the encouragement of bringing to light the millions of hidden treasure which no sane person can reasonably doubt lies within a practical working depth within the limits of Georgetown district alone. Shall we not increase our energies and explore our mines to a reasonable depth, rather than linger along for years, and finally leave the work and its fruits to the experienced quartz miners of Grass Valley and other go-ahead camps, who are already looking this way. We do not wish to portray this subject in a false light, nor as an enthusiast. We are simply trying to show up our mining advantages as they are, and giving a few words of encouragement to our miners, as well as chiding those who appear to have a mania in crying down our quartz mining industry. Time is certainly demonstrating that these anti-miners don't know it all.—*Georgetown Gazette.*

THOSE OBSTINATE ORES.—All along the Sierra, from the northern end of the State to their termination in the south, veins of ore bearing precious metals have been discovered. Those on the lower slopes have proven rich and remunerative, but those found along the summits, as a general thing, have proven failures. The ore-bearing veins of the upper regions are large and plainly defined, are easily mined and return fabulous amounts under assay, but when put to a milling test have signally failed. The excuse for failure by milling process has always been that the ores were rebellious and would not yield to the ordinary processes. Whether this be true or not, the fact exists that the ores do not pay by mill process. Meadow Lake, Silver Peak, Mineral King and many other mining districts stand as witnesses of the unfortunate fact. It does seem that somebody will soon find the key to unloose all the mineral wealth that lies locked in the ore veins along the summit of the Sierra in this county, and we have faith that in time the precious metals will be extracted from them and turned loose to enrich those who are bold enough to develop and work them.—*Nevada Transcript.*

WILD-CAT MINES.—It seems that there are a number of wild-cat mining schemes in Idaho. The local mining journals generally take an attitude of decided opposition to all such swindling. Apropos of the New York and Idaho Gold and Silver mining company, and the Golden Horn Mining and Milling company of Idaho, the Yankee Fork *Herald*, of the 26th ult. says: "There are any number of good mines in Idaho for sale at reasonable figures, and it is a detriment to the mining interests of the Territory to foist wild-cats upon an unsuspecting public. Every newspaper in the mining counties should sit down on the 'wild-cats' and crush them out of existence. We propose to do it, and don't you forget it. Some of Idaho's camps, and none more notably so than Atlanta, have been set back by just such swindles as that mentioned above, and it is time there should be a stop put to it."

Copper for Old Iron.

A Mine That Makes the Trade Even in Chrome Iron.

Two years ago, a mine was operated by Wm. Utter, at Campo Seco, near Milton, says the Stockton *Mail;* water came in and work was stopped. To keep the large iron-bound and iron-baled bucket used to hoist rock from drying up and falling to pieces, it was let down into the water. Next season when it was drawn up, lo, a miracle! It was copper-baled! From this has sprung quite an industry, and the mine has been sustaining itself from water and ore ever since. The water contains an acid which has the property of taking into solution the particles of iron thrust into it, and it has also copper in solution, which is let go particle by particle as the iron is picked up. It is a simple chemical exchange, and this mine may make another profit still, if it will get another chemical into the water which will make the acid lay down the iron which, as a black flood, the water carries down into the Stanislaus river.

The copper industry consists in taking bundles of scrap iron and tin to the mine, where it is thrust into vats of the water caught up, in which the metals are soon changed into copper, the residue of the iron taking the form of a black stream and flowing away. To make sure of making the water swap all its copper for iron, which it is glad to do without boot, one vat is placed below another down the bank to the river, and when the water escapes it has eaten its fill of iron, and left pay for its meal in genuine copper.

There are other mining interests in that section which are paying also. One Barrett is opening the Napoleon mine for a New York and Philadelphia company. It is situated about 10 miles south and east of Milton, and has chrome iron ore which carries gold and silver in greater or less quantities. Utter has a big pile of like ore, about 1,000 tons, at Milton now awaiting shipment to San Francisco, en route for Swansea. The finer portions of the ore are sacked, the rest is in bulk. It has been found there is gold and silver enough in the ore to pay all transportation from the mine to Swansea, which leaves all the other valuables of the ore for profit. At Swansea the coarser portions of the chrome ore is ground into paint, and the better portions, after taking the gold and silver out, is for dying green and changeable silks, giving the finest and most durable colors.

There are at Oakdale 1,000 tons of this chrome iron ore which has been brought in about 25 miles from a mine near the Sonora road by Kruse & Euler, and the ore has the same destination as that above mentioned.

The Mines on Military Hill.

The Tombstone *Epitaph* says: Military Hill is a locality little heard of in the mining reports of this district. This is a high, limestone hill, about one mile south of and a little to the east of the Grand Central mine. At its northwestern base is the Emerald mine, somewhat widely known in mining circles. Going south, skirting the western slope of the mountain, we find the Side-wheel, Huguenot, Corona, Rattling Boy, Wampum and Silver Plume, all prospects of great promise, and particularly the Side-wheel and Rattling Boy. The former of these two last-named claims has a continuous outcrop of rich manganese ore throughout its entire length. Assays from the surface of this vein range from $18 to over $500 per ton. This vein where exposed in two shafts, the one six ft. and the other 10 ft. deep, is fully 2½ ft. thick, with indications of steadily widening. The dip of the ore appears to be to the east, or into the mountain.

Going around to the south and east slopes of the mountain, we find the Big and Little Pedros, Idaho, Ivanhoe, Mattie H. and Honeycomb, all good prospects, and more particularly the two Pedros. Upon these two locations there is a most remarkable mineralization of the surface. It seems that almost every crevice received its share of the precious metals during the process of deposition. Another peculiar feature is that upon the eastern slope the veins all dip west, or into the heart of the hill, which fact, taken in connection with the western veins dipping east, inferentially would lead one to expect a mammoth deposit of rich ore under the center of the mountain. A good deal of work has been done upon the Pedros, developing a fine showing of rich mineral. One shaft sunk on an adjoining claim, about 50 ft. east of the Big Pedro, has developed a strong, well defined lode, with a strike directly through the heart of this location, and a little to the south of the summit of the mountain. There is also a large outcropping of quartz, carrying rich sulphurets of galena, about 200 ft. to the west of this shaft, which cropping is on the Big Pedro, and in our opinion is strong presumptive evidence of the continuity of this ledge through the mountain.

Upon the northern summit of the hill is the Green Cloud mine, upon which there is an incline shaft down about 100 ft., developing a strong vein of ore, much of which is very rich. We saw about thirty tons of first-class ore on the dump, with, perhaps as much more second-class. This is a very good showing for a valuable mine, and demonstrates the fact that Military Hill is one of the most thoroughly mineralized portions of Tombstone district. Time and thorough development alone can tell the amount of latent wealth hidden away in the recesses of the silurian landmark.

MECHANICAL PROGRESS.

The Blacksmith's Forge.

A blacksmith's forge is a simple affair, aad it is commonly believed that whon you have seea ono you have seem them all. A blacksmitb's shop is a common place matter. There does not appear to be any room for the display of inventive ingenuity either in its arrangemeata or its appointmenta. Every blacksmith will tell you that blacksmitha' shops are abont the same everywhere, and that his trado of all the mechanical parsnita admits of the smallest degree of individuality. Anyone who would dispnte these commonly accepted facts woald probably run foul of the entire craft, and yet we propose doing that very thing. Further, we propose to advance argaments in proof of the assertion that there is quite as much room for inventive ingennity in the arrangement and equipment of blacksmith shops as in any simila.· branch of the mechanical trades. In fact, we bclieve there is far more room for the display of taste and skill in this line than in some of the trades concerniog which volumes have been written. Yet the blacksmith's art does not possess a litcrature, because, we auppose, there has been nothing for authors to write about. In a trip of some 1,500 miles recently uadertaken, in which we visite dsome of the larger cities of the conntry, as well as a number of the smaller towns, we examined some 25 or 30 blacksmith's shops.

We took special note of the forges and tool benches; of the shop system; of the arrangement of the forges in the shops; of the position of the water and coal belonging to each forge, and of the various other points which would he obssrved hy one in search of practical information. We did not find any two shops in which the forges were arranged in the same manner. We did not find any two shops using the same style of forge, nor the same style of tool benches and tool racks. The methoda of the several foremen were as unlike as the several shops. If we had made sketches of each different forge, and of each different tool bench; if we had made diagrams of the arrsngement of all of their shops; if we had made notes of the different methods we saw employed in doiag the same kind of work, aad had printed cuts and description together in this issue, we would have made a number whicb would have been really sensational in character. And yct blacksmiths declare that they have nothing to write ahont. Each one supposes no one is interested in his methods and appliancss. This is a great mistake, as we happsn to know by practical tests. As we went from shop to shop we made it a rnle to tell the blacksmith of the place we were visiting something ahout one of the shops we had previonsly seen. Our remarks always commanded attention, and we never failed to excite enough interest to prompt some one to ask questions. If we happened to illustrate onr description hy an impromptn drawing they were all the better pleased. It was impossible for us to make the sketches as above suggested, nnd therefore our readers have not the opportunity of seeing how 25 or more shops are conducted. It is not impossible, however, for 25 or 50, or even 100 blacksmiths located in different sections of the country to send us diagrams of their shops, sketches of their forges and their tool henches and descriptions of their methods of workings. We are ready to make engravings and to print sucb descriptions. By this means our readers can compare notes. In one sense they can visit each other's shops. The trip we have above mentioned was to us quite interesting and instructive, and the counterpart of even more extended trips which our readers are able to furnish for themselves cannot fail to he profitable.—*Blacksmith and Wheelwright.*

New Departure in Finish of Railroad Cars.—A correspondent of the *Railroad Gazette* says: "The time is evidently ripe for a new standard of taste and a new method of finish in cars, and we may as well make the best of it. The movement is very plainly in the direction of greater simplicity, one wood simply ornamented hy cutting into its substance by hand work or hy machinery. Let us hope that it will take the direction of unobtrusiveness of general effects which shall not pusb themselves on our attention hy great contrasts or excessive 'style.' The car, which is simple and unobtrusive, will not have to he rebuilt in the next 5 or 10 years because its style bas become ridiculous, hut I fear some other cars will be under just this necessity, for the American people are changing in taste, as no mass of people ever did in so limited a time. It is, therefore, wise to keep on the negative side of the movement—simplicity and neutral tints—until the people have tired of the subject, and the craze has done its work and left some eort of etandard as a legacy to the future."

Glass Roofing.—In a paper publisbed in Germany hy the Hanover Society of Eogineers aad Architects, the comparative advantages and disadvantages of glass roofing are thoroughly considered. Hail, it appears, is not so damaging to such structurcs as is commonly supposed. It is seldom destructive of glass an eighth of an incb thick, and a thickness of a quarter of an inch is almost absolutely safe. The use of glass more than half an inch thick, bowever, has proved objectionable for roofing purposes, as it is said to he liable to spontaneous fractnre.

Car Construction.

A correspondent of the *National Car Builder* makeasome timely snggestions in regard to railroad car construction, from whicb we summa rise as followa: That we are on the eve of a radical change—perhaps *reform* wonld bo the most proper term—in railway practice, is evident even to ordinary observers. Any one whose iaterest, habits and training lead to a close observation of what is hsing done in the shops and on the roads, will notice the indications of snch a change on every hand. The initial movement in some directions has already hegun, snd preparations are making for a "jump, step and leap" in others.

Ono of the first of the more recsnt requiromants of an exacting nnd fastidious puhlio is faster trains. Fifty miles an hour will not do, and the permanent way and motive power of some roads have been improved and brought to a degrco of perfection by which a rate of speed has been attained in short rans, and under favorable conditions of grade, alignment, etc., of 76 miles nn hour. We have also a record of 111 miles beiag "done" frequently, almost daily in fact, at the rate of 68 miles an hour; and hundreds of miles are rnn at 60 miles an hoar. It is only on the best roads that these feats are performed. But there are thousands of miles that caa easily he put in condition to meet almost any demand for fast runniag that may be made; and many capable and enterprising managers are already giving their attsation to the matter. The first thiag to he looked after is the permanent way, next the motive power, and lastly car rolling stock.

In respect to the latter, it may he said that passenger oars as now constructed, are so well adapted to fast rnnniag that hut little change is needed: but some improvements may be necessary in order to lessen the destructive effects of collisions at high velocities. This may he done to a considerable extent by an improved constraction of the frame-work of cars. To prevent telescoping, the coupling mnst he hstter; to prevent the doubling ap and splintering of car hodies, the sills mnst be improved. Perhaps a combination sill made of wood, angle iron and channel hars strongly braced diagonally and strenthened laterally, with an abundance of tie-rods, wonld obviate much of the crushing effect of collisions and derailments.

With the increase of spsed the weight of cars is also increased, which may render it necssary to increase the size of axles. From 12 to 18 accidents are reported monthly from broken axles and wbsels, but more than 80% of brokeu axles are on freight trains, while the percentage of broken wheels on freight cars is not more than 60%. But, consideriag the numher of cars in use in each dspartment of the ssrvice, tbe numher of hreakages is largely on the side of passenger cars. This cannot he dne to overloading, but may be charged to shocks received in coming in contact with guard-rails and frogs at high vslocities. Fancy a strong man with a heavy sledge giving repeated hlows on the inner side of a wheel flange in the direction of tbe axis of the wheel. We should expect him to break the flange, at least, with a fair prospect of produciag a fracture in some other part of the wheel, and these hlows are light as compared with the ponnding the wbeels receive when hacking and gonging the ends of badly constrncted and misplaced guard-rails and frogs.

Tests of the Quality of Steel.

Almost every hlacksmith has his own rule hy which he determiaes the qnality of the steel which he uses. That these tests or rules are somewhat empirical in character is evident from the fact that a prejudice against a certain make of steel will often keep it out of nse in the shop, no matter what its actual merits may be. Some stories are told of the stratagems resorted to hy owners of works to accomplish the introduction of American steel at the time when all mechanics were violently prejudiced against it and in favor of the Eoglish article. Prejudicss of this kind, however, are not peculiar to hlacksmiths, hut extend to various other trades and industries.
